KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā	as in ale, fate.	ch	as in chair, cheese.
ā	" " senate, chaotic.	D	" " Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then.
â	" " glare, care, and as <i>e</i> in there.	g	" " go, get.
ă	" " am, at.	G	" " German Landtag = <i>ch</i> in Ger. ach, etc.
â	" " arm, father.	H	" <i>j</i> in Spanish Jijona, <i>g</i> in Spanish gila; like English <i>h</i> in hue, but stronger.
à	" " ant, and final <i>a</i> in America, armada, etc.	hw	" <i>wh</i> in which.
ɑ	" " final, regal, pleasant.	K	" <i>ch</i> in German ich, Albrecht = <i>g</i> in German Arensburg, Mecklenburg, etc.
æ	" " all, fall.	n	" " in sinker, longer.
ē	" " eve.	ng	" " sing, long.
ē	" " elate, evade.	N	" " French bon, Bourbon, and <i>m</i> in the French Etampes; here it indicates nasalizing of the preceding vowel.
ē	" " end, pet.	sh	" " shine, shut.
ē	" " fern, her, and as <i>i</i> in sir, etc.	th	" " thrust, thin.
e	" " agency, judgment.	TH	" " then, this.
i	" " ice, quiet.	zh	" <i>z</i> in azure, and <i>s</i> in pleasure.
i	" " quiescent.		
i	" " ill, fit.		
ō	" " old, sober.		
ō	" " obey, sobriety.		
ō	" " orb, nor.		
ō	" " odd, forest, not.		
o	" " atom, carol.		
oi	" " oil, boil.		
ōō	" " food, fool, and as <i>u</i> in rude, rule.		
ou	" " house, mouse.		
ū	" " use, mule.		
ū	" " unite.		
ū	" " cut, but.		
u	" " full, put, or as <i>oo</i> in foot, book.		
û	" " urn, burn.		
y	" " yet, yield.		
ʋ	" " Spanish Habana, Córdoba, where it is like English <i>v</i> but made with the lips alone.		

An apostrophe ['] is sometimes used as in tā'b'l (table), kǎz'm (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as G, H, K, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XV

- MANILA.**
Mr. Oscar Phelps Austin.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

MANICHÆ'ANS. See MANICHÆ-ISM.

MANICHÆ'ISM. A speculative religious system of western Asia, founded by Mani (q.v.) in the third century of our era. The ideas upon which it was based were mostly Persian (Zoroastrian), but it took some terms from Christianity. The Babylonian elements in it were not so great as was formerly supposed. There may also have been some traces from Buddhism, although this has been questioned by recent critics. The Christianity from which it borrowed was of the Gnostic type (see GNOSTICISM), and Manichæism has been called, not improperly, "the most complete Gnosis." Its western branch came closely in contact with the Church, and appropriated so many Christian ideas and usages that it was sometimes regarded as a heresy, although it was properly a rival system. It differed from Christianity, among other things, in its complete rejection of the Old Testament.

The dualism which Mani taught was radical and materialistic, postulating two opposite original domains, represented respectively by light and darkness, good and evil. They are from eternity contiguous, yet distinct and separate. The kingdom of light included both a heaven and an earth, the latter guarded by good angels (*æons*). This kingdom has its Good Spirit, or God, whose attributes are set forth in a series of 10 (some say 12) virtues. It is not certain that Mani assumed a second god for his kingdom of darkness, but this kingdom was at least personified, and from it sprang Satan and the evil demons. There is an earth of darkness, analogous to the earth of light, and its five qualities—all obviously evil—are mist, heat, the sirocco, darkness, and vapor. What might be called the equilibrium of the two kingdoms was destroyed by Satan, who overstepped his own boundaries and invaded the light realm. To oppose him God created "primal man," who should be the champion of the invaded kingdom and fight its battles against the evil demons. All this is the prelude to human history.

Mankind came into existence after a long cosmic process, everywhere attended by disturbance and disaster. He is the creation of Satan, who placed in him all the light elements under his control in order to imprison them. Light and dark elements had already become entangled

with one another and the conflict had begun before the creation of our present world, but with the advent of humanity it began to wax keener and more tragic. The destiny of the race is to have its light portions finally liberated, which result will accompany the restoration of the lost cosmic order in the universe. Some of the accounts represent the signs of the zodiac as playing an important part in gathering together the scattered particles of light. We also hear of a great final catastrophe, which shall bring the whole process to an abrupt conclusion. The influence of a docetic Christianity appears in Western Manichæism in the notion of the "Jesus patibilis" and "impatibilis." The former term was applied to the light which had become diffused throughout the world. By a peculiar application of the proper name Jesus the sum total of these particles came to be regarded as a being capable of suffering, and actually enduring it, through contact with evil matter. The other term, "Jesus impatibilis," means a sort of phantom, attendant upon the historic Jesus, but not partaker of his human experiences or sufferings. He was rather a messenger descended from the realm of light to aid in the world's redemption. In this work other prophets had taken part, and to crown the series Mani himself appeared, the final prophet of human history. Salvation consists in knowledge of the true nature of the universe and in the final separation of spirit (light) from matter (darkness).

The Manichæans fall into two classes, the *perfecti*, or fully initiated members of the society, and the *auditores*, hearers or novitiates. The hearers constituted by far the larger body, and held the "perfect" in the highest veneration. St. Augustine, before his conversion to Christianity, was for nine years a Manichæan hearer. The elect followed the ascetic rule of life, being distinguished by their threefold "seal" of mouth, hands, and bosom. The *signaculum oris* required abstinence from all defilement through evil speech or animal food; the *signaculum manuum*, abstinence from all avoidable contact with the material world; and the *signaculum sinus*, abstinence from marriage and from all sexual indulgence. The uninitiated were satisfied with a less exacting moral standard, and lived very much as other men and women do.

The Manichæans were organized under a sort of hierarchy, in some respects like that of the Catholic church. Augustine tells us of a graded

system of officers, including 12 teachers, 72 bishops, and a number of elders. Above them all stood one supreme authority, for a long time resident in Babylon, but afterward in Samarkand, who was apparently regarded as the representative of Mani. The worship of the Manichæans was not elaborate. It included, besides the ordinary service of prayer and song, an initiatory rite of baptism, in which oil was used instead of water, and a eucharistic meal. Fasting was emphasized as very important for the elect. An annual festival, called the *Bema*, commemorated the death of the founder, Mani.

From the latter part of the third century Manichæism spread rapidly within the Roman Empire. Among its early adherents were survivors of the Gnostic sects, especially the Marcionites. (See MARCION.) It also won converts from the non-Christian educated classes of Europe, and in Africa even clergy embraced its teachings. By the end of the fourth century it had become one of the three great world systems, competing with Neo-Platonism and Christianity for religious and intellectual leadership. The most notable of its early Christian opponents were Titus of Bostra, Metropolitan Bishop of Arabia, and St. Augustine. The Roman government took measures against the Manichæans almost from the beginning. Diocletian issued an edict against them, commonly dated about 287. Valens (364-378) issued other similar decrees. Manichæans were condemned to exile under Valentinian III (425-455) and to death under Justinian (527-565). But nothing seemed capable of crushing the movement. It survived even the attacks of Islam, and flourished in Asia beyond the tenth century, whence some traces of it came into Europe in the heresies known under the names of the Paulicians, Bogomiles, Cathari, and Albigenses (qq.v.). For references to the literature, see MANI.

MANIÈRE CRIBLÉE, *mā'nyâr' krê'blâ'* (Fr., sieve fashion). Probably the oldest process of engraving upon metal for the purpose of printing. It derives its name from the white dots with which the dark ground of the print is covered, resembling the holes of a sieve. These dots, which form the outlines of the engraving, were beaten into the plate by means of a punch, the parts hollowed out forming a light image on a dark ground. The plates were made of some soft metal, like brass. The earliest examples of prints, of the Bibliothèque Nationale (Paris), are from Cologne, where the art may have originated, in a manuscript dating at latest from 1406. The *manière criblée* continued to be practiced as late as the first quarter of the sixteenth century, but was never an important factor in the development of engraving.

MANIFEST (Lat. *manifestus*, evident), **COMMERCIAL**. A document, in commercial navigation, delivered to the officer of customs by the captain of a ship, which gives a list in detail of the cargo in his charge, with the names of the places where the goods were shipped and to which they are addressed.

MANIFESTO (It., *manifest*). In international law, a declaration or formal statement of policy or intention which it was formerly customary for a belligerent to publish within its own territory or to communicate to other states through diplomatic agents. With modern conditions of intercommunication, such a formal notification has become less imperative, although commercial interests and international

courtesy often render it desirable. See DECLARATION OF WAR.

MANIFOLD, IN MOTOR VEHICLE. See MOTOR VEHICLE.

MANIFOLD WRITER. See COPYING MACHINES AND PROCESSES.

MANIHIKI ISLAND. See MANAHIKI ISLAND.

MANIHOT. A genus of about 80 species of tall herbs and shrubs of the family Euphorbiaceæ, natives of South America. The best-known species are cultivated in warm climates for their underground parts, which yield a starch known as Brazilian arrowroot, and cassava (q.v.). Other species are rubber-producing plants. See Plate of CARNATIONS, ETC.

MANILA, *Sp. pron. mā-nē'lā*. The capital of the Philippine Islands. It is situated on the west coast of the island of Luzon, at the east end of Manila Bay, at the entrance of the river Pasig, in lat. 14° 35' N. and long. 120° 58' E. (Map: Philippine Islands, C 3). The city occupies part of an extensive plain on both banks of the Pasig, and is surrounded on the land side by a semicircle of picturesque mountains. It is divided by the Pasig into two parts, the old walled city and the suburbs. The former lies on the south bank of the river and is surrounded by an old wall with bastions and parapets built about 1590. The wall is 2½ miles long and is pierced by six gateways with drawbridges. The use of the drawbridges was discontinued about 1850 and the moats on the land side of the walls were filled with earth in 1905 for sanitary reasons. The city is surrounded by Manila Bay on the west and the Pasig on the north. The walled city contains the principal public buildings, such as the government offices, colleges, the weather observatory, the archbishop's palace, and the cathedral. The aspect of the old city, essentially mediæval, has materially changed since American occupation. Separated from the old city by the Pasig is Binondo, the centre of the commercial as well as of the industrial activity of the metropolis. Here are situated the principal warehouses, cigar and tobacco factories, the business houses of the European trading companies, and the principal shops. North of Binondo lies the suburb of Tondo, where the working population of the capital lives, chiefly in small houses built of cane and palm leaves. San Miguel, situated on an island formed by an arm of the Pasig, is the fashionable suburb of Manila and contains the fine residences of the wealthy merchants and officials.

Several bridges cross the Pasig from the suburbs, the principal being the Bridge of Spain, a handsome stone structure with a number of arches, leading from Binondo. At the south end of this bridge, and stretching along the Pasig outside the city walls, is the Paseo or Plaza de Magallanes, containing an obelisk erected to the memory of the discoverer of the islands. From this plaza a handsome paseo stretches in a semicircle and terminates on the bay front south of the city, where there is a park and promenade called the Luneta, which is lighted by electricity. Most of the streets of Manila are broad and cross at right angles, and have been greatly improved since American occupation. The street railways are operated by electricity, the streets are well lighted and paved, and by a thorough system of drainage the healthfulness of the city has been greatly improved. Among the buildings of Manila the most prominent is the cathe-

dral, destroyed by the earthquakes of 1863, but rebuilt. The customhouse is a handsome building, also rebuilt since 1863. The best buildings are, as a rule, the convents and some of the churches. Manila is the intellectual centre of the entire archipelago, and has, besides the University of St. Thomas (see MANILA, UNIVERSITY OF), the College of San Juan de Letrán, the medical and pharmaceutical school of San José, a general hospital built and operated by the government, a leper hospital, a hospital for contagious diseases, training schools for nurses, normal schools, a large military hospital, a home for convalescents, an insane asylum, and the excellent and spacious hospital of San Juan de Dios. The water supply of the city has been greatly improved since American occupation, the water being brought from the Mariquina River 25 miles away to a large storage reservoir about 200 feet above sea level. The drainage system has also been greatly improved, the sewage being discharged into the bay more than a mile from shore by a pumping system.

The chief manufactures are cigars and cigarettes, furniture, boots and shoes, products of the famous Manila hemp or abaca, and some textiles. Iron foundries, machine shops, and various milling establishments are also flourishing. Manila's future, however, will depend chiefly on its commerce. Its harbor has been greatly improved under American rule, by the construction of breakwaters or jetties inclosing about 350 acres of harbor area and dredging this to a depth of 30 feet, and the construction of steel wharves 650 feet long and about 100 feet wide. The Pasig River has also been dredged to a depth of about 20 feet, and the Manila harbor may now be considered the best and most modern in that part of the Orient. The city has steamship communication with many of the great ports on both sides of and in the Pacific Ocean. The larger commercial houses are conducted by Americans and by Spaniards or other Europeans, while the small trade is mostly in the hands of the Chinese, who are very prominent in the commercial activity of the city. Manila exports mainly sugar, hemp, tobacco and cigars, coffee, dyewoods, and precious metals. It is the greatest hemp market of the world. The imports are rice, cotton goods, chemicals, machinery, metal goods, and wine. The trade is chiefly with China, the United States, and Great Britain, the share of the trade with the United States having greatly increased with the removal of all duties on Philippine products entering the United States and the admission duty free into the Philippines of all domestic merchandise from the United States. The population of Manila and suburbs, according to the census of 1903, was 219,941, of whom 189,782 were Filipinos, 21,230 Chinese, 4389 Americans, 2528 Spaniards, and 1117 other Europeans. In 1910 the population was estimated at 234,400. Manila is the centre of a railway system of 475 miles and with its excellent harbor facilities is the chief entrepôt of the Philippine group. A very large share of the \$56,000,000 worth of imports and \$53,000,000 worth of exports of the islands enters or leaves this harbor. The city received its new charter of incorporation from the Philippine Commission on July 31, 1901, by which the government is vested in a municipal board appointed by the civil Governor of the islands. There is an excellent school system, established by the Americans after assuming control of the islands.

Manila existed as a palisaded native town under the name of Mainila when it was first visited by the Spaniards. In 1569 Juan de Salcedo, a nephew of Legazpi, the conqueror of the Philippines, made an unsuccessful attempt to found a Spanish colony in the town. In 1571 Legazpi himself appeared in the harbor with a Spanish fleet and was admitted into the town by the two native chiefs, who rendered homage to Spain. Legazpi at once strengthened the fortifications and built a church and a number of houses for the Spaniards, and in the same year a municipal government was inaugurated with great solemnity. The city in 1574 was sacked and burned by Chinese pirates; in 1590 the present permanent fortifications were begun. In 1602 an insurrection of the Chinese residents of the city was put down with great severity, several thousands of the insurgents being killed. The same year the city was blockaded by the Dutch. In 1762 it was captured and sacked by the English, who occupied it until 1764.

Towards the end of the nineteenth century Manila became the centre of secret agitation for the overthrow of Spanish sovereignty. Many arrests were made; on Sept. 2, 1896, 13 prominent Filipino citizens were shot at Cavite, and on December 30 Dr. Rizal was executed at Manila. On Aug. 30, 1897, a skirmish with the insurgents took place on the outskirts of the city, which was then declared under martial law. On May 1, 1898, Dewey destroyed the Spanish fleet in Manila Bay—an event which was the signal for a great uprising of the Filipinos against Spanish rule, under the lead of Aguinaldo, and on August 13 the city capitulated to the American forces. It was placed under a military government and policed by a provost guard of American soldiers. During the winter of 1898-99 the city was practically in a state of siege by Aguinaldo's forces until the actual outbreak of hostilities, which began with an unsuccessful attack of the Filipinos upon the Americans at Manila, on Feb. 4-5, 1899. The actual transfer of the military government to the new civil authorities took place on Aug. 7, 1901. In 1914 the constabulary discovered a well-organized native plot to revolt, with headquarters at Manila. About 30,000 Filipinos were involved. It was frustrated by the arrest of several leaders after an abortive attack on the police in the Botanical Gardens.

Manila has a number of times suffered from earthquakes, the most terrible of which occurred on June 3, 1863, when all the prominent buildings were destroyed and several thousand persons killed. Consult the authorities referred to under PHILIPPINE ISLANDS.

MANILA, UNIVERSITY OF (or UNIVERSITY OF ST. THOMAS). A university in Manila which owes its origin to Philip II of Spain, who in 1585 gave permission for its foundation. In 1601 a seminary for nobles was opened here, and in 1611 the Dominicans, supported by the Archbishop of Manila, established the College of St. Thomas for natives and poor Spaniards. In 1619 the college received papal permission to grant degrees and in 1644 was converted into a university. The present institution, however, dates from 1857 and was built up on the basis of the old. In 1871 schools of medicine and pharmacy were added. The university is now organized on the model of similar American institutions and has faculties of theology, canon and civil law, medicine, pharmacy,

philosophy and arts, and engineering. In 1912 the university had an enrollment of 767 students, of whom 655 were in the colleges of law and medicine.

MANILA BAY. A large and beautiful inlet of the China Sea, running into the southwestern coast of Luzon (Map: Philippine Islands, C 3). It has, roughly, the shape of a triangle with its base line, 37 miles long, forming the head of the bay from southeast to northwest, while its apex is at the entrance, which is 11 miles wide. The depth of the bay from the entrance to the base is 25 miles. The land on both sides of the entrance and along the west shore is high and forested; that on the east and north is low, and the north shore especially consists of the marshy delta of the Río Grande de la Pampanga, which enters the bay through numerous mouths, between which tall reeds grow far out into the shallow water. The greater part of the bay, however, has deep water, with good and ample roadsteads at Manila and Cavite, and for harbor purposes it is the finest in the Far East. The entrance is well lighted by a large lighthouse on Corregidor Island and another on the smaller island of Caballo. The bay connects through the Pasig River at Manila with the large Bay Lagoon in the interior of Luzon. Manila Bay was the scene of the victory of Admiral Dewey over the Spanish fleet on May 1, 1898. See SPANISH-AMERICAN WAR.

MANILA FIBRE, or MANILA HEMP. See HEMP, MANILA.

MANILIAN LAW. A law proposed at Rome in 66 B.C. by the tribune Gaius Manilius, providing for the recall of the commanders then in Asia, where the Romans were fighting Mithridates, and for the extension of Pompey's power over all the East. Pompey was then in the East, clothed with large powers against the Cilician pirates (see CILICIA); Manilius proposed to give him command against Mithridates also. Cicero made his first address to the people in support of the proposition of Manilius. The speech, *Pro Lege Manilia*, or *De Imperio Cn. Pompeii*, is admirable in form, far superior in this respect to the orations against Catiline. It throws much light also on the operations of the publicani (q.v.).

MANILIUS, MARCUS. The supposed name of the author of a Latin poem on astrology entitled *Astronomica*. Nothing is known of his personality, but from the poem itself it is inferred that he lived in the reigns of Augustus and Tiberius. Five books of his poem are preserved, treating of the constellations and their influence on human life. The work is of no great poetic value, but exhibits great learning and diligent research in the works of the best authorities. The writer imitates Lucretius and has much of that author's enthusiasm and power to enliven a difficult subject. There are several editions, including those of Scaliger (Leyden, 1579 and 1600), Bentley (London, 1739), Jacob (Berlin, 1846), and Breiter, with Commentary (Leipzig, 1907-09), and an edition of Book ii by Garrod (Oxford, 1911). There is an English translation by Creech (London, 1697). Consult: Lanson, *De Manilio Poeta* (Paris, 1887); R. Ellis, *Noctes Manilianae* (Oxford, 1891); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part ii (3d ed., Munich, 1913).

MANIN, mā-nēn', DANIELE (1804-57). An Italian patriot. He was born in Venice, May 13, 1804, studied at the University of Padua, and

was admitted to the doctorate of laws at the age of nineteen. He was then admitted to the bar, of which his father, Pietro Manin, was an eminent member. After 1831 he became a recognized leader of liberal opinion in Venice. In 1847 his reputation as a political economist was established during the sittings of the scientific congress at Venice. Shortly after he was thrown into prison for a spirited public address against Austrian domination. Previous to the rising against Austria of 1848 Manin was for a second time imprisoned, but when the news came of the revolution in Sicily and of the February revolution in France he was released in triumph by the populace, was placed at the head of the patriotic movement, and was invested with supreme power as President of the restored Republic of St. Mark. The organization of a civic guard and the expulsion of the Austrians from the arsenal were Manin's first public measures. At the same time he prevented the mob from murdering their former oppressors. Manin devoted himself energetically to the organization of the inhabitants for self-defense. For a short time he had to give way to more radical leaders, but was soon recalled. During the invasion of Lombardy by Charles Albert of Sardinia Manin laid down his authority; but on the defeat of the Sardinian army at Novara, March 23, 1849, he resumed power, and was the animating spirit of Venice during the heroic defense of the city for four months against the besieging Austrian army. On August 23 Venice capitulated; but Manin, with 40 of the principal citizens, being excluded from the amnesty, quitted the city. Having lost his fortune in the defense of Venice, he retired to Paris, where he taught his native language, declining innumerable offers of aid. He died there, Sept. 22, 1857. Manin's public career was one of complete unselfishness. Believing as strongly as Mazzini in a republic, he was yet wise enough to see Italy's need, and from his exile in Paris he urged upon his compatriots coöperation with the Sardinian monarchy in effecting the union of Italy.

MAN'ING, FREDERICK EDWARD (1812-83). A New Zealand judge, born at Johnville, County Dublin, Ireland. His father emigrated with his family to Tasmania in 1824 and in 1833 young Maning settled among the Maoris of New Zealand. He became a favorite of the natives; was adopted into their tribe; and later he married a Maori wife. He gave good advice to both sides in the wars of 1845 and 1861. From 1865 to 1881 he was judge of the native land courts. A victim of cancer, he returned to England in 1881 and there died. Much credit is due to Maning for the knowledge that has been gained

of the Maoris through his books, *Old New Zealand* (1876; 6th ed., 1906) and *The History of the War in the North with Heke in 1845* (3d ed., 1884).

MAN IN THE IRON MASK, THE. See IRON MASK.

MAN'IOC (*Manihot utilissima*). A South American plant, of the family Euphorbiaceæ. Its starchy underground stems are used to make tapioca. See CASSAVA; Plate of CARNATIONS, ETC.

MAN'IPLE (OF. *maniple*, Fr. *manipule*, from Lat. *manipulus*, handful). 1. A narrow strip of silk worn on the left arm by the sacred ministers in a solemn mass. Originally it was a mere linen handkerchief, but since the eleventh century it has been made of the same material and color as the chasuble. When a bishop celebrates mass pontifically he assumes the maniple only at the *Confiteor*; otherwise it is put on in the sacristy with the other vestments. See COSTUME, ECCLESIASTICAL. 2. In the Roman military organization the legion (q.v.) was divided into 30 maniples, each commanded by a centurion, and consisting of about 100 men in the case of the regular infantry and 40 men among the *velites*, or light-armed skirmishers.

MANIPUR, mā'nē-pōōr'. A native state of northeast India, situated between Assam and Upper Burma, and called by the Burmese Cassay or Kathe (Map: Burma, B 2). Its area is 8456 square miles. It consists chiefly of a deep valley 2500 feet above the sea. The industries are purely agricultural, the chief products being tea, cotton, rice, tobacco, opium, and indigo. The state is administered by a rajah, but has been a political dependency of Assam since 1825. In 1891, during the disputed succession to the throne, the British Commissioner Resident, and several officers were treacherously murdered; a punitive expedition hanged the ringleaders, settled the succession, and resumed the administration under British supervision. Pop., 1901, 283,957; 1911, 346,222, chiefly Hindus. Capital, Manipur.

The natives of Manipur consist of Manipuris proper, Nagas, and Kukis, all of whom are by tradition assigned to a common ancestry. The Manipuris call themselves Meithei, and since their conversion to Hinduism in the beginning of the eighteenth century they claim a Hindu origin. They are of the Mongoloid type of feature and do not resemble the Aryan or Aryanized peoples of Hindustan. Their language is closely allied to the Chin, Lushai, and Kuki tongues. Among the Meithei clan worship of tribal deities and peculiar rain ceremonies prevail, and ancestor worship was probably once in vogue. Each tribe seems to have a rain rite of its own. The Kukis are still migratory, but the Nagas live in permanent villages. Terrace cultivation with irrigation channels occurs in Manipur. The Nagas of Manipur and the mountains to the north are essentially Indonesians, and the Lushai of the south are Nagas mixed with Kyens and Burmese of Arakan. The game of polo was formerly almost peculiar to Manipur and the state was once famous for its breed of ponies. Consult: Grimwood, *Three Years in Manipur* (London, 1891); Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872); Reid, *Chin-Lushai Land* (ib., 1883); Sir James Johnstone, *My Experiences in Manipur and the Naga Hills* (London, 1896).

MANIPUR, or IMPHAL. The capital of the

native State of Manipur (q.v.), on the Namkathay River, 236 miles northwest of Mandalay (Map: Burma, B 2). The town is encircled by a wall and is the centre of a populous district. An export trade is carried on in cattle, tea, and rice. Here in 1891 occurred the massacre of British officials, which led to a change of administration and the establishment of a military cantonment. Pop., 1901, 67,093; 1911, 74,650.

MAN'IS (Neo-Lat., assumed sing. of Lat. *manes*, ghosts; so called from the animal's nocturnal habits). The ordinary and generic name of the scaled anteaters or pangolins of the Old World edentate family Manidae. Seven species are recognized, all inhabiting the tropical parts of Asia or of Africa. In general structure and habits they resemble the American anteaters (see ANTEATER), but are singular in having the body covered with horny imbricated scales, between which (except in the adults of the African

LONG-TAILED MANIS OR PANGOLIN.

forms) grow hairs; these scales are sharp-edged and are large upon the trunk and long terete tail, but small on the head, neck, and limbs. A common name is scaly anteater. Their legs are short and strong, and their feet armed with powerful claws, with which they burrow, and in walking those of the forefeet are turned under. They feed, always at night, exclusively on ants and termites, which they procure by means of their long viscid tongue. All are able to roll themselves into a ball, which a man's strength is unable to open, and thus they present to their enemies only an armored surface, after the manner of armadillos. The largest species are those of Africa, and live upon the West Coast, one (*Manis gigantea*) reaching a length of 6 feet, including the tail. The one called phatagen by the ancients was probably the long-tailed manis (*Manis macrura*). A third, the short-tailed (*Manis temminckii*), ranges all across south Central Africa. The three Asiatic species are little different. One, common in India (*Manis pentadactyla*), has a body 2½ feet long and dwells in rocky places. A second species ranges eastward to China, and a third, more slender and long-tailed (*Manis javanicus*), is the one originally called by the Malays pangolin, a term often now applied to the whole genus. They do not live well in captivity and show but little signs of intelligence. Consult writers on the zoölogy of India and Africa; also W. T. Hornaday, *Two Years in the Jungle* (New York, 1885); F. E. Beddard, *Mammalia* (London, 1902); C. W. Beebe, in *New York Zoölogical Society, Bulletin*, vol. xvii (New York, 1914).

MANIS'SA, or MANISA (the ancient Magnesia ad Sipylum: see MAGNESIA, 1). A town of Asia Minor, in the Vilayet of Aidin, 40 miles northeast of Smyrna, with rail connection (Map: Turkey in Asia, A 2). It has numerous mosques, one Armenian and several Greek churches, four

synagogues, and several notable secular buildings, among them the palace of Kara Osman Oglu. The chief industries are the manufacture of cotton goods and pack saddles. Pop., about 35,000, including 13,000 Greeks, 6000 Armenians, and 3000 Jews. For history and archæology, see *MAGNESIA*, 1. Consult Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., Leipzig, 1914).

MANISTEE, măn'is-tē'. A city and the county seat of Manistee Co., Mich., 114 miles by rail northwest of Grand Rapids, on the Manistee River, which flows between Manistee Lake and Lake Michigan, a distance of 1 mile, and on the Pere Marquette, the Manistee and Northeastern, and the Michigan East and West railroads (Map: Michigan, C 4). It has a fine harbor and regular steamship communication, during the open season, with Chicago, Milwaukee, and other points on the lake. The city is in a fertile fruit-growing region, and its excellent transportation facilities have developed large commercial interests, particularly in lumber and salt, which are manufactured on an extensive scale. There are manufactures also of furniture, foundry products, vacuum pans, and sole leather. The principal features of interest are a fine courthouse, Carnegie library, Mercy Hospital, Home for Aged Women, Federal building, two bridges across the Manistee River, and Orchard Beach, a popular lake resort. Settled about 1849, Manistee was chartered as a city in 1869 and adopted the commission form of government in 1914. The city owns and operates the water works. Pop., 1900, 14,260; 1910, 12,381.

MANISTIQUE, măn'is-tēk'. A city and the county seat of Schoolcraft Co., Mich., 107 miles by rail west by south of Sault Ste. Marie; on Lake Michigan, at the mouth of the Manistique River, and on the Minneapolis, St. Paul, and Sault Ste. Marie, the Ann Arbor, and the Manistique and Lake Superior railroads (Map: Michigan, C 3). It has some reputation as a summer resort, but is known chiefly as an industrial and commercial centre, its trade being carried on both by rail and lake. There are limekilns, ironworks, and manufactories of lumber, chemicals, alcohol, cedar products, and charcoal. The fishing interests also are important. There are municipally owned water works and a public library. Manistique received a city charter in 1901. Pop., 1900, 4126; 1910, 4722.

MANITO. See **MANITOU**.

MANITOBA, măn'itō'bā. A province of the Dominion of Canada, extending from the international boundary line to Hudson Bay, situated between 49° and 60° N. lat. and between 92° and 101° 20' W. long. (Map: Canada, L 5, 6). It is bounded on the north by the Northwest Territories, on the east by Ontario, on the south by the States of Minnesota and North Dakota, and on the west by Saskatchewan. Area, 251,832 square miles, including 19,906 square miles of water.

Topography. The province belongs to the great central prairie region in the south and west, and in the east and north it is a part of the Laurentian country, broken and hilly, with a higher altitude than the adjoining region. The southeastern part consists of an almost perfectly level lacustrine bed, the bottom of the Pleistocene Lake Agassiz. (See **LAKE AGASSIZ**.) It slopes very gently northward, being 800 feet above the sea in the south and 710 feet in the north. Its western boundary is formed by a

line of escarpments with a maximum height of 500 feet above the plain and running southeast to northwest. These are the ancient shore lines of Lake Agassiz, and above them stretches a more elevated and undulating plain known as the Riding and Duck Mountains, which cover the western and southwestern parts of the province. Both this plain and the lacustrine plain below are treeless prairies, becoming gradually wooded northward, first along the river courses and in isolated clumps of poplars, and finally thickening into dense pine forests on the Duck Mountain in the northwest. The principal river is the Red River of the North, which enters the province from the south and flows through the prairies into Lake Winnipeg in the southern part of the province. Its chief tributary is the Assiniboine, cutting through the western upland. Nearly all the rivers of the province have cut their beds through the soft drift deposits, so that they flow in narrow valleys from 30 to nearly 100 feet below the surrounding plains. As the waters of Lake Agassiz were drained off the lowest depressions of its bed remained flooded and now form the great lakes of the province. Of these Lake Winnipeg is 270 miles long and from 20 to 60 miles broad, Lake Winnipegosis 150, and Lake Manitoba 135 miles long. The last named is very shallow, and the shores of all are low and marshy.

Climate. The climate is very cold in winter and warm in summer. The mean annual temperature is 33° F., and the extremes 95° F. and 40° or even 50° below zero F. Both extremes, however, are rendered bearable by the dryness of the air; and the winter cold does not interfere with the wheat crops, as the sowing season arrives here even earlier than in the eastern provinces which lie farther south. The mean annual rainfall is only 17.43 inches, but 74 per cent of it falls in growing seasons, the winters being dry and sunny and the snowfall light.

Geology and Minerals. The Laurentian system of ancient crystalline rocks extends into the northern and eastern part of the province, from the east shore of Lake Winnipeg nearly to Hudson Bay. It is bordered by a belt from 60 to 120 miles wide of Silurian and Devonian limestones running from southeast to northwest through the east-central part of the province and forming the western shore of Lake Winnipeg. The remainder of the plains consists of Cretaceous and Laramie formations. Nearly the whole surface, however, is covered with a thick deposit of glacial drift. The principal minerals are lignite and coal, which are mined to some extent along the Souris River, near the southern boundary. By a recent law the settlers are allowed to mine for home use the outcropping coal on public lands by paying a small royalty to the government. Some deposits of iron are also found, but are not worked. Extensive deposits of gypsum have been found in the Dauphin District, north of Lake St. Martin. Gold is found near the east boundary, in the Lake of the Woods area. Brine springs exist on the peninsulas in the southern part of Lake Winnipegosis, but no salt has been manufactured.

Soil and Productions. The poor soils characteristic of the Laurentian region prevail in the eastern part of the province, and in the hills to the west the soils are also of a poor quality. Over the greater portion of the western plains the soil consists of a very deep mold or loam with a tenacious clay subsoil. The best quality

MANITOBA

SCALE OF MILES
0 10 20 30 40 50
Railways thus:

is found in the Red River valley, which was formerly the bed of Lake Agassiz, and the soil of which is therefore a lake deposit. The Red River valley has become famous for its enormous production of the finest qualities of wheat. The region farther to the west also produces abundantly and contains vast fields of wheat.

Agriculture. The main economic interests of the province centre in agriculture. The harder grain and root crops are grown with great success, but the season is too short for corn. In extent of area the annual crop of wheat is greatly exceeded by many American States, but the grade of wheat is unexcelled. Oats are also extensively grown, and barley, potatoes, and flax are important crops. The increase and variation of acreage of the leading crops are shown in the following table.

	1913	1911	1901
Wheat.....	2,804,000	3,094,833	1,965,200
Oats.....	1,798,000	1,307,434	573,858
Barley.....	496,000	448,105	139,672
Forage crops.....	177,000	166,615	43,667
Flax.....	54,000	79,765	14,404
Potatoes.....	26,000	26,488	16,042

The decline in wheat acreage in 1913 is due in part to the growth of mixed farming and stock raising. The grasses, both natural and cultivated, grow luxuriantly and afford excellent pasturage. The variation in the number of domestic animals is shown in the following table, taken from official returns.

	1913	1911	1901
Horses.....	304,088	280,374	163,867
Milch cows.....	152,792	155,337	141,481
Other cattle.....	256,926	279,776	208,405
Sheep.....	42,840	37,322	29,464
Swine.....	184,745	188,416	126,459

The figures in the above tables for 1901 and 1911 are taken from the census for those years respectively, and those for 1913 are the estimates of the Census and Statistics Office, Ottawa.

The value of the butter and cheese product in 1910 was \$593,375. In 1910 there were produced 694,712 pounds of cheese, valued at \$81,403. In 1910 the butter production was 2,050,487 pounds, valued at \$511,972.

Game and Fisheries. Large numbers of game and fur-bearing animals continue to abound in the north (a region now known as New Manitoba) and are profitably hunted. They include the deer, antelope, elk or wapiti, moose, reindeer or caribou, marten, mink, fisher, and muskrat. Duck, grouse, quail, woodcock, and plover are found in great numbers. Of greater importance are the resources of fish in the large lakes. Large quantities of whitefish, pickerel, sturgeon, and other varieties are caught annually. Assistance from the Dominion government is given for the development of markets for fresh fish in the interior of the provinces by payment of one-third of the ordinary express charges from the Atlantic coast on shipments of fresh fish as far west as the east boundary of Manitoba and from the Pacific coast as far east as that boundary. Manitoba has four of the 51 fish hatcheries supplied by the Dominion government. The value of the Manitoba catch in 1913 was \$800,149.

Transportation, Manufactures, Banks. The Dominion, provincial, and municipal governments have aided in the construction of railroads and an admirable system has been developed in the southern portion of the province and is being extended northward. The Canadian Pacific, Grand Trunk Pacific, and Canadian Northern pass through it and establish communication with both the Atlantic and Pacific oceans. Branch lines of the Northern Pacific Railroad pass up the Red River valley and establish connection with the railroad systems of the United States. The National Transcontinental enters Manitoba on the east boundary and runs to Winnipeg. A railway line was under construction by the Dominion government in 1914 from Le Pas in Manitoba to Hudson Bay. There were, in 1913, 3993 miles of steam railway in operation in Manitoba and 872 miles in course of construction. The large lakes to the north, together with the Saskatchewan River system, afford possibilities for an extensive development of water communication with the region to the north and west—possibilities which have only just begun to be realized. The Red River to the south and the Assiniboine to the west are also navigable during the high-water season, but have been little used since the construction of railroads. Enormous quantities of wheat are annually exported to English markets, and exports of hard wheat to the United States for milling purposes and for mixing with the softer varieties of wheat show a substantial increase.

The manufacturing industries, which in 1900 were chiefly represented by flour and lumber mills, had increased in 1905 to 354 establishments, with \$27,517,297 invested capital, employing 10,333 hands, with salaries and wages of \$5,090,791 and an output valued at \$28,155,732; in 1910 there were 439 establishments, an invested capital of \$47,941,540, employing 17,325 hands, paying \$10,912,866 in wages and salaries, and with an output valued at \$53,673,609. Winnipeg in 1910 was the fourth manufacturing city in Canada.

In 1914 the bank branches located in Manitoba numbered 205. In 1913 the clearing-house transactions at Winnipeg amounted to \$1,634,977,237, making this place third among Canadian commercial centres in the importance of its clearing-house transactions.

Population. The population of Manitoba has been acquired almost wholly since 1870. In that year there were only 2000 whites in the province and an Indian half-breed population of about 10,000. In 1881 the population had increased to 62,260, in 1891 to 152,506, in 1901 to 255,211, and in 1911 to 455,614. In 1911, of the total population of 455,614 those born in Canada numbered 264,828 and those born in the British Isles and possessions, 91,606; the foreign born numbered 95,688, of whom 78,051 were born in continental Europe and 16,326 in the United States. There were 10,822 Indians in 1913. Winnipeg had in 1911 a population of 136,035; Brandon, 13,839; Portage la Prairie, 5892; and St. Boniface, 7483.

Government. The government of Manitoba consists of a lieutenant governor, appointed by the Governor General in Council of Canada, an executive council of seven members, responsible to the provincial Legislature, and the Legislative Assembly of 41 elective members. The seat of government is Winnipeg. Up to 1890 French

was the official language used by the Legislature. The common law of England is in force in the province. Manitoba sends four Senators and 10 members of the House of Commons to the Dominion Parliament. Practically universal manhood suffrage exists, and the time requirement is one year in the province and three in the electoral division. The judicial system consists of the Court of Appeal, with a chief justice, who ranks as chief justice of Manitoba, and four minor judges; the Court of King's Bench, with a chief justice and five minor judges; and also surrogate courts, county courts, police magistrates, and justices of the peace. The rural regions are organized into townships, and the denser units of population are organized into villages, towns, or cities, according to number of inhabitants. In each of these the governmental affairs are intrusted to a council (called board of aldermen in cities), as is true also of the counties, the members of the county council being elected by the townships and villages.

The receipts and expenditures show a gradual increase from less than \$900,000 each in 1880 to \$5,788,070 and \$5,314,849 respectively for the year ended Nov. 30, 1913. The principal items of revenue were as follows: the Dominion subsidy, \$1,349,895; provincial telegraph and telephones, \$1,814,407; sales of provincial lands, \$323,769; land titles, general fees, \$328,137; liquor licenses, \$162,466; succession duties, \$268,009; railway tax, \$205,358; interest on school land funds, \$237,488. The principal items of expenditure were: public works, \$1,322,963; education, \$668,832; Treasury Department, \$798,837; Department of Agriculture and Immigration, \$411,781; Attorney-General's Department, \$563,491. The Dominion subsidy, which forms a large part of the receipts, was increased by reason of the extension of Manitoba's boundaries in 1912. On Nov. 30, 1912, there were 1296 prisoners and insane persons in provincial institutions. Of charitable institutions the province maintains in whole or in part 11 general hospitals, two orphanages, a home for incurables, a deaf and dumb institution, a woman's home, and a Salvation Army rescue home. One of the five Dominion penitentiaries is located in the province.

Public Utilities Commission. An important measure was enacted in 1912 establishing the control of a commission, consisting of a commissioner and his secretary, over all the public utilities subject to the legislative authority of the province (including telegraph and telephone lines, companies furnishing water, gas, heat, light, or power either directly or indirectly to the public), the provincial government telephones and the business carried on under the Manitoba Grain Elevators Act, and also such municipalities as shall properly consent to come within the authority of the commission. The latter has the powers of a court of record, can enforce its judgments, value the property of public-service corporations, regulate rates, control issues of stocks and bonds, and compel a uniform system of accounting. The judgments of the commission are final, except as to questions of jurisdiction, from which an appeal can be taken. Municipal franchises are subject to the commission's approval. The work of the commission was watched with much interest because of its importance as an economic and political experiment. The report for 1913 showed

the commission at work shaping the measures resulting in obtaining a Winnipeg water supply and procuring the consent of two cities, four towns, and certain rural municipalities, all of which were to share in the benefits. Other work done included investigations and reports upon publicly owned property and awards and decisions affecting disputes between municipalities and railway companies. Public approval of certain measures was secured by vote in various municipalities and, wherever necessary or expedient, popular opinion is sought in order to strengthen the efforts of the commission. Public confidence therein has thus far resulted from the judicial power and responsibility, subject to provincial legislation, with which the commission is invested, and which enable it to procure adequate evidence and the aid of experts.

Religion. The Roman Catholic church was first in the field, missions having been established among the Indians at a very early day. Among the more recent colonists, however, the Protestants have greatly preponderated, Roman Catholics in 1911 numbering 73,994, less than one-sixth of the total population. A Roman Catholic archbishop resides at St. Boniface, and the see house of the Anglican Bishop of Rupert's Land is at Winnipeg. Of the Protestants in 1911 the Presbyterians (103,621), Anglicans (Episcopalians) (86,578), Methodists (65,897), Baptists (13,992), Lutherans (32,730), and Mennonites (15,600) were the most important. There were 31,042 adherents of the Greek church in 1911.

Education. Originally the school system of Manitoba recognized a complete separation of Roman Catholics and Protestants, but in 1890 the schools were made undenominational; the Act making this provision was unsatisfactory to the Roman Catholics, and was amended in 1897 so as to admit of religious instruction when demanded by the parents of a certain number of pupils, but which would not be obligatory upon the other pupils, nor lead to the establishment of separate schools. According to the report of the Minister of Education for the year ended June 30, 1913, the school population numbered 99,750, of whom 83,679 were enrolled in the public schools and 48,163 were in average attendance. In the same year there were 2964 teachers and 2430 schools. Of the teachers 500 were male and 2464 were female. The value of school property was \$8,780,076. There were 13 high schools, 16 collegiate institutes, and a normal school. The provincial university elected its first president, Dr. James A. MacLean, in 1913, and in 1914-15 had made rapid progress towards establishing a teaching faculty and accomplishing an extensive building programme. Formerly the university was only an examining and degree-conferring body. Several theological and other colleges are affiliated with it.

History. *Sieur de la Verandrye* (q.v.), a French Canadian explorer, twice visited the territory now included in Manitoba, building Fort de la Reine, on the site of Portage la Prairie, in 1733, and five years later Fort Rouge, on the site of Winnipeg. The fall of Quebec in 1759 opened to British fur traders and merchants a vast tract previously held by the French and stimulated fur trading in the vast regions controlled by the Hudson's Bay Company. The Northwest Company, founded in Montreal in 1795, became a powerful rival of the latter. A

race of half-breeds, sprung chiefly from the marriages of French and Scotch employees of the two companies with Indian women, began to settle along the banks of the Red and Assiniboine rivers, acquiring squatters' rights, which they afterward resolutely defended. In 1811 the Earl of Selkirk, a member of the Hudson's Bay Company, attracted by the fertility of the soil on the banks of the Red River, obtained from the company a grant of a large tract of land on both banks of the river, extending some distance within the present frontier of the United States. The following year he brought out a number of settlers from the Highlands of Scotland. The right of the Hudson's Bay Company to grant this land was, however, disputed by the Northwest Company, and when the settlers began to build they were driven off by the servants of the Northwest Company. Hostilities continued between the servants of the two companies for several years, and in 1816 there was a pitched battle between them. The Earl of Selkirk, arriving soon after, found his settlers scattered; but by his energetic measures, and by help of 100 disbanded soldiers from Europe whom he had brought with him, he secured for his old and new protégés a peaceful settlement. They established themselves near Fort Garry (now Winnipeg), and in 1817 the Earl obtained from the Indians a transfer of their right to the land 2 miles back from the Red River on both sides. Still the settlers had some difficulties to overcome, especially from visitations of grasshoppers. These were gradually surmounted; but the population, including now a large number of half-breeds, remained very isolated, having little communication with the outside world. The Northwest Company was amalgamated in 1821 with the Hudson's Bay Company. Between 1841 and 1867 the acquisition and organization of the vast territories exploited by the fur companies had been much discussed by statesmen of the old Province of Canada, but no decisive action was taken until 1869, two years after Confederation.

In that year the Hudson's Bay Company surrendered all their claims to the Northwest Territories to the British government, which in the following year transferred that region to Canada. While the proposed transfer to the British crown of the Hudson's Bay Company was pending this portion of their dominions was the scene of considerable contention and violence. The French-speaking population, led by Louis Riel (q.v.), a half-breed, organized a force, imprisoned their English and Scotch opponents, seized Fort Garry, established a provisional government, robbed the strong box, and dictated terms to the governor of the Hudson's Bay Company, to which he had to submit. A military force under Colonel Garnet (later Field Marshal Viscount) Wolseley arrived in the province in July, 1870, and Riel, fearing capture, fled, upon which the insurrection collapsed. In 1870 that portion of the Red River district between long. 96° and 99° W. and lat. 49° and 50° 30' N. was organized as the Province of Manitoba, and its admission to the Confederation took place in July of the same year. Discontent among the Indians was allayed by several treaties (1871-77) under which reservations were allotted to them, with the option of living therein after the manner of the white population or of retaining their native customs. Canadian and American commissioners worked

together to define the international boundary between the United States and Manitoba (1872). In 1873 the Royal Northwest Mounted Police was organized (see MILITARY POLICE), and two years later amnesty was granted to those who took part in the rebellion of 1869, excepting Riel and two of his confederates. Although the rights of the Indians were thus early safeguarded, the half-breeds were neglected, with the result that in 1885 there was another rebellion (see SASKATCHEWAN), likewise headed by Riel. The rebellion was suppressed the same year and Riel was captured and hanged. Manitoba became involved in the boundary dispute between the Dominion and Ontario. Sir John A. Macdonald, unfavorable to Ontario's assertion of provincial rights, procured in 1881 the passage of a bill extending the boundaries of Manitoba towards the west, which would have taken from Ontario part of the territory awarded to that province in 1878. Ontario vigorously opposed this threatened loss, proceeded in 1883 to assume full ownership and control of the disputed area, and was thus brought into political conflict with Manitoba. Besides the effort to enlarge her boundaries, Manitoba also contended for larger grants from the Dominion Treasury and freedom from the monopolistic construction privileges of the Canadian Pacific Railway. These privileges were abolished in 1888. The boundary claims of the province were rejected by a decision of the Judicial Committee of the Privy Council in 1884, but the dispute continued until 1912, when it was finally settled by the addition of 178,100 square miles to the old provincial area. The Dominion subsidies to Canada were also increased. In 1890 the question of parochial or separate schools went far to make Manitoba the storm centre of federal as well as provincial politics. In 1871 the province had established a system of separate schools under which Roman Catholic pupils were controlled by the Roman Catholic section of a general school board. Thomas Greenway (q.v.), the provincial Premier, procured the enactment of laws abolishing separate schools and the official use of the French language in the province. This was strongly resented by the Roman Catholic and French-speaking population, and a struggle ensued for the repeal of the obnoxious legislation. The French of Quebec and Roman Catholics throughout the Dominion sympathized with the minority in Manitoba. The case was taken eventually to the highest court of colonial appeal, the Judicial Committee of the Privy Council, whose decision referred to the Dominion government the duty and task of enforcing a remedial measure against Manitoba, according to the provisions of the British North America Act. The question thus became a federal issue and excited prolonged and bitter controversy. The Conservatives favored the forcing of Manitoba to change the new school law; the Liberals advocated a milder course. Upon the advent of Wilfrid Laurier to the Dominion premiership in 1896, his administration, together with the Manitoba administration of Thomas Greenway, arranged a compromise whereby, without the full restoration of separate schools, religious instruction was to be given after regular school hours to the children of either Protestant or Roman Catholic parents. This arrangement was agreeable to the party of provincial rights, but it did not placate the Roman Catholic population.

After 1896 a large increase in immigration and agricultural production gave rise to new economic and political problems. The Liberal and Conservative parties respectively in the province were in large part affiliated with the corresponding parties in Dominion politics; but both showed a greater readiness to increase government initiative in the ownership and supervision of public services, though the leading part therein was taken by the Conservatives. Prohibition of the liquor traffic became a party question, the Liberals generally advocating abolition of the bar and the Conservatives local option. In 1905 the Conservative administration of Sir R. P. Roblin (q.v.), who had become Premier in 1900, passed a high-license bill; but the movement for abolition of the bar was vigorously continued. Premier Roblin sought to conciliate the Prohibitionists by a measure for the earlier closing of saloons (1914). Reorganization of the Court of King's Bench, the creation of a Court of Appeal, and the compulsory display of the British flag on public schoolhouses had been effected by 1907. Railway extension to districts with few or no transportation facilities was also aided liberally, and in 1908 an important step in the ownership and regulation of public utilities was taken in the government's purchase and operation of the Bell telephone system. A workmen's compensation act was passed in 1910. An elaborate system of elevators for the storage of grain and the facilitation of shipments thereof under the Canada Grain Act (1912) had been organized in Ontario, the Northwest Provinces, and British Columbia; and Manitoba participated importantly therein on account of Winnipeg being one of the centres for grain inspection, the others being the great terminal elevators at Port Arthur and Fort William, Ontario. Consolidation and regulation of public utilities became the subject of notable legislation in 1912. See section on *Public Utilities Commission*.

The question of religious education in 1912-14 became more urgent on account of the increasing variety of immigration. The linguistic provisions of the school compromise of 1897, and the giving of religious instruction after school hours, became more difficult because of the demands of German, Scandinavian, and Slav elements of the population. The law implied that teachers of children speaking other than English must qualify to teach them in their mother tongue as well as in English. The Liberals favored compulsory education and the strict enforcing of the teaching of English; the Conservative government, a liberal construction of the law. It was recognized that the question contained elements of future disturbance. The War in Europe (q.v.) aroused demonstrations of loyalty throughout the province; nevertheless, in certain German newspapers contrary sentiments and opinions were expressed until prohibited by the government. The Royal Northwest Mounted Police, part of which force is employed in the more unsettled parts of Manitoba, was increased by 500 men in order to deal more effectively with disturbing conditions due to the war.

The lieutenant governors of Manitoba since its incorporation into the Dominion in 1870 are: A. G. Archibald, 1870-72; Francis G. Johnston, 1872; Alexander Morris, 1872-76; Joseph E. Cauchon, 1876-82; J. C. Aikins, 1882-88; Sir John Schultz, 1888-95; J. C. Patterson, 1895-

1900; Sir D. H. McMillan, 1900-11; Sir D. C. Cameron, 1911-

The different premiers of provincial administrations since 1870 are: Alfred Boyd, 1870-71; Marc A. Girard, 1871-72; H. J. H. Clarke, 1872-74; Marc A. Girard, 1874; R. A. Davis, 1874-78; D. H. Harrison, 1878-88; Thomas Greenway, 1888-1900; Hugh J. (afterward Sir) Macdonald, 1900; R. P. (afterward Sir) Roblin, 1900-

During the earlier years of provincial administration party lines were not very strictly drawn; but with the Liberal administration of Thomas Greenway and the Conservative administrations of H. J. Macdonald and R. P. Roblin Manitoba had developed a regular party system.

MANITOBA, LAKE. A body of water in the Province of Manitoba, Canada, intersected by the fifty-first parallel and the ninety-ninth meridian (Map: Manitoba, E 3). It is about 60 miles southwest of Lake Winnipeg, which receives its waters through the Saskatchewan, or Dauphin, River, which, near the middle of its course, expands into St. Martin's Lake. Manitoba Lake is about 125 miles long and about 25 miles wide; area, about 1900 square miles. It is 40 feet higher than Lake Winnipeg, and navigable for vessels drawing 10 feet of water. It abounds in fish, and its shores are resorted to by sportsmen for moose, elk, deer, and wild fowl. At its north end it receives the waters of several smaller lakes, and at the south those of the White Mud River. The scattered settlements around are inhabited chiefly by Norwegians and Icelanders.

MANITOU, mán'ti-tōō. A town in El Paso Co., Colo., 6 miles northwest of Colorado Springs, on the Colorado Midland and the Denver and Rio Grande railroads (Map: Colorado, E 3). The centre of a region renowned for picturesque scenery, Manitou is situated about 6300 feet above the sea, at the junction of and in three cañons—Ute Pass, William's Cañon, and Engleman's Cañon—at the foot of Pikes Peak (q.v.). A number of important mineral springs, which are valued for their medicinal properties, and the many natural attractions of the vicinity, combine in making Manitou one of the most popular health and pleasure resorts in the United States. The varied features of interest are the Pikes Peak Cog Railway, which begins here, the

Cave of the Winds, cañons, falls, drives, Soda Spring Park, and the famous Garden of the Gods (q.v.), which contains picturesque formations of red and white sandstone. The town contains a Carnegie library and a tuberculosis sanitarium. Spring water is bottled and shipped in large quantities. The population in summer is estimated at between 10,000 and 15,000. Pop., 1900, 1303; 1910, 1357.

MANITOU, or **MANITO** (Algonquian Indian, mystery, supernatural). An Algonquin word now used in current writing to designate a special religious concept common to the Algonquin-speaking Indian tribes of the Great Lake region. These Indians believe in the existence of a cosmic mysterious property pervading the universe and manifest everywhere. In their sacred mythology this element is personified in various manlike gods spoken of as the manitous, but the Algonquin never ceases to feel that the real manitou property may and does reside in any and all things. It is fairly evident that there is not and never was in primitive Indian beliefs any conception corresponding to the modern civilized idea of God or Deity. The manitou might be a supernatural being of any grade however low, and, further, anything mysterious or beyond comprehension was manitou. Another term of Chinook origin, viz., *tamanuus*, is now widely used in the Northwest of North America to express much the same conception, and the cult of the *tamanuus* as a protecting spirit of an individual has thrown much light on shamanistic customs and beliefs. A similar conception is termed *wakanda* by the Sioux and *orenda* by the Iroquois. In Melanesia there is the strikingly similar notion of "mana." Mana is believed to effect anything outside the ordinary course of nature; thus, a strangely shaped stone is interpreted as containing mana, and any conspicuous success achieved by a person is ascribed to his possession of mana. The occurrence of this conception in two quite distinct culture areas has led a number of writers to ascribe to it an important place in the development of religious beliefs. It has been assumed by some that the Algonquian manitou is an essence or force, but Radin's most recent data indicate that this is an abstraction created by the investigators: "If a belief in a manito 'essence' or 'force' exists, it is as a characteristic of a manito" (being). This again strengthens the resemblance with mana, for, while impersonal, mana is always connected with some directing personal agency (Codrington). Consult: R. H. Codrington, *The Melanesians* (Oxford, 1891); Jones, "The Algonkin Manitou," in *Journal of American Folk-Lore* (Boston, 1905); F. W. Hodge (ed.), *Handbook of American Indians North of Mexico* (Washington, 1907-10); Saintyves, *La force magique* (Paris, 1914); Paul Radin, "An Introductory Enquiry into the Study of Ojibwa Religion," in *Ontario Historical Society, Papers and Records*, vol. xii (Toronto, 1914). See INDIANS, AMERICAN; TOTEMISM.

MANITOULIN (mān'tī-tōō'lin) ISLANDS.

A group situated in Lake Huron, from whose north shore it is separated by North Channel, varying from 7 to 18 miles in breadth (Map: Ontario, B 2). It comprises Great Manitoulin, or Sacred Isle; Little Manitoulin, or Cockburn Isle, belonging to Great Britain; and Drummond Isle, belonging to the State of Michigan. Great Manitoulin is 90 miles long by 5 to 30 broad; Little Manitoulin is circular in shape and has

a diameter of 7 miles; Drummond Isle is 24 miles long by from 2 to 12 broad. All are irregular and striking in their natural features; the first two are covered with large and dense forests of pine. The islands afford good fishing and the various villages on them are favorite summer resorts. Half of the resident population are Ojibwa Indians. Pop., 2000.

MANITOWOC, mān'tō-wōk'. A city and the county seat of Manitowoc Co., Wis., 75 miles north of Milwaukee, on Lake Michigan, at the mouth of the Manitowoc River, and on the Chicago and Northwestern, the Ann Arbor, the Minneapolis, St. Paul, and Sault Ste. Marie, and the Pere Marquette railroads (Map: Wisconsin, F 4). It has a fine harbor with good docking facilities and considerable lake commerce, the shipments being principally grain, flour, cheese, coal, etc. The city is chiefly interested in the building of ships; other industrial establishments include aluminium-ware factories, cigar factories, extensive malt houses, grain elevators, coal docks, planing mills, brick yards, furniture and canning factories, machine shops, and edge-tool and agricultural-implement works. The County Insane Asylum, the Holy Family Hospital, and a Polish orphan asylum are situated here. Other noteworthy features are the Training School for Teachers, public library, and three beautiful parks. Manitowoc was chartered as a city in 1870. The water works and electric-light plant are owned by the city. Pop., 1900, 11,786; 1910, 13,027; 1914, 13,553; 1920, 17,563.

MANIZALES, mā'nē-sā'lās. A town of Colombia, the capital of the Department of Caldas. It is situated 100 miles northwest of Bogotá, and at the junction of the main routes over the Central Cordillera, 6400 feet above sea level (Map: Colombia, B 2). It was founded in 1848 and has had a very rapid growth. The town is a thriving commercial centre and is of great strategic importance. It has gold-mining and stock-breeding industries, a bank, and a public library. Pop., 1905, 24,676; 1912, 34,720. The town was the headquarters of the rebels during the civil war of 1877-78.

MANKATO, mān-kā'tō. A city and the county seat of Blue Earth Co., Minn., 86 miles southwest of St. Paul, at the confluence of the Minnesota and Blue Earth rivers and on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Chicago Great Western railroads (Map: Minnesota, D 6). It has a State normal school, a fine Federal building, Carnegie library, a ladies' seminary (Lutheran), a Catholic mother house, two commercial colleges, and Immanuel and St. Joseph's hospitals. Other places of interest are the spot where 38 Indians, convicted of murder, were hanged during the Sioux Indian outbreak in 1862; Minneopa State Park, which has picturesque falls; and Rapidan Dam. The city is in an agricultural region and has extensive quarries of stone. Excellent water power is afforded the industrial establishments, which include flour and knitting mills, foundries and machine shops, lime, brick, and cement works, wood-working plants, and manufactories of shirts, overalls, traction engines, cigars, candies, incubators, steam engines, tents, awnings, brooms, etc. Mankato adopted the commission form of government in 1910. The water works are owned by the city. Pop., 1900, 10,599; 1910, 10,365; 1920, 12,469.

MANLEY, or **MANLY**, JOHN (1733-93).

An American naval officer, born at Torquay in England. He removed to Marblehead, Mass., and at the outbreak of the Revolution joined the naval forces of the Colonies. Washington appointed him commander of the Massachusetts State cruiser *Lee*, in which capacity he rendered efficient service during the siege of Boston by intercepting British supplies. In 1776 he received from Congress a commission as captain of the new cruiser *Hancock*, and soon after putting to sea captured the British man-of-war *Fox*. The following year, while cruising in company with the *Boston*, he fell in with the two British men-of-war *Rainbow* and *Victor*, and, being deserted by his consort, was captured. In 1782 he was put in command of two privateers and the government frigate *Hague*, in which he was attacked by a superior British force, but managed to make his escape.

MANLEY, MARY DE LA RIVIÈRE (c.1663-1724). An English author, daughter of Sir Roger Manley, Governor of the Channel Islands, born in Jersey, or at sea between Jersey and Guernsey. Having been beguiled (about 1688) into a mock marriage with her cousin, John Manley of Truro, she lived for a time with the Duchess of Cleveland. Besides plays and short novels, she wrote many numbers of the *Examiner*, after Swift abandoned it. For some years she was the mistress of Alderman Barber. She died at Barber's printing house on Lambeth Hill, July 11, 1724. Mrs. Manley employed her talents mainly in depicting the scandalous life of the times. *Letters Written by Mrs. Manley* (1696) and the *Secret History of Queen Zarah and the Zarazians* (1705) were followed by the *New Atlantis*, of which two volumes appeared in 1709. With this famous work were afterward incorporated *Memoirs of Europe* (1710) and a further continuation. Among several plays which she wrote may be mentioned *Lucius*, played at Drury Lane (1717). In 1720 appeared a series of short tales called *The Power of Love, in Seven Novels*. Incidents in her own career Mrs. Manley related in the *Adventures of Rivella* (1714).

MANLIUS. A Roman gens, chiefly patrician, some of whose members played an important part in the history of the Republic. 1. **MARCUS MANLIUS CAPITOLINUS**, who was consul in 392 B.C. and two years later gained his surname by rescuing the Capitol from the attacks of the Gauls, after he was roused by the cackling of the sacred geese. Later, tradition says, he favored the lower classes, and, in consequence, in 381 was arraigned before the Comitia Centuriata on a charge of aspiring to be king, and sentenced to be thrown from the Tarpeian Rock. The name of Marcus was never after borne by any of the Manlian gens, who considered him a traitor to his family and class. 2. **LUCIUS MANLIUS IMPERIOSUS**, dictator 363 B.C. 3. **TITUS MANLIUS IMPERIOSUS TORQUATUS**, son of Lucius, military tribune, twice dictator (353, 349 B.C.), and three times consul. His surname was derived from his having despoiled a gigantic Gaul of a golden chain (*torques*) after having slain him in single combat. In his last consulship he waged a successful war against the Latins and Campanians, defeating them in two battles near Vesuvius; in one his colleague, P. Decius Mus, devoted himself. Manlius, too, caused to be put to death his own son, who had disobeyed his orders by engaging in single combat with the enemy. 4. **TITUS MANLIUS TORQUATUS**

was consul in 235 and in 224 B.C., censor in 231, dictator in 208. In 235 he subdued Sardinia, which had been ceded to Rome by Carthage at the close of the First Punic War. In 224 he defeated the Gauls and crossed the Po. In 216 he was victorious over the Carthaginians when they tried to regain Sardinia. 5. **GNEIUS MANLIUS VULSO**, consul 189 B.C. He was victorious over the Galatians in Asia Minor.

MANLY, JOHN. See **MANLEY, JOHN.**

MANLY, JOHN MATTHEWS (1865-). An American scholar, born in Sumpter Co., Ala., and educated at Furman University and at Harvard, where he took the degree of Ph.D. in 1890. During the preceding six years he had been a teacher as well as a student; and after leaving Harvard he was successively associate professor and professor of English at Brown University (1891-98), and professor of and head of the department of English in the University of Chicago. In 1909 he was the Chicago exchange professor at the University of Göttingen. A contributor to the *Cambridge History of English Literature* and the *Encyclopædia Britannica*, he was also the editor of *Specimens of the Pre-Shakespearean Drama* (1897); *English Poetry* (1907); *English Prose* (1909). He also served as managing editor of *Modern Philology*.

MAN MILLINER, THE. A nickname given to Henry III of France on account of his effeminacy and fondness for dress.

MANN, SIR DONALD D. (1853-). A Canadian railway promoter. He was born at Acton, Ontario, and was educated at the public schools and privately. He studied for the ministry of the Presbyterian church, but later relinquished that aim and engaged in business as a railway contractor. He became associated with Sir William Mackenzie (q.v.) in the building of the Canadian Northern Railway, acquired a large fortune, and was made first vice president of that railway and president of, or director in, several industrial and financial corporations. He was appointed honorary lieutenant colonel of the Twentieth Regiment (1908) and was knighted in 1911.

MANN, HORACE (1796-1859). An American educational reformer and philanthropist, born at Franklin, Mass., May 4, 1796. He was graduated at Brown University, 1819. Studying law, he was admitted to the bar in 1823; in 1827 he was elected to the State Legislature of Massachusetts and six years later to the State Senate, over which he was chosen to preside in 1836. From the beginning of his legislative career he became a leader in philanthropic and reform movements of various kinds. In 1837 the State Legislature, largely on the advice of Mr. Mann, appointed a board of education to revise the school laws and to reorganize the common-school system of the State. Of this board Mr. Mann was made secretary, and for 12 years he devoted to this cause all his time, often against the most bitter opposition. This was the great work of his life, for the movement begun under his leadership was not confined to Massachusetts, but affected the entire United States and led to the development of the free public-school system as it exists to-day. These reforms were instituted through various instrumentalities, chief among which were his annual *Reports* as secretary. The 12 volumes of these *Reports* (1837-48) have become educational classics, and were reprinted in Europe as well

as circulated throughout the United States. In addition to these he also founded and edited the *Common School Journal*, through which he advocated his reform ideas. Finally, through a very great number of teachers' institutes and meetings, to which he gave indefatigable attention, he inspired the teaching body to greater efforts and with higher ideals.

In the course of his reform efforts he visited the schools of continental European countries and introduced, against a storm of opposition, many of the advanced ideas of school work, especially those growing out of the Pestalozzian movement (q.v.). The immediate work of Mann, however, which was of the greatest importance, was the reorganization of the common-school system of Massachusetts. Since the dominance of the democratic sentiment during the latter half of the eighteenth century the unit of school organization had been the district instead of the town. In place of the district, Mann sought to restore the more centralized control of the town, which would give a broader public support, a greater freedom from factional quarrels, a better financial basis, a better prepared and better remunerated staff of teachers, and better equipment. Though the reform was not accomplished until after Mann's withdrawal from the secretaryship, and in fact not finally settled until after a bitter conflict lasting a quarter of a century, yet his efforts developed the public sentiment that finally established the more centralized control of education and gave to this organization when established a far better support than education had ever received. But one service to education rendered by Horace Mann is to be rated above even all these. It was owing to his efforts that the first normal school (q.v.) in the United States for the training of teachers was established. This first school was opened in 1839 at Lexington, Mass. In 1848 Mann was elected to Congress to fill the vacancy caused by the death of John Quincy Adams. There for two terms he continued the work begun by Adams in opposition to slavery. From 1852 to 1859 Mann was president of Antioch College, Yellow Springs, Ohio, where he again led in an advanced educational movement—that of the coeducation of the sexes.

Horace Mann was not a professional educator, however, but a publicist and statesman. His greatest work was the rather indefinite one of arousing public opinion to the importance of education and the directing of legislative effort to the improvement of educational conditions. He became the leader, or at least the forerunner, of the great educational movement which has reached from the middle of the nineteenth century to the present time.

In addition to his *Reports*, his published works include: *Lectures on Education* (1840); *Lectures on Education* (1845); *On the Study of Physiology in Schools* (1850); *Slavery, Letters and Speeches* (1850); and numerous lectures and addresses.

MANN, JAMES ROBERT (1856-). An American Congressman and lawyer, born near Bloomington, Ill. In 1876 he graduated from the University of Illinois and in 1881 from the Union College of Law at Chicago, where he thereafter practiced his profession with success. He was attorney of Hyde Park in 1888, alderman of the 32d Ward of Chicago in 1893-96, master in chancery of the Superior Court of Cook County in 1892-96, and attorney of the South Park Board in 1895. Participating in politics as a regular Republican, he was temporary chairman of the State Convention of that party in 1894 and chairman of the Cook County conventions in 1895 and 1902. He served as a member of the 55th to the 63d Congresses (1897-1915), and in 1911 was chosen floor leader of the Republican minority in the House. For one congressional term he was assisted by ex-Speaker Cannon. Mann's ability as a parliamentarian was highly praised by President Taft. In debate he led his party skillfully in its opposition to the tariff, currency, and canal tolls policies of the Democrats. He became known for his comprehensive grasp of and attention to the details of legislation and for his constant attendance at the sessions of Congress.

MANN, MATTHEW DERBYSHIRE (1845-1921). An American obstetrician, born at Utica, N. Y. He graduated at Yale in 1867 and at the College of Physicians and Surgeons, New York, in 1871. After two years' study in Heidelberg, Paris, Vienna, and London he practiced in New York until 1879, then in Hartford until 1882, and thereafter until 1910 was professor of gynecology in the University of Buffalo. He became gynecologist at the Buffalo General Hospital, and in 1894 was president of the American Gynecological Society. He was one of the physicians who attended President McKinley after he had been shot by the anarchist Czolgosz. He wrote *Immediate Treatment of Rupture of the Perineum* (1874) and *Manual of Prescription Writing* (1878; 6th ed., rev., 1907); and edited an *American System of Gynecology* (2 vols., 1887-88).

MANN, TOM (1856-). An English labor leader. He was born at Foleshill, Warwickshire, and worked on a farm for two years before he was 11 and then for three years in the mines. He became an engineer in Birmingham and (1877) in London, where in 1881 he joined the engineers' union (Amalgamated Society of Engineers) and began his career as a trade-unionist. In 1885 he became a Socialist. He was the first secretary of the London Reform Union (founded 1892) and of the National Democratic League, and was one of the first English labor leaders to ally himself with syndicalism. In 1912 he was arrested for a speech urging soldiers to refuse to shoot at strikers. He was found guilty and sentenced to six months' imprisonment, but served only about six weeks.

MANN, WILLIAM JULIUS (1819-92). An

American Lutheran theologian and author, born in Stuttgart, Germany. He studied there and at Tübingen and was ordained in 1841. Three years later he came to the United States with Dr. Philip Schaff and settled in Philadelphia. There he was assistant pastor (1850-63) and pastor (1863-84) of St. Michael's and Zion's Church. From its establishment in 1864 almost to his death he was professor of symbolics at the Lutheran Theological Seminary. With Dr. Schaff he edited *Der deutsche Kirchenfreund*. His own works include: *Plea for the Augsburg Confession* (1856); *Lutheranism in America* (1857); *Life and Times of Henry Melchior Muhlenberg* (1887). Consult his *Life* by his daughter, Emma T. Mann (Philadelphia, 1893).

MAN'NA (Heb. *mān*, Ar. *mann*, Gk. *μάρνα*, *manna*; perhaps connected with the Egyptian *mennu*). According to the biblical account, the chief food of the Israelites during their 40 years' wandering in the desert (Ex. xvi; Num. xi. 6-9). It is described as falling from heaven like rain or with the dew; small, round and white, like coriander seed; in taste, sweet like honey, or like fresh oil. It was gathered in the morning and it melted when the sun arose. A sufficient amount was provided daily for each individual and no more; if a surplus was gathered it spoiled before the succeeding morning. On the sixth day, however, a double portion was provided, and none could be found on the Sabbath. It could be ground in a mill, beaten in a mortar, baked and made into cakes, or boiled. A command was given to preserve an omer of it in the ark of the covenant for future generations. (Cf. Heb. ix. 4.) The supply ceased on entrance into the promised land. (Josh. v. 12.) In Ex. xvi. 15 the name is explained by a reference to the exclamation of the Hebrews when they first saw the manna and knew not as yet what it was, *mān* being made equivalent to *mah*, "what is it?" This explanation is probably a species of popular etymology and indicates that the true origin of the word was unknown. In the later literature manna is called "corn" or "bread of heaven" and "angels' food." (Ps. lxxviii. 24-25, cv. 40; cf. John vi. 31; 1 Cor. x. 3.) Attempts have been made to explain the biblical manna as the exudation from the tarfa tree, a species of tamarisk (*Tamarix gallica mannifera*), or the camel's thorn, or as lichens. Manifestly such an explanation fails to satisfy all the conditions of the narrative. If it be believed, however, that the latter represents an early tradition with later embellishments, the view becomes plausible that the use of some such food by a small tribe or clan in time of need may have formed the basis of the narrative. The passage in Numbers is attributed to the Yahwistic writer, and hence is preëxilic; that in Exodus is found in the priestly narrative, but it probably embodies certain old fragments with considerable additions by the redactors. Consult the commentaries of Dillmann, Baentsch, and Strack on Exodus xvi. See COCCINÆ.

MAN'NA. A sweet substance that exudes from incisions in the stems of *Fraxinus ornus* and other species of ash. The principal supply of manna comes from Sicily, where during July and August incisions are made in the trunks and larger limbs of the trees, and if the weather be warm the manna begins to ooze from the cuts and hardens into lumps or flakes which are removed by collectors. Manna is a light, porous substance of a yellowish color, not unlike dried

honey. There are different qualities found upon the market, which vary in their purity and composition. Flake manna is obtained when there is an abundant flow from the upper incisions. It dries into flat pieces or tubes and differs somewhat in composition from the other varieties. Small, or talfa, manna occurs in tears from the lower incisions and is less crystalline and more gummy. Fat manna is brownish, viscid, non-crystalline, and is usually full of fragments of bark and other impurities. Manna is largely used in medicine as a laxative, demulcent, and expectorant, and is commonly administered with other medicines, as senna, rhubarb, etc. Its constituents, as reported by many investigators, are mannite 60 to 90 per cent, glucose, mucilage, fraxin, resin, etc. In addition to its value in medicine, manna has been extensively used for food, its value for this purpose depending upon the carbohydrates present.

In addition to that produced by various species of ash, manna or substances resembling it are excreted by many other species of plants. In Australia various species of Eucalyptus produce what is called manna or lerp. This saccharine substance is said to be without the laxative properties of true manna and is eaten as food. Similar substances are obtained in Australia from the tea tree (*Leptospermum scoparium*), sandalwood (*Myoporum platycarpum*), and Australian blue grass (*Andropogon annulatus*). During a famine in India a manna-like substance was exuded in sufficient abundance from a species of bamboo (*Dendrocalamus strictus*) to form an important food supply in some districts. It did not contain any mannite, the principal characteristic of true manna. Similar substances are obtained from the common larch of Europe (*Larix decidua*), the substance being known as Briançon manna; from *Quercus vallonea*, called Armenian manna; Persian manna from *Alhagi camelorum*, camel's thorn; tamarisk manna from *Tamarix gallica mannifera*, believed by some to have been the source of the manna of the Israelites, while others attribute it to a lichen, *Lecanora esculenta*; American manna, from the sugar pine (*Pinus lambertiana*); Californian manna, believed to be deposited from *Phragmites communis*; etc. Some insects, as *Lavinia mellificus*, secrete a similar material. All of these saccharine substances are usually grouped together as false manna. They contain as their principal constituent melitose or melezitose, but no mannite. A large number of plants yield small quantities of mannite. For a discussion of their chemical composition, consult Tollens, *Handbuch der Kohlenhydrate* (Breslau, 1895).

MAN'NA GRASS, FLOATING FESCUE, FLOATING SWEET MEADOW GRASS, ETC. (*Glyceria fluitans*). A perennial grass, 1 to 3 feet tall, found in marshes, ditches, and by the sides of stagnant pools in Europe, Asia, North America, and Australia. The stems are decumbent at the base and rooting at the joints; the leaves long and rather broad, the lower ones often floating; the inflorescence, a long, slender, nearly erect panicle. In irrigated meadows and in very wet grounds manna grass affords large quantities of cattle food. In many parts of Germany and Poland the seeds, which fall very readily out of the spikelets, are collected by spreading a cloth under the panicles and shaking them with a stick; they are used in soups and gruels, are very palatable and nutritious, and are known as Polish manna. There are a number of other

species of *Glyceria*, nearly all of which frequent moist soils. By some botanists they are all referred to the genus *Panicularia*.

MANNA INSECT. A scale insect (*Gossyparia mannifera*) which lives on tamarisk in many places in countries bordering upon the Mediterranean Sea and produces manna, which is a substance very like honey. It is surely a product of the insect and not a secretion of the plant, although formerly it was supposed to exude from the plant through punctures made by the insect. The insect is found in Algeria, Arabia, Armenia, and southern Russia. Formerly it was known as *Coccus manniferus*, or *Chermes mannifer*, the latter, the earliest name, having been proposed by Hardwick in 1822. See COCCIDÆ.

MAN'NERING, MARY (1876-). An American actress, born in London. She studied for the stage under Hermann Vezin and made her début as an actress at Manchester under her own name of Florence Friend in 1892. She appeared on the London stage in the same year and in 1896 was induced by Daniel Frohman to come to New York, where she began playing as "Mary Mannering" (the maiden name of her father's mother). She first starred at Buffalo, N. Y., in 1900, in the title rôle of *Janice Meredith*. Thereafter she played leading parts in *White Roses* (New York, 1901); *The Truants* (Washington, 1909); *The Independent Miss Gower* (Chicago, 1909); *A Man's World* and *The Garden of Allah* (New York, 1910). She was married to James K. Hackett (q.v.) and later to Frederick E. Wadsworth.

MAN'NERISTS. A term applied to painters and sculptors who make an exaggerated or unmeaning use of inherited or acquired forms, without independent study of nature and without understanding their significance. A work of art is mannered when the forms are inappropriate to the ideas expressed. The term Mannerists is most frequently applied to those Italian painters who were pupils of or immediately followed the leaders of the High Renaissance—especially Michelangelo, Raphael, Correggio—whose styles they imitated and exaggerated. See PAINTING.

MAN'NERS, CHARLES (1857-). An English basso and operatic impresario, born in London, his real name being Southcote Mansergh. Having studied in Dublin, London, and Italy, he began his career as a chorus singer in 1881. In the following year he made his début at the Savoy Theatre in Gilbert and Sullivan's *Iolanthe*. After a successful tour of the provinces he appeared at Covent Garden in 1890. On his return from a tour of South Africa he established the Moody-Manners Opera Company. His attempt to give opera in English met with such success in the provinces that in 1902 he gave a season in London, with the result that his season has become a fixture in the capital. Beginning with smaller works, the company gradually undertook works of a more exacting nature, until the repertory now includes all the great Wagner dramas, which thus were heard for the first time in the provinces. In 1890 he married Fanny Moody (born 1866), an excellent singer, who became the leading artist in his operatic company.

MANNERS, J. HARTLEY (?-). An American playwright, who was early an actor. His *Peg o' my Heart*, a comedy, played in New York from Dec. 20, 1912, to May 30, 1914, his wife, Laurette Taylor (q.v.), taking the leading rôle.

It afterward had a long run in London. Manners's other plays include: *The Crossways*; *As Once in May*; *The Queen's Messenger*; *Zira*, with Henry Miller; *The Majesty of Birth*; *Ganton & Co.*; *The Girl and the Wizard*; *The Prince of Bohemia*; *The Girl in Waiting*; *A Woman Intervenes*. He published *Peg o' my Heart* in 1913, and *Happiness and Other Plays*, including *Just as Well* and *The Day of Dupes*, in 1914.

MANNERS, JOHN. A British general. See GRANBY, JOHN MANNERS, MARQUIS OF.

MANNERS, JOHN JAMES ROBERT, DUKE OF RUTLAND (1818-1906). An English statesman, born at Belvoir Castle, Leicestershire, Dec. 13, 1818. He was educated at Eton and at Trinity College, Cambridge. In 1841 he began his long parliamentary career in the Conservative interest, was twice Postmaster-General (1874-80 and 1885-86), and succeeded Earl Stanhope as chairman of the Copyright Commission. On the death of his brother (1887) he became seventh Duke of Rutland. Under Disraeli's influence he joined the Young England party, and with the former he toured the industrial districts of Lancashire, impelled by his zeal for industrial reform. In Disraeli's *Coningsby* (1844), *Sybil* (1845), and *Endymion* (1860) he figures more or less prominently. Among his publications are: *England's Trust and Other Poems*; *English Ballads and Other Poems* (1850); and notes of his Irish and Scottish tours of 1848-49. Consult Reginald Lucas, in *Dictionary of National Biography*, Second Supplement, vol. ii (London, 1912).

MANNERT, män'närt, KONRAD (1756-1834). A German historian and geographer, born at Altdorf and educated at Nuremberg. In 1796 he became professor of history at Altdorf, in 1805 at Würzburg, in 1807 at Landshut, and in 1826 at Munich. His geographical works include the valuable *Geographie der Griechen und Römer* (10 vols., 1795-1825), with Ukert, and an edition of the *Tabula Peutingeriana* (1824); and among his historical labors the more important are: *Kompendium der deutschen Reichsgeschichte* (1803; 3d ed., 1819); *Kaiser Ludwig IV.* (1812); *Geschichte der alten Deutschen, besonders der Franken* (1829-32). Consult *Allgemeine deutsche Biographie*, vol. xx (Leipzig, 1884).

MAN'NES, DAVID (1866-). An American violinist, born in New York City. At the age of 10 he took up the violin, without a teacher, and made considerable progress. After systematic study under H. Brode and C. Ritcher, he earned his living by playing in theatre orchestras. During the summers he went abroad and studied at different times with De Ahna, Halir, and Ysaye. In 1891 he was discovered by Walter Damrosch, who engaged him as one of the first violins for the New York Symphony Orchestra. From 1899 to 1911 he was concert master of this organization. The Sonata Recitals which he began in 1905 with his wife (Clara Damrosch) soon were recognized as events of importance. He always took deep interest in the affairs of the Music School Settlement, of which he became director in 1910. In 1912 he founded the Music School Settlement for Colored People.

MANNFELD, män'fêlt, BERNARD (1848-). A German etcher. He was born in Dresden and as a boy studied painting under Otto Georgi, but later acquired a knowledge of architecture, which led him to take up etching. He

designed for the Seiler Institute for Glass Painting (Breslau) from 1866 till 1873, when he removed to Berlin. Three years later he published his first cycle of original etchings, entitled "Durchs deutsche Land," containing 60 plates of views of cities, buildings, and picturesque spots in Germany and Austria. He continued to make a specialty of architectural subjects and romantic landscapes, constantly improving his technique by studying the work of foreign etchers, particularly that of Axel Haig. He was employed by the state to etch some of the monuments in the National Gallery, Berlin, and in 1896 was called to the Stadel Institute, Frankfurt (professor in 1900). Among his finest plates are "The Castle of Heidelberg"; "The Rheingrafenstein in Nahetal"; "The Albrechtsburg in Meissen"; "The Cathedral at Aix-la-Chapelle"; "View of Dresden"; "Old Bridge, Frankfurt"; "Interior of Frankfurt Cathedral."

MANNHARDT, män'härt, WILHELM (1831-80). A German mythologist, born at Friedrichstadt in Schleswig. He was educated in the universities of Berlin and Tübingen and became editor of the *Zeitschrift für deutsche Mythologie und Sittenkunde* (1855). His books on Germanic myth include: *Germanische Mythen* (1858); *Die Götter der deutschen und nordischen Völker* (1860); *Roggenwolf und Roggenhund* (2d ed., 1866); *Die Korndämonen* (1868); *Klytia* (1875); and his great works, *Wald- und Feldkulte* (1875-77; 2d ed., by Heuschkel, 1904-05) and *Mythologische Forschungen* (ed. by Patzig, 1884). Consult *Allgemeine deutsche Biographie*, vol. xx (Leipzig, 1884).

MANNHEIM, män'him. The largest city of the Grand Duchy of Baden, at the confluence of the Rhine and Neckar, 43 miles southwest of Frankfurt (Map: Germany, C 4). It is the third largest city on the Rhine, surpassed only by Cologne and Düsseldorf; since its connection by railroad with all important cities in the German Empire it has become the first commercial town in the Grand Duchy of Baden. The site of the town is low, and a high dike protects it from floods. The Rhine, which is here 1200 feet in breadth, is crossed by a railway bridge which connects Mannheim with Ludwigshafen; a chain bridge spans the Neckar. The town is remarkable for its cleanliness and is the most regularly built town in Germany; the main part is divided into 136 square sections and is encircled by a semicircular boulevard known as the Ring Strasse. Outside of the semicircle are numerous suburbs. The palace, built 1720-29, by the Elector Palatine Charles Philip, with a front of over 1700 feet, and 1500 windows, is one of the largest buildings of the kind in Germany. It has several museums, containing paintings by Van Ruysdael and Rubens, and a library of 66,000 volumes. The city contains a Gymnasium with a library, a botanic garden, an observatory, an ancient merchants' hall, the National Theatre, founded in 1776, in which Schiller's *Robbers* was first acted, and the large concert hall. Among notable public monuments are those of William I, Prince Bismarck, Schiller, and Moltke. The Schlossgarten, bordering on the Rhine, is the chief of the five public gardens surrounding the city. Since the construction of harbors (covering 240 acres) and extensive docks in 1875 and 1897, Mannheim has had a great and increasing trade in grain, coal, petroleum, tobacco, sugar, and ironware. Its metal and machine works, in-

cluding the manufacture of agricultural implements, gasoline, and electric motors, give employment to 10,000 persons; 2000 are engaged in a celluloid factory. Cigars, varnish and rosin, carpets, rubber, cables, railway supplies, wire, stoves, chemicals, oil, furniture, brushes, mirrors, sugar, mattresses, glass and leather goods are also manufactured. Its institutions include Gymnasia, a reformatory, a trade school, a marine school, and a conservatory of music. Pop., 1885, 61,273; 1900, 140,384; 1910, 193,902. The United States is represented by a consul.

Mannheim is mentioned as a village as early as 764. Its prosperity dates from 1606, when, under the Elector Palatine Frederick IV, it became the refuge of religious exiles from the Netherlands. It suffered severely in the Thirty Years' War and was almost totally destroyed by the French in 1689. After being rebuilt it was again occupied by the French in 1795 and a large part of it burned. In 1802 it was given to Baden.

MANNING, DANIEL (1831-87). An American journalist, financier, and politician. He was born in Albany, N. Y., and at the age of 10 entered the printing office of the Albany *Atlas* as an apprentice. After the consolidation of the *Atlas* with the *Argus* he was appointed legislative reporter, in which capacity he made a wide acquaintance among politicians and became known as an authority on State political affairs. In 1865 he became editor and part owner of the *Argus*, and president of the company in 1873. In 1876 he was elected a member of the New York Democratic State Committee, of which he became secretary in 1879 and chairman in 1881. In this position he was associated closely with Grover Cleveland, to whose election as Governor of New York he contributed greatly in 1882. To Manning's astuteness and tact also was largely due the successful presentation of Cleveland's name as a candidate for the presidency in 1884, and to his personal supervision of the campaign was largely due the success of the Democratic ticket in the pivotal State of New York. President Cleveland occasioned considerable surprise when he appointed Manning Secretary of the Treasury. Manning remained in office until 1887, and his able administration justified his appointment. He retired shortly before his death, on account of ill health.

MANNING, HENRY EDWARD (1808-92). An English Roman Catholic prelate, one of the most notable figures in the Church life of his time. He was born July 15, 1808, at Totteridge, in Hertfordshire, and educated at Harrow and at Balliol College, Oxford, where he graduated in 1830. He was ordained in the Church of England in 1832, married in 1833, and in 1834 appointed rector of Lavington and Graffham in Sussex. His wife died in 1837. Manning devoted himself with increasing zeal, energy, and success to the work of his profession, and was recognized, though still a young man, as a leading figure in the group of Tractarian leaders. His appointment in 1840 as Archdeacon of Chichester gave him a still more influential position. Newman's secession affected him painfully and for a time seemed to increase his attachment to the Church of England; but in 1851 the decision in the noted Gorham case (see GORHAM CONTROVERSY), which seemed to claim for the crown authority over a purely doctrinal question, shook his allegiance. After long and arduous consideration he made his submission to the Roman

Catholic church in 1851. Only two months later—an unusual recognition of his gifts and his theological attainments—he was ordained priest by Cardinal Wiseman. He made some further studies in Rome, and from 1852 to 1856 was informally connected with the Jesuit Church in Farm Street, London, finding much to do in preaching and spiritual direction. In 1857 he developed an English congregation of priests known as Oblates of St. Charles, a revival of the community founded at Milan by St. Charles Borromeo, and became its first superior. The same year saw his appointment as provost of the Chapter of Westminster, which brought him into close relations with Cardinal Wiseman, then Archbishop. In the difficult circumstances connected with the insubordinate attitude of Archbishop Errington, Wiseman's coadjutor, Manning was a loyal supporter of the Cardinal and of great service. On the latter's death in 1865, Pius IX took the unexpected step of appointing Manning his successor as Archbishop of Westminster, and for the next quarter of a century he occupied a commanding position in the religious life of England. He not only did much to bring the Roman Catholic body out of the obscurity in which centuries of repression had left it, but he was indefatigable in all kinds of good works—the care of the poor, religious education, and very prominent in social and temperance work. In the Vatican Council of 1870 he took a prominent part, standing among the pronounced advocates of defining papal infallibility, and engaging in a controversy, famous at the time, with Monseigneur Dupanloup, Bishop of Orléans. His *Petri Privilegium* (1871) is an exposition of the doctrine and an account of the proceedings. On the same subject he also published (1875) an answer to Gladstone's expostulations, giving his views of the bearing of the Vatican decrees on civil allegiance; and in 1877 he wrote *The True Story of the Vatican Council*. Among Manning's other published works are: *The Temporal Mission of the Holy Ghost* (1865); *The Internal Mission of the Holy Ghost* (1875); *England and Christendom* (1867); *Sin and its Consequences* (1876). His manifold services were recognized by the gift of a cardinal's hat in 1875. He died in London, Jan. 14, 1892.

Bibliography. The fullest biography of him is by E. S. Purcell (2 vols., London, 1896), which is unfortunately disfigured by many misleading inferences and grave faults of taste; it may be corrected in particular as to the facts of the Errington case by Wilfrid Ward's *Life and Times of Cardinal Wiseman* (London, 1897). There is a shorter but in many ways more satisfactory biography by A. W. Hutton (Boston, 1892). Consult also: Francis de Pressensé, *Life of Cardinal Manning* (Philadelphia, 1897); P. H. Fitzgerald, *Fifty Years of Catholic Life and Social Progress* (London, 1901); I. A. Taylor, *The Cardinal Democrat* (St. Louis, 1908); Paul Thureau-Dangin, *English Catholic Revival in the Nineteenth Century* (2 vols., London, 1914); and a number of the biographical works cited under OXFORD MOVEMENT.

MANNING, JAMES (1738-91). An American educator. He was born in Elizabethtown, N. J., graduated at Princeton College in 1762, and was ordained to the Baptist ministry in 1763. Coöperating with an association of Baptist ministers in Philadelphia, he went to Rhode

Island and proposed to the Baptists in Newport a plan for the establishment of a "seminary of polite literature, subject to the government of the Baptists." A charter was obtained in 1764. The next year Manning was appointed president of the institution, which was opened in 1766 as the College of Rhode Island (later Brown University). He served in that office (except during the Revolution, when the school was closed) till 1790, when he resigned. During the greater part of this period he was also pastor of the First Baptist Church in Providence, founded by Roger Williams. His chief educational publication, *Report in Favor of the Establishment of Free Public Schools in the Town of Providence*, indicates his activity in another direction. In 1786 he was elected to the Congress of the Confederation. He was an active Federalist, and it was due largely to his influence that Rhode Island adopted the Constitution and came into the Union. Consult R. A. Guild, *The Life, Times, and Correspondence of James Manning, and the Early History of Brown University* (Boston, 1864). See BROWN UNIVERSITY.

MANNING, ROBERT (1784-1842). An American pomologist, one of the pioneers in horticultural nomenclature. In order to determine the value of varieties he established at Salem, Mass., a fruit garden, in which he raised varieties of all fruits that could withstand the rigor of the climate of that State, and in which at the time of his death nearly 2000 varieties were growing. He published a descriptive catalogue, called *Book of Fruits*, in 1838. Manning was one of the founders of the Massachusetts Horticultural Society, and during his later years was recognized as an authority on horticultural matters, especially on fruit varieties.

MANNING, THOMAS (1772-1840). An English traveler, born Nov. 8, 1772, at Broome, Norfolk, where his father was rector. In 1790 he entered Caius College, Cambridge, where he became distinguished in mathematics; but he left without a degree, owing to his unwillingness to take the oaths. From 1800 to 1803 he studied Chinese in Paris. In 1806 he went out to Canton as doctor. In 1810 he proceeded to Calcutta, whence he made his way into Tibet to Lhasa (1811). He was the first Englishman to enter the Holy City. On returning to England in 1817, after a visit to Peking, a shipwreck near the Sunda Islands, and a call on Napoleon at St. Helena, he lived for several years at a cottage called Orange Grove, near Dartford, in the midst of his Chinese books. There he was visited by the chief literary men of the day. One of his many eccentricities was a long, flowing beard. This he plucked out by the roots before leaving Orange Grove for Bath, where he died May 2, 1840. Manning was familiar with 15 languages and was esteemed the first Chinese scholar in England in his day. Charles Lamb made the acquaintance of Manning in 1799, and a memorable friendship ensued. Consult: Charles Lamb's *Letters and Essays of Elia* ("The Old and the New Schoolmaster" and "A Dissertation on Roast Pig"); also the *Narratives of the Mission of G. Boyle to Tibet and of the Journey of T. Manning to Lhasa*, edited with memoirs by Sir C. R. Markham (London, 1876); W. P. Courtney, in *Dictionary of National Biography*, vol. xxxvi (ib., 1893).

MANNING, THOMAS COURTLAND (1831-87). An American jurist, born at Edenton, N. C. He was educated at the University of North Caro-

lina, was admitted to the bar, and practiced for a time in his native town. In 1855 he removed to Alexandria, La., and built up a large practice. After serving as a member of the Secession Convention, he entered the Confederate army as a lieutenant and in 1863 became adjutant general with the rank of brigadier general. He was a member of the Louisiana Supreme Court (1864-65) and in 1872 a Democratic presidential elector. In 1876 he was temporary chairman of the Democratic National Convention. He was a second time presidential elector in 1876 and in 1880 was appointed to the United States Senate, but the Committee on Elections and Privileges declined to consider his credentials. From 1877 until the adoption of the new Constitution he was Chief Justice of the State Supreme Court. From 1882 to 1886 he was again justice of the Supreme Court and during 1886-87 was United States Minister to Mexico, where he died. He was also trustee of the Peabody Fund from 1880 until his death.

MANNING, WILLIAM THOMAS (1866-). An American Protestant Episcopal clergyman. He graduated B.D. from the University of the South in 1893; was ordained a deacon in 1889 and a priest in 1891; and served as rector at Redlands, Cal. (1892), at Lansdowne, Pa. (1896-98), and at Nashville, Tenn. (1898-1903). For two years (1893-95) he was professor of dogmatic theology at the University of the South. In New York City he was vicar of St. Agnes's Chapel in 1903-04, assistant rector in 1904-08, and thereafter rector, of Trinity parish.

MANNINGTON. A city in Marion Co., W. Va., about 20 miles north of Clarksburg, on the Baltimore and Ohio Railroad (Map: West Virginia, D 2). It has a large pottery, extensive oil and gas interests, glassworks, machine shops, and rich coal mines. The water works are owned by the city. Pop., 1900, 1681; 1910, 2672.

MAN'NINOSE. See CLAM.

MAN'NITE, or **MANNITOL** (from *manna*), $C_6H_{12}(OH)_6$. A hexahydric alcohol found in the manna from *Fraxinus ornus* (Linné), which grows in the basin of the Mediterranean. It was discovered in that manna by Proust in 1806 and may be readily extracted from it with hot water or boiling alcohol. It is found also in many other vegetable products, including onions, celery, asparagus, many fungi, etc.; and it has been prepared artificially from the sugar mannose by reduction with sodium amalgam. Vice versa, careful oxidation of mannite with nitric acid yields mannose. A mixture of mannite and a very similar hexahydric alcohol called sorbite is produced when ordinary fructose (levulose) is reduced with nascent hydrogen (sodium amalgam). Mannite is also produced during alcoholic fermentation, particularly at higher temperatures, and a special mannitic fermentation often occurs in wines, changing the fructose contained in them into mannite. However, the amount of mannite generally discoverable in unspoiled wine is very small. Mannite may be obtained either in the form of rhombic prisms or in the form of silky needle-like crystals; it melts at 165-166° C. (329-330.8° F.), and it is readily soluble in hot water or alcohol, but only moderately soluble in cold water, and scarcely soluble at all in cold alcohol or in ether. Its pure aqueous solution has a very slight action on polarized light; the action is, however, greatly increased by the presence of free alkali as well

as of certain salts, especially borax. The constitution and configuration of mannite are represented by the formula:

The hexahydric alcohols *sorbite* (see above), *dulcite*, *idite*, and *talite* have the same composition and constitution as mannite, and differ from it and from one another only in their configuration, i.e., in the arrangement of their atoms in space. (See STEREOCHEMISTRY.)

MANNLICHER, män'lik-ër, FERDINAND VON (1848-1904). An Austrian engineer and inventor. He was born at Mainz, Germany, and for many years served as chief engineer of the Imperial Northern Railroad (Kaiser Ferdinands Nordbahn). In 1899 he was called to the Austrian Upper House in recognition of his public services. He became widely celebrated through his many inventions and improvements in military small arms and to him was due the original Mannlicher rifle, which with modifications was used in the military services of several European and other nations. See SMALL ARMS.

MANN'S, mäns, SIR AUGUST (1825-1907). A German-English musical conductor, born at Stolzenberg, Pomerania. He received his early training in music from a village musician and from Urban, the town musician of Elbing. He became a member of a military band at Danzig, then at Posen, and in 1848 joined Gungl's orchestra in Berlin. Soon after he became conductor and first violin at Kroll's Garden, Berlin. In 1851 Von Roon, the War Minister, selected Manns as bandmaster of his regimental band, first at Königsberg, then at Cologne. In 1854 he became assistant conductor, and in 1855-1905 was conductor, at the Crystal Palace, London, where he accomplished important results in the furtherance of the newer romantic music of Germany. He also changed the original wind band into an orchestra and founded (1856) the famous Saturday concerts, which he continued till 1901. He conducted the Glasgow Choral Union (1879-92) and six triennial Handel festivals. He was knighted in 1903. Consult H. S. Wyndham, *August Manns and the Saturday Concerts: A Memoir and a Retrospect* (London, 1909).

MAN'NUS (according to some, connected with Goth. *manna*, AS., Eng., OHG. *man*, Ger. *Mann*, Skt. *manu*, man, the mythical father of the human race). According to Tacitus (*Germania*, chap. ii), the name given by the Germans to the son of the earthborn god Tuisto. From his three sons they derived their three great tribes, the *Ingævones*, the *Herminones*, and the *Istævones*. Mannus belongs, not to the Teutonic people alone, but to the great myth of the origin of the human race, common to the whole Aryan family, and, like the Hindu *Manu* (q.v.) or *Manus*, stands forth as the progenitor of the inhabitants of earth endowed with reason. Consult K. Müllenhof, *Deutsche Altertumskunde*, vol. iv (revised by M. Roediger, Berlin, 1900).

MANNY, SIR WALTER, BARON DE (?-1372). An English adventurer, born in Hainault, France. He first appeared in England probably in 1327 as an esquire of Queen Philippa. He was engaged in the Scottish wars in 1331-37 and again in 1341; had command of English fleets in 1337 and 1348; served under Edward

III in the wars in France between 1338 and 1360; and was second in command in the invasion of France by John of Gaunt in 1369. He served as a baron by writ in Parliament in 1347-71 and was knighted in 1359. Much space is given to his exploits in Froissart's *Chronicles* (Eng. trans., London, 1895). He is chiefly known as one of the founders of the Charterhouse in London.

MANNYNG, ROBERT (or ROBERT DE BRUNNE) (flourished c.1290-1340). An English poet, native of Brunne, or Bourne, in Lincolnshire. In 1288 he joined the neighboring brotherhood of Gilbertine canons at Sempringham. There he wrote *Handlyng Synne* (1303), a free paraphrase of the *Manuel des Pechiez* by William of Wadington. It depicts, with much sharp satire, the social life of the time. The best manuscript (the Harleian), with the French original, was edited by F. J. Furnivall for the Roxburghe Club in 1862. In 1338 Mannyng, then resident in the Gilbertine priory of Sixhill, Lincolnshire, finished his *Chronicle of England*. It has little historical value, as it closely follows the earlier chronicles. The earlier part of the *Chronicle* was edited by Furnivall for the Rolls Series (London, 1887); and the latter part by T. Hearne in 1725. To Mannyng is also attributed *Meditacyuns of the Soper of oure Lorde Ihesus*, edited for the Early English Text Society (London, 1875). Consult T. L. K. Oliphant, *Old and Middle English* (London, 1878), and B. A. K. Ten Brink, *Early English Literature to Wiclif*, translated by H. M. Kennedy (New York, 1883).

MANOA, mā-nō'ā. A fabulous city said to have been built on an island in Parima Lake, Guiana, and governed by El Dorado (q.v.).

MANOANS. See CONIBO.

MANOBO, mā-nō'bō. The Manobo is a powerful pagan tribe inhabiting the lower Agusan River valley in Mindanao. They closely resemble the Mandaya in bodily appearance and culture and, like them, are frequently tree dwellers. They practice a crude agriculture and are somewhat skilled in forging iron knives and spear heads. For centuries they have been slaveholders, and their extensive raids into the territory of neighboring tribes have caused them to be greatly dreaded. They probably number more than 50,000. See PHILIPPINE ISLANDS.

MANOEL, mā-nō'āl'. The Portuguese form of Manuel (q.v.).

MANOEL DO NASCIMENTO, mā-nō'āl' dō nā'shē-mān'tō, FRANCISCO. A Portuguese poet. See NASCIMENTO, FRANCISCO MANOEL DO.

MANŒUVRES, mā-nōō'vērz (Fr. *manœuvre*, OF. *manouvre*, *manovre*, from ML. *manuopera*, *manupera*, a working with the hand, from Lat. *manus*, hand + *opera*, work). Exercises of large or small bodies of troops, designed to teach in time of peace the duties of troops in war. Manœuvres are conducted in two ways: (1) by field exercises on the terrain itself, during which actual bodies of troops are manœuvred in accordance with the tactical principles involved; (2) on special maps, where the movements of troops are indicated by colored bits of paper. The latter are known as "map manœuvres" and are finding increasing favor in the instruction of officers in all armies. (See WAR GAME.) In Europe field manœuvres are carried on in most great armies throughout the year, the grand manœuvres (of one or more army corps) usually taking place in the autumn,

and simulating the conditions of war as closely as possible. In the United States there are similar operations, usually held in the fall, in which the regular army and the militia participate.

Naval manœuvres and the combined manœuvres of sea and land forces working in harmony are of more recent origin than their military counterpart. Frederick the Great of Prussia first conceived the idea of having sham battles between his troops, an idea which Napoleon utilized in the great camp of Boulogne in 1805, during his preparation for the invasion of England. It was Von Moltke, however, and the Prussian general staff who first developed the idea of manœuvres into its full modern significance, and in the combined naval and military operation around the city of Flensburg in Schleswig-Holstein (1890) set an example which was soon copied. The United States naval and military manœuvres held in 1902 in the vicinity of New York followed practically the same plan of campaign as did Germany in the instance already cited. England and France and the United States hold periodical naval manœuvres, the problem usually being the attack or defense of shore defenses. In naval manœuvres particularly, conditions may be created which are faithful replicas of actual battles and campaigns. Besides their value in the formulation of the most effective scheme of shore defense against attack or invasion, they are just as important in the training under war conditions of the naval personnel, besides which they afford commanders excellent experience in the practice of battle tactics and strategy. Flaws in methods and material which otherwise might not be discovered until too late are noted and subsequently remedied; new ideas in the application of strategic or tactical principles carried out; the employment of torpedoes, mines, destroyers, submarines, wireless telegraphy, searchlights, air craft, and the various experiments in coaling at sea thoroughly tested; and the whole carefully observed and noted by officers of the national government appointed for the purpose, whose report usually forms the basis for future naval legislation. See TACTICS, MILITARY; TACTICS, NAVAL; WAR GAME.

MAN OF BLOOD, THE. A designation applied by the Puritans to Charles I of England.

MAN OF BLOOD AND IRON, THE. A name given to Prince Bismarck, originating in a phrase used by himself in regard to the settlement of the differences of Prussia and Austria.

MAN OF DECEMBER, THE. Napoleon III, so called because of his coup d'état of Dec. 2, 1851.

MAN OF DESTINY, THE. A name given to Napoleon Bonaparte, who considered himself specially chosen and directed by fate.

MAN OF LAW'S TALE, THE. One of Chaucer's *Canterbury Tales*. It is the story of Constance, told in Gower's *Confessio Amantis*, and taken from old French romances.

MAN OF MODE, THE, or SIR TOPLING FLUTTER. A comedy by George Etherege, presented in 1676.

MAN OF SIN. See ANTICHRIST.

MAN-OF-THE-EARTH. A weed. See IPOMŒEA.

MAN-OF-WAR. An armed naval vessel regularly commissioned by some acknowledged government and fitted for purposes of war. As such she possesses the privileges of war; her

deck is, by a legal fiction, taken to be a portion of the soil of the nation whose flag she hoists; in time of war she is justified in attacking, sinking, burning, or destroying the ships and goods of the foe, and, by the law of nations, she may stop and search the merchant vessels of neutral powers which she suspects of carrying aid to her enemy. (See INTERNATIONAL LAW; CONTRABAND OF WAR; NEUTRALITY.) In case of being overpowered the crew of a man-of-war are entitled to the ordinary mercy granted to vanquished combatants lawfully fighting. Any vessel making war, but not belonging to an acknowledged government, is technically either a privateer (See MARQUE, LETTERS OF) or a pirate, but the naval war waged by vessels belonging to insurgents is not regarded as piracy if solely directed against the forces of the government they are fighting (see PIRACY). See BATTLESHIP; CRUISER; FRIGATE; SHIP, ARMORED; SHIPBUILDING; NAVIES; RAM; MORTAR VESSEL; TORPEDO BOAT.

MAN-OF-WAR, PORTUGUESE. See PORTUGUESE MAN-OF-WAR.

MAN-OF-WAR BIRD, or HAWK (so called from its predatory habits). A frigate bird (q.v.); but occasionally the term is applied to some other swift and predacious sea fowl, as a skua.

MANOGRAPH (from Gk. *μᾶνός*, *manos*, thin, and *γράφειν*, *graphein*, to write). An instrument designed to render visible to the eye the varying pressure in an engine cylinder or other confined space in which the pressure changes with a cyclically varying volume. (See INDICATOR.) It is specially adapted for the high speeds and high temperatures of the internal-combustion motor. (See GAS ENGINE; INTERNAL-COMBUSTION ENGINE.) The fundamental principle is to have the pressures of the cylinder received upon a steel diaphragm of calibrated resistance to deformation by such pressure. The yielding of the diaphragm to pressure is measured by the motion of a very small mirror, which reflects a ray of light from an electric arc. The flexure of the diaphragm moves the mirror around an axis and causes the beam of reflected light to move vertically over a ground-glass surface in its path. The rise and fall of the spot of light measures the pressure on the diaphragm. To relate the position of the spot of reflected light to the position of the piston of the engine the mirror receives from the engine shaft a synchronous movement of rotation through a small angle around an axis at right angles to that of its motion from pressure. The position of the spot of light is therefore at any instant the resultant of the pressure and of the piston motion. The spot of light will therefore trace a diagram like an indicator diagram in which vertical ordinates are pressures and horizontal displacements or abscissas are the piston motions or cylinder volumes. If the ground glass for optical observation be replaced by a sensitized photographic plate a diagram of pressure and volume relations is photographically recorded. The manograph has very little inertia or friction; its motion is very small and the multiplication of motion is done optically and without complications. The objection to it is the uncertainty whether the known static pressures of calibration produce the same movement of the diaphragm as the dynamo's impact of the cylinder pressures, and whether the latter are translatable into the same units as the former.

MANOMETER (from Gk. *μᾶνός*, *manos*, thin, rare + *μέτρον*, *metron*, measure). An instrument for measuring the density or pressure of the air or any gas. A barometer (q.v.) is one form of manometer, as the pressure of the atmosphere is measured by the height of the column of mercury which it supports. The manometer in its simplest form would be a glass tube open at both ends and bent into the form of a U and containing a sufficient quantity of some liquid to cover the bend and rise to a small height in each arm. The vessel containing the gas whose pressure is to be ascertained is connected with one arm of the tube, and if the gas is at the same pressure as the atmosphere the liquid will stand at the same level in both tubes. If the gas is at a greater pressure the liquid in the arm of the tube on which it acts will be at a lower level, and the pressure of the gas will be obtained by adding to the pressure of the atmosphere the weight of a column of the liquid whose height is equal to the difference in level in the two tubes. When the pressure of the gas is considerably greater than that of the atmosphere we use mercury on account of its high specific gravity, and when the pressures are sufficient a tube with one arm closed can be employed and the pressure determined by measuring the extent to which the air is compressed. Now, according to Boyle's or Mariotte's law, a pressure exerted on the column of mercury sufficient to force the air into half the space it occupies at the normal atmospheric pressure must become doubled, or 15 pounds to the square inch must be added. Again, to compress the air into half the remaining space, 30 pounds, or double the pressure required for the reduction to the first half, must be added, making in all a pressure of four atmospheres for the reduction to one-fourth the original volume. It is evident, therefore, that a graduated scale, to exhibit the degrees of pressure, must have its spaces decrease from below upward. If the gas is considerably rarer than the air, as, e.g., in the receiver of an air pump, we employ a shortened barometer consisting of a bent tube with one end closed but filled with mercury, which is supported by the pressure of the atmosphere. In this case the pressure is measured by the difference in level of the two columns, which would be zero were the vacuum perfect.

These manometers are of course constructed in various forms, depending upon the use to which they are to be put, and the tubes and air chambers are variously constructed. The most common form of manometer is the steam gauge, which may be either a piston actuated by the

MANOMETER.

A, for pressures greater than one atmosphere; B, for pressures less than one atmosphere.

pressure to move an indicator against the force of a spring, or more commonly a metal tube of elliptical cross section bent into circular shape. One end of this tube is permanently fastened to the case of the instrument and through it the steam or gas enters, while the other end is closed but free to move. It is connected with a spring

BOURDON PRESSURE GAUGE, WITH FACE REMOVED.

and a series of levers, so that its motion, which depends upon the pressure, is communicated to an indicator moving over a scale graduated usually in pounds in the United States and England and atmospheres in Europe. These steam gauges must of course be adjusted and calibrated by reference to some direct source of pressure, such as would be furnished by a column of liquid in a vertical tube. See MANOGRAPH.

MANON, má'nôn'. An opera by Massenet (q.v.), first produced in Paris, Jan. 19, 1884; in the United States (New York), Dec. 23, 1885.

MAN ON HORSEBACK, THE. A name given to the French General Boulanger (q.v.), who usually appeared in public riding a black horse.

MANON LESCAUT, má'nôn' le-skô'. A noted romance by the Abbé Prévost. It was published in 1731 and was originally only an episode of his *Mémoires d'un homme de qualité*.

MANON LESCAUT. An opera by Puccini (q.v.), first produced in Turin, Feb. 1, 1893; in the United States (Philadelphia), July, 1894.

MAN'OR (Fr. *manoir*, from Lat. *manerium*, a dwelling place, from *manere*, to abide, to dwell). A district of land held by "some baron or man of worth" by freehold tenure of the king or of some mesne lord, within which the lord of the manor exercises a certain jurisdiction in addition to his rights as landlord. The term "manor" to describe such a lordship did not come into use in England till some time after the Norman Conquest, but the institution is found in a less-developed form among the Anglo-Saxons. The typical manor, in its later development, consisted of two parts: (1) the inland (*demesne*) or home estate, which the lord held in his own hands, upon which his house was built, and which was farmed by nonfree, peasant occupiers, and (2) the outland (*genetland*), which was held, in part at least, by freemen as freehold tenants, holding of the lord at a rent, which might be money, or produce of the land, or military or other service. The tenants proper were freemen, but most of the occupiers

who constituted the lord's dependents, belonged to one or more of the classes of the unfree (as villeins), who constituted the bulk of the peasant population. These for the most part dwelt together in villages and lived ordinarily by agriculture. It is held by writers like Gneist, Stubbs, and Freeman that originally there were few manors, but that they gradually increased in number, until in the twelfth century the prevailing system of society, outside the boroughs or incorporated towns, was that of manors with dependent peasants. The origin of the manor is obscure, some authorities, as Seebohm, holding it to be due to the imposition of the system of the Roman villa on the servile population by the Norman invaders; others, like Maitland, seeing in it a normal development of the village community.

As has been said, the lord of a manor might hold directly by grant of the king, who was, under the feudal system, the supreme landowner, the lord paramount, of all lands in the kingdom, in which case his customary jurisdiction, based upon and derived from the ancient customs of his manor, might be restricted or enlarged by the royal grant; or he might hold under some mesne lord, who in his turn held the manor, together with other lands, directly of the crown. With the growth of the process of subinfeudation, i.e., of the granting of lands by a tenant to be held of himself as overlord, the latter method of holding manors became common in the thirteenth and fourteenth centuries. Where one lord held two or more manors, whether of the king or of a mesne lord, the entire estate was known as a lordship or honor.

MANOR HOUSE. The residence of the lord of the manor. This was an important subject of architectural design under the Tudor kings in England, when such manor houses were built as Loseley, Westwood, Levens Hall, North Cadbury, and many others. Under Elizabeth and James I (1558-1625) the manor house was developed to imposing proportions upon monumental plans with sumptuous decorations and furnishings (Wollaton House, Longleat, Burghley, Aston, Bramshill, Hatfield, and scores of others).

MANO'RIAL COURT. See MANOR.

MANOURY, GENERAL. See SUPPLEMENT.

MAN-RAISING KITE. See MILITARY OR MAN-RAISING KITE.

MANRESA, mán-rá'sà. A town in the Province of Barcelona, Spain, 30 miles northwest of the city of that name (Map: Spain, F 2). It is picturesquely situated on the left bank of the Cardener, and in an amphitheatre of hills crowned by a large Gothic cathedral of the fourteenth century. It has a high school, conducted by the Jesuits, and in the neighborhood are the convent of Santo Domingo, built near, and the church of San Ignacio, built over, the cave in which Ignatius of Loyola dwelt for a year, and which is on that account a place of pilgrimage. The surrounding region is irrigated by a canal fed by the Llobregat River. Manresa has manufactures of cotton and woolen yarns and silk fabrics. In 1811 it was set on fire by Marshal Macdonald. Pop., 1900, 23,416; 1910, 23,036.

MANRIQUE, mán-ré'kà, GÓMEZ (?1415-?1490). A Spanish poet, dramatist, soldier, and statesman, born of a noble family. Unfortunately, from a literary point of view, he was the nephew of the Marqués de Santillana (q.v.) and the uncle of Jorge Manrique (q.v.), both of

whom are more celebrated than he. None the less he played an important part in the disturbances of the reigns of John II, Henry IV, and Isabella II. In his earlier lyrics he adhered to the Gallegan methods, but he soon affiliated himself with the movement that aimed to Italianize Castilian poetical forms. He attained some success in the composition of the political satire, but the pathetic note is the most distinctive one in his lyrics. Gómez also essayed the drama in several pieces, the best of which is the liturgical play, *Representación del nacimiento de Nuestro Señor*. But he tried also a couple of *momos* that are not without merit. In short, he foreshadowed both the sacred and profane elements in the Spanish drama. Consult his *Cancionero*, edited by A. Paz y Melia (2 vols., Madrid, 1885-86), and Marcelino Menéndez y Pelayo, *Antología de poetas líricos castellanos*, vol. vi (ib., 1896).

MANRIQUE, JORGE (1440-1479). A Spanish poet and soldier, nephew of Gómez Manrique (q.v.). He fell in the battle of the fortress of Garcí-Múñoz, when yet hardly old enough to have attained the fullness of his poetical power. The greater part of his verse, preserved in the *Cancionero general* of 1511 and in other *cancioneros*, gives little evidence of any extraordinary merit in him, and his fame is really based on a single poem, that written in commemoration of the death of his father, the Maestre de Santiago. This suffices, however, to make his name one to be remembered as long as his language remains intelligible. In verses mournfully sweet of tone the exquisite *coplas* of this composition proclaim the vanity and brief duration of all things terrestrial and the necessity of yielding to death, as even the most powerful and exalted of human beings have had to do. Longfellow's graceful translation of the poem has preserved much of the dignity and pathos of the original. The Spanish text may be found in *Biblioteca de autores españoles*, vol. xxxv (Madrid, 1782), and in the *Bibliotheca Hispanica*, vol. xi (ib., 1902), Jorge Manrique, *Coplas por la muerte de su padre* (ed. R. Foulché-Delbos). Consult also Marcelino Menéndez y Pelayo, *Antología de poetas líricos castellanos*, vol. vi (ib., 1896).

MANS, mäs, or MAN-TSE, män'tsə'. An aboriginal people occupying some of the mountainous parts of the Chinese provinces of Szechwan and Yunnan, portions of Tongking, etc., a division of the Moïs (q.v.). During the last half century they have been forced more and more into the hills. The Mans are short in stature and mesocephalic. They are more or less nomadic and do not mix readily with other peoples of the country. They are looked upon as part of the aboriginal population of Szechwan, driven back into Yunnan about the third century A.D. by the advance of the Chinese, and now moving seaward along the heights of land. The Mans and the Lolos (q.v.) seem to be linguistically related. Consult Verneau in *L'Anthropologie* (Paris, 1896).

MANS, män, LE. The capital of the Department of Sarthe, and formerly of the Province of Maine in northwest France. It is situated in the centre of the department, on a hill above the left bank of the river Sarthe, 116 miles southwest of Paris (Map: France, N., F 4). It is an old town, but has some wide streets, many monuments, and several parks and promenades. The most notable building is the cath-

edral of St. Julien, which is one of the most beautiful churches of France. It was built in the period between the eleventh and the fifteenth centuries, and has a magnificent choir built in pure Gothic style and some beautiful stained-glass windows. It holds the tomb of Berengaria, the Queen of Richard Cœur de Lion. The church of Notre Dame de la Couture is also noted for its sculptures. The town has a seminary, two normal schools, a school of music, a lyceum, a museum of natural history, a public library containing 53,000 volumes and 600 manuscripts, and paintings by Corot, Constable, Ruysdael, and Troyon. There are also excellent museums of natural history, art, and archæology. The principal manufactures are chemicals (especially sulphuric acid), tobacco, sailcloth, instruments and clocks, cereals, cordage, oil, paints, leather, woolen goods, machinery, railway cars, agricultural implements, stained glass, chocolate, and candles. There is a chamber of commerce and of agriculture, and the town has considerable trade in cattle, poultry, eggs, fruit, grain, and wine. Pop. (commune), 1901, 63,272; 1911, 69,361. It is the headquarters of the Fourth Army Corps.

Le Mans existed before the Roman conquest. Its original name was Vindinum. It was the chief city of the Cenomani, from whom it received its present name. It was fortified by the Romans in the second century, and became one of the most important cities of the Frankish Kingdom. It was taken by William the Conqueror in 1063 and suffered many sieges during the long Anglo-French wars. The Vendéans were defeated here in December, 1793, and the city subjected to a massacre. In 1871 it was the scene of the defeat of Chanzky's army by the Germans under Prince Frederick Charles, in a battle lasting from the 10th to the 17th of January. It is the birthplace of Henry II, Duke of Normandy and afterward King of England.

MANSARD (män'särd) ROOF. A form of roof named after N. François Mansart (q.v.). It is constructed with a break in the slope of the roof, so that each side has two planes, the lower being steeper than the upper. This kind of roof has the advantage over the common single-slant form of giving more space in the roof for living room.

MANSART, män'sär', JULES HARDOUIN (1646-1708). A French architect, born in Paris, grandnephew of N. François Mansart, whose name he assumed in addition to his own family surname Hardouin. His father was peintre ordinaire du roi. He studied under his granduncle and under Bruant. The latter presented him to Louis XIV, to whose order he built the Château de Clagny for Madame de Montespan (1672). In 1675 he was admitted to the Académie d'Architecture, and from that time on, as architect of the King and contrôleur-général des bâtiments, he was occupied mainly with his two most important works, the dome of the Invalides (q.v.) and the palace at Versailles. The latter was almost wholly his design, though the core of the central block was the work of Leveau under Louis XIII and the chapel was completed by De Cotte after Mansart's death. The Grand Trianon, the Château de Marly, and the Place Vendôme at Paris (but not its column) were also his work. The triple-shelled dome of the Invalides was completed from his design in 1735; it is regarded as his greatest and most original achievement.

MANSART, NICOLAS FRANÇOIS (1598-1666). A French architect, born in Paris, the son of a carpenter. Besides earlier works of less importance, he designed the extension of the Hôtel Carnavalet (1634); the Hôtel de la Vrillière (now the Banque de France) in 1635; the west wing (wing of Gaston d'Orléans) of the château of Blois (1635), and after 1645 the church of the Val-de-Grâce for Anne of Austria and the beautiful château of Maisons-sur-Seine for Louis XIV. Owing to his unreasoning extravagance in construction he was not permitted to complete the Val-de-Grâce, which was turned over to Jacques Lemercier (q.v.) for completion; but he erected a reduced replica of his design as a chapel for the Château de Fresnes. His work is noted for its classical refinement and purity of detail. His treatment of high roof stories gave rise to the term "Mansard roof" (*toiture à la Mansarde*). The spelling Mansard is not a correct form of the name.

MANSE. In Scots law, the dwelling house of a minister of the Established church. Every minister of a rural parish is entitled to a manse, which the heritors, or landed proprietors, are bound to build and maintain; and he is also entitled, as part of the manse, to a stable, cow house, and garden. The manse must, by statute, be near to the church. The amount fixed by law as the allowance for the manse has varied from time to time, and it may vary more or less according to circumstances, but it is now usually fixed at a value of £1000. It is only the ministers of rural parishes that are entitled to manses, and not ministers of royal burghs, where there is no landward district.

MANSEL, HENRY LONGUEVILLE (1820-71). An English metaphysician, born at Cosgrove, Northamptonshire. He graduated at St. John's College, Oxford, in 1843, and in 1855 was appointed reader in moral and metaphysical philosophy in Magdalen College. At Oxford he became Waynflete professor in 1859 and in 1867 professor of ecclesiastical history. In 1869 he was appointed dean of St. Paul's Cathedral, London. He belonged to the school of Sir W. Hamilton, whose lectures he edited (1859) with the assistance of Professor John Veitch. He was well versed in metaphysical philosophy and wrote in a clear and finished style. The best known of his publications is his *Bampton Lectures* (1858-59; 5th ed., 1867) on "The Limits of Religious Thought," in which, applying the idea developed in Hamilton's articles, "The Philosophy of the Unconditioned," he maintained that any attempt to arrive at an idea of the Absolute through the categories of substance or cause is attended by insurmountable difficulties. It was urged by many that the work, though purporting to be theistic, was really agnostic, and Spencer asserted (in the prospectus to his *Synthetic Philosophy*, 1860) that he was merely working out "the doctrine put into shape by Hamilton and Mansel." Controversies resulted between Mansel and F. D. Maurice and Goldwin Smith, and Mansel characterized his opponents' statements as misrepresentations. His further works include: *Prolegomena Logica: An Inquiry into the Psychological Character of Logical Processes* (1851; 2d ed., 1862); *The Philosophy of the Conditioned* (1866); *Letters, Lectures, and Reviews* (1873); *The Gnostic Heresies of the First and Second Centuries* (1875; ed. by J. B. Lightfoot, with biographical sketch by Lord Carnarvon). Consult the sketch referred to; also J. W. Burgon,

Lives of Twelve Good Men (London, 1888), and A. W. Benn, *History of Rationalism* (ib., 1906).

MANSFELD, mǎns'felt, ERNST, COUNT (1580-1626). A German soldier, born in Luxemburg. He was the illegitimate son of Peter Ernst, Count of Mansfeld, and was educated by his godfather, Archduke Ernst of Austria. In return for valuable military services under his half brother in Austria he was legitimized by Rudolph II. The title and estates of his father were, however, withheld from him, and in revenge he joined the enemies of Austria in the Thirty Years' War as a staunch Protestant champion. He fought gallantly in Bohemia and on the Rhine for the Elector Palatine. His efforts failed, but brought him great renown. In 1625, under the leadership of Christian IV of Denmark and aided by English and French subsidies, he again attacked Austria. Wallenstein met and overcame his force at Dessau, April, 1626. But Mansfeld soon gathered a new army of 12,000 men and marched, in the summer of the same year, through Moravia and Hungary to join the forces of Bethlen-Gábor (q.v.) of Transylvania. When the latter made peace with the Emperor, Mansfeld tried to escape to Venice, but died on the way, in Rakowitz, near Serajevo, before the close of the year. Consult: Reuss, *Graf Ernst von Mansfeld in böhmischen Krieg, 1618-21* (Brunswick, 1865); Villermont, *Ernest de Mansfeld* (Brussels, 1866); Grossmann, *Des Grafen Ernst von Mansfeld letzte Pläne und Taten* (Breslau, 1876).

MANSFIELD, mǎnz'feld. A market town and municipal borough in Nottinghamshire, England, 16 miles north of Nottingham, surrounded by the remains of the ancient forest of Sherwood (Map: England, E 3). The town is regularly built and has an early Norman church, a grammar school founded in 1561, 12 almshouses founded in 1693, and other charitable institutions. Its public buildings include a town hall and municipal offices, a mechanics' institute, free library and isolation hospital, and it owns water, gas, markets, bath, and pleasure grounds. It stands in the centre of a large manufacturing and coal-mining district. It manufactures shoes, machinery, lace, silk and cotton goods, and brick and tile. It is an important centre for cattle and agricultural produce. Many relics excavated in the vicinity point out that Mansfield was the site of a Roman station. Pop., 1901, 21,400; 1911, 36,888.

MANSFIELD. A town in Bristol Co., Mass., 24 miles south by west of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). Noteworthy features include the Memorial Library, the town hall, and the high school. Among the products manufactured are machinists' tools, chocolate and cocoa, straw and felt hats, and baskets. The municipality owns a fine water-supply system and the electric-light plant. Pop., 1900, 4006; 1910, 5183.

MANSFIELD. A city and the county seat of Richland Co., Ohio, 79 miles southwest of Cleveland, on the Baltimore and Ohio, the Erie, and the Pennsylvania railroads, and interurban lines connecting with points on the Big Four System (Map: Ohio, E 4). It is on the Lincoln highway, at an elevation of 1487 feet, and has the Ohio State Reformatory, a memorial soldiers' and sailors' building, a public library, Sherman-Heineman Park of 100 acres, and two smaller parks. The city is an important trade centre

for the adjacent agricultural country, and is noted for the diversity of its manufactures, which include threshing machines, farm tractors and small farm implements, boilers, engines, engine fittings and brass goods, stoves, pumps, interior sanitary appliances, chains, brick, automobile tires, steel sheets, buggies, cigars, webbing and suspenders, electrical and electric-railway supplies, etc. Mansfield is governed under the Ohio municipal code, which provides for a mayor, elected biennially, a city council, and administrative boards of public safety and of public service. The water works are owned and operated by the municipality; also a large sewage and garbage disposal plant. Settled in 1808, Mansfield was first incorporated in 1828. It was the home of John Sherman (q.v.). Pop., 1900, 17,640; 1910, 20,768; 1914, 22,100; 1920, 27,824.

MANSFIELD. A borough in Tioga Co., Pa., 36 miles southwest of Elmira, N. Y., on the Tioga River and on the Erie Railroad (Map: Pennsylvania, G 2). It is the seat of a State normal school with a library of nearly 6000 volumes, and has a Carnegie library. The annual county fair is held here in beautiful Smythe Park. Mansfield is a shipping point for hay, cattle, and dairy products, stock and farm produce, and there are manufactures of condensed milk and wood novelties. Pop., 1900, 1847; 1910, 1654.

MANSFIELD, MOUNT. The highest peak of the Green Mountains in the State of Vermont, situated in the northwestern part of the State, 20 miles east by north of Burlington (Map: Vermont, C 3). It rises 3000 feet above the surrounding country and has three peaks, the highest of which is 4364 feet above sea level. Its summit affords one of the finest views in New England, including Lake Champlain with the Adirondacks beyond, and a large part of the Green and White mountains.

MANSFIELD, EDWARD DEERING (1801-80). An American author, born in New Haven, Conn. He graduated at West Point in 1818, but declined to enter the army and studied at Princeton, from which he graduated in 1822. In 1825 he was admitted to the Connecticut bar. He afterward removed to Cincinnati, and in 1836 became professor of constitutional law in Cincinnati College. Shortly afterward, however, he abandoned the legal profession to engage in journalism, and edited successively the *Cincinnati Chronicle* (1836-49), *Atlas* (1849-52), and *Railroad Record* (1854-72). While editing the *Chronicle* and *Atlas* he introduced many young writers to the public, among whom was Harriet Beecher Stowe. He was Commissioner of Statistics for the State of Ohio from 1859 to 1868, was a member of the Société Française de Statistique Universelle, and published: *Political Grammar of the United States* (1835); *Life of Gen. Winfield Scott* (1848); *History of the Mexican War* (1849); *American Education* (1851); *Memoirs of Daniel Drake* (1855); *A Popular Life of Ulysses S. Grant* (1868); *Personal Memories* (1870), an interesting social and political chronicle reaching to the year 1841.

MANSFIELD, JOSEPH KING FENNO (1803-62). An American soldier. He was born in New Haven, Conn., graduated second in his class at West Point in 1822, was assigned to the Engineer Corps as brevet second lieutenant, and during the next 24 years was engaged almost continuously on engineering work for the government, his most important service being the construction of Fort Pulaski, for the defense of

Savannah River, Ga., to which he devoted most of his time between 1830 and 1846. During the Mexican War he served throughout the northern campaign as chief engineer under General Taylor, with the rank of captain, constructing and aiding in the defense of Fort Brown, taking a prominent part in the battle of Monterey (where he was wounded) and in the battle of Buena Vista, and receiving the successive brevets of major, lieutenant colonel, and colonel. He then served as a member of the Board of Engineers for the Atlantic coast defense from March, 1848, to April, 1853, and of the board for the Pacific coast defenses from April to May, 1853, and from 1853 to April, 1861, was inspector general of the United States army with the rank of colonel. During the Civil War he was engaged in organizing companies of volunteers at Columbus, Ohio, in April, 1861; commanded the Department of Washington from April to July, 1861; was appointed brigadier general of volunteers in May; was in command of the city of Washington from July to October; then commanded successively at Camp Hamilton, Newport News, and Suffolk, Va.; captured Norfolk, Va., on May 10, 1862; was raised to the rank of major general of volunteers in July; commanded a division in the Army of the Potomac during the Maryland campaign, and was mortally wounded at Antietam on Sept. 17, 1862.

MANSFIELD, RICHARD (1857-1907). An American actor, born May 24, 1857, on the island of Helgoland, where his parents—Madame Rudersdorff (Mansfield), a prima donna, and Maurice Mansfield, a London wine merchant—were staying. He made his first appearance as an actor while at school in England, playing Shylock at a class-day exhibition. His mother wished him to become an artist, and after leaving school he studied painting at South Kensington; but at the age of 17 financial difficulties forced him to seek a surer means of support, and he came to America, where he obtained a position as clerk in a mercantile house in Boston. In 1875 he returned to England, hoping to sell some pictures he had painted in the intervals of his clerical work. Failing in this, he accepted an engagement with a company of strolling actors, and sang in Gilbert and Sullivan operas. He continued to act in England till 1878, when he returned to America and appeared, September 26, in the opera *Les manteaux noirs*. In January, 1883, he won success as Baron Chevrier in *A Parisian Romance*. This was followed by a number of rôles which within 10 years gained him a leading place among American actors. Among his parts were Dr. Jekyll and Mr. Hyde (1887); Richard III, produced in London in 1889; Beau Brummell (1890); Arthur Dimmesdale in his own dramatization of *The Scarlet Letter* (1892); Shylock (1893); Bluntschli in *Arms and the Man* (1894); Dick Dudgeon in *The Devil's Disciple* (1897); Cyrano de Bergerac (1898); Henry V (1900); Monsieur Beaucaire (1901); Brutus in *Julius Cæsar* (1902); Prince Heinrich in *Old Heidelberg* (1903); and the leading parts in *Ivan the Terrible* (1904), *Don Carlos* (1905), Molière's *Misanthrope* (1905), and Ibsen's *Peer Gynt* (1906). Deep study and careful elaboration of detail characterized Mansfield's work.

America in 1897-1900 (New York, 1901); P. Wiltach, *Richard Mansfield* (ib., 1908); W. Winter, *Life and Art of Richard Mansfield, with Selections from his Letters* (2 vols., ib., 1910).

MANSFIELD, WILLIAM MURRAY, first EARL OF (1705-93). A celebrated British jurist. He was born at Scone in Perthshire, Scotland, March 2, 1705, the fourth son of David, Viscount Stormont. He studied at Christ Church, Oxford, took the degree of M.A. in 1730, and was called to the bar in the same year. Through the facility and force of his oratory, as well as through the clearness of his understanding, he acquired a brilliant reputation and an extensive practice; in cases of appeal he was often employed before the House of Lords. In 1741 he was appointed by the ministry Solicitor-General, entered the House of Commons as member for Boroughbridge, and at once took a high position. In 1746 he acted, ex officio, as counsel against the rebel lords Lovat, Balmerino, and Kilmarnock; and in 1754 he was appointed King's Attorney. He became Chief Justice of the King's Bench in 1756. At this time he entered the House of Lords under the title of Baron Mansfield of Mansfield in the County of Nottingham. As his opinions were not those of the popular side, he was exposed to much abuse and party hatred. Junius, among others, bitterly attacked him; and in the Gordon riots of 1780 his house, with all his valuable books and manuscripts, was burned. He declined with dignity indemnification by Parliament. In 1776 he was made Earl of Mansfield. He worked hard as a judge till 1788, when age and ill health forced him to resign. His death occurred on March 20, 1793. He was a brilliant parliamentary debater, fluent, clear, and logical, and one of the greatest who ever sat on the bench. Consult: *Report of Cases Argued and Adjudged in the Court of the King's Bench during the Time of Lord Mansfield's Presidency in that Court* (Dublin, 1794); John Holliday, *Life of William, Late Earl of Mansfield* (London, 1797); *A General View of the Decisions of Lord Mansfield* (ed. by Evans, ib., 1803); J. M. Rigg, in *Dictionary of National Biography*, vol. xxxix (ib., 1894).

MANSFIELD COLLEGE. A theological college at Oxford, England, not incorporated with the university. It was founded in 1886 by the transfer to Oxford of Spring Hill College, Birmingham, and has been erected and supported by the Congregational churches for the study of theology, particularly for the education of Congregational ministers. The buildings consist of an open quadrangle with hall, common rooms, library, lecture rooms, and chapel, and are well designed in Gothic style. Consult W. B. Selbie, "Founding of Mansfield College," in his *Life of Andrew Martin Fairbairn* (New York, 1914).

MANSI, mǎn'sǎ, GIOVANNI DOMENICO (1692-1769). Roman Catholic Archbishop of Lucca. He was born at Lucca, Feb. 16, 1692; taught theology many years at Naples; made literary journeys through Italy, France, and Germany; established an academy in Lucca over which he presided; was made Archbishop in 1765; and died in Lucca, Sept. 27, 1769. He is best known as the editor of the great work on the councils, *Sacrorum Conciliorum Nova et Amplissima Collectio* (31 vols., Florence, 1759 et seq.), which goes down to the middle of the fifteenth century. Consult his *Life* by Zatta (Venice, 1772) and Quintin, *J. D. Mansi et les grand collections conciliaires* (Paris, 1900).

MANSION, mǎn'syǒn', PAUL (1844-). A Belgian mathematician, born in Marchin-le-Huy. He became professor of mathematics in the scientific faculty in the University of Ghent, resigning in 1910. In 1877, with Namur, he published valuable logarithmic tables. His important works on analytical geometry, calculus, etc., include: *Théorie de la multiplication et de la transformation des fonctions elliptiques* (1870); *Théorie des équations aux dérivées partielles du premier ordre* (1875); *Résumé du cours d'analyse infinitésimale, etc.* (1887); *Principes fondamentaux de la géométrie, etc.* (1895); *Mélanges mathématiques* (1874-82, 1883-98); *Introduction à la théorie des déterminants, etc.* (1877; 3d ed., 1899); *Calcul des probabilités* (1906); *Sur la portée objective du calcul des probabilités* (1908). He also translated from the German into French, among such translations being *La divine comédie de Dante* (1887) by Hettinger.

MANSION HOUSE. The name given to the official residence of the Lord Mayor of London, situated opposite the Royal Exchange. It was built between 1739 and 1753 from designs by George Dance, and its hexastyle Corinthian portico is a notable example of the classic revival under George II. State banquets are given in its Egyptian Hall.

MAN'SLAUGHTER. The unlawful killing of another without malice, express or implied. It is this absence of malice which distinguishes the act from murder. Not infrequently persons are charged with this crime who are admittedly free from any moral blame. At common law manslaughter is of two kinds, voluntary and involuntary. The former includes cases of intentional killing, upon sudden heat or passion due to provocation, which palliates the offense; as when the person killed grossly insults or wrongs the slayer or quarrels with him. *Involuntary manslaughter* occurs when the killing is not intended, but results from the commission of an unlawful act which falls below the grade of felony, or from the doing of a lawful act in an unlawful manner, as in cases of culpable negligence. A railroad engineer, a trolley-car motorman, or a horse-car driver, whose negligent misconduct causes the death of a human being is guilty of manslaughter. By modern statutes the offense has been extended to every kind of homicide which on the one hand is not murder and on the other is not justifiable or excusable. It has also been divided into degrees—the first degree including cases marked by unusual cruelty, or by unlawful conduct of a grave character, such as a deliberate assault or the use of dangerous weapons, or administering drugs to produce miscarriage; while the second degree embraces culpable acts and omissions which are less blameworthy. The common law treated manslaughter as a felony, but within the benefit of clergy. Modern statutes in England punish the more serious forms by penal servitude for life and the lighter forms by imprisonment or fine. In the United States manslaughter in the first degree is punishable by imprisonment for a term generally varying from five to 20 years; in the second degree, by imprisonment for a shorter term, or by a fine of a limited amount, or by both fine and imprisonment. See CRIMINAL LAW (consult the authorities there cited); HOMICIDE; MURDER.

MANSO, mǎn'sǎ, JOHANN KASPAR FRIEDRICH (1760-1826). A German philologist and historian, born at Blasienzell (Gotha). He studied at Jena and from 1790 until his death was rector

of an academy at Breslau. As a poet, he was a dry didactic and was ridiculed by Goethe and Schiller in their "Xenien." His translations from the classics—Vergil's *Georgics* (1783) and the *Ædipus Rex* of Sophocles (1785)—were not successful, but the *Geschichte des preussischen Staates bis zur zweiten pariser Abkunft* (3 vols., 1819-20) has more merit and was much read. Consult *Allgemeine deutsche Biographie*, vol. xx (Leipzig, 1884).

MANSON, GEORGE (1850-76). A Scottish water-color painter and engraver, born in Edinburgh. He at first worked as an engraver, and during this time and afterward studied painting in the Edinburgh School of Art, and etching in 1875, under Cadart in Paris. His pictures are usually of homely rustic subjects, treated with much delicacy and beauty of color and form; such are "Devotion," "What is it?" and "Milking Time." He was fond of painting children. As an engraver, Manson imitated the simple, direct methods of the Bewicks. Consult Gray, *George Manson and his Works* (Edinburgh, 1880).

MANSON, SIR PATRICK (1844-1922). An English physician and parasitologist and writer on tropical diseases. He was born in Aberdeen, was educated there and in London, and first became known by his investigations into the pathology of filarial diseases. He was one of the first to suggest the hypothesis that the mosquito is an active agent in the propagation of malaria. He was dean of the College of Medicine for Chinese at Hongkong and for some years after 1897 was medical adviser to the British Colonial Office. He received many honors, including the K. C. M. G. in 1903 and the G. C. M. G. in 1912. In 1904 he investigated cachexial fevers, including kala azar (q.v.). Manson lectured on tropical medicine at the London School of Tropical Medicine and at the Charing Cross Hospital and Medical School, and was consulting physician to the British Seamen's Hospital. He published many monographs on tropical diseases. His most important works are *Filaria Sanguinis Hominis* (London, 1883) and *Tropical Diseases* (1898; 5th ed., rev., 1914). See INSECTS, PROPAGATION OF DISEASE BY.

MANSURAH, mǎn-sǒŕǎ. A town of Lower Egypt, capital of the Province of Dakahlieh, situated on the right bank of the Damietta arm of the Nile, about 35 miles southwest of Damietta, on the Cairo-Damietta Railway (Map: Egypt, C 1). It has extensive cotton manufactures and carries on a large trade in raw cotton. The town was founded in 1222 and is noted as the place where Louis IX of France was defeated and made prisoner in 1250. Pop., 1907, 40,279.

MANT, RICHARD (1776-1848). An Irish bishop. He was born at Southampton, England; was educated at Winchester School and Trinity College, Oxford, taking his bachelor's degree in 1797; was elected fellow of Oriel College in 1798; was ordained priest in 1803; and was curate and vicar of several parishes in and near London, 1804-20. He was made Bishop of Kilaloe and Kilfenoragh, Ireland, in 1820, and in 1823 was transferred to the see of Down and Connor, to which Dromore was added in 1842. Bishop Mant voted against Catholic emancipation in 1821 and 1825. In 1830 he was a member of the Royal Commission to inquire into ecclesiastical union. He was a prolific writer of poetry, as well as of historical and theological works; and some 20 of his hymns are found in many

hymnals. With George D'Oyly (q.v.) he prepared the annotated edition of the Bible known as D'Oyly and Mant's Bible (1814), which had an immense sale in England and was republished in New York, with additions by Bishop Hobart. He also published *The Book of Common Prayer with Notes* (1820) and a *History of the Church of Ireland from the Reformation to the Union of the Churches of England and Ireland in 1801* (1840). His poetical works include a version of the Psalms (1824) and *Ancient Hymns from the Roman Breviary, with Original Hymns* (1837). Consult the memoir by his son, Walter Bishop Mant (Dublin, 1857).

MANTA, mǎn'tǎ. A port of the Province of Manabí, Ecuador, situated on the Pacific coast, 150 miles west-southwest of Quito (Map: Ecuador, A 4). Its harbor is deep enough for large vessels. Among the ports of the country in 1911 it held second rank in imports and third in exports; the former having a value of \$22,629 and the latter \$25,734. It exports straw hats, rubber, and coffee, and is the seat of a United States consular agent. Manta is the chief port of the province, serving especially the inland towns of Monticristi and Portoviejo. It was founded in 1535. Pop. (est.), 2500.

MANTA (Sp., blanket). A name about Panama of the huge ray (*Manta birostris*), more commonly known as devilfish (q.v.) or sea devil, which is greatly dreaded by the pearl fishers, "whom it is said to devour after enveloping them in its vast wings," sometimes 20 feet across, as in a blanket. See Plate of RAYS AND SKATES.

MANTARO, mǎn-tǎrô. A river in Peru. It is formed at a height of 13,000 feet above sea level by the small head streams of Lake Chinchaycocha, in the western part of the Province of Junín. Thence it flows southeast past the towns of Jauja and Huancayo into the Province of Huancavelica, where it turns northeast, breaks through a deep gap in the eastern cordilleras, and joins the Apurímac to form the Ené, which joins the Quillabamba to form the Ucayalli. Its length is about 280 miles, and it is navigable a few miles above the junction.

MANTCHURIA, mǎn-chōŕi-ǎ. See MANCHURIA.

MANTEGAZZA, mǎn'tǎ-gǎ'tsǎ, PAOLO (1831-1910). An Italian physiologist and anthropologist, born at Monza. After studying medicine in the universities of Pisa and Milan, he received his doctor's degree at Pavia (1854), and then traveled extensively in Europe, India, and South America, where he practiced for a time in Paraguay and the Argentine Republic. In 1858 he returned to Milan, was appointed physician at the hospital in that city the following year, and became in 1860 professor of general pathology at Pavia. In 1870 he was made professor of anthropology at the Istituto di Studi Superiori in Florence, and there he founded the Museum of Anthropology and of Ethnology, the first in Italy, as well as the Italian Anthropological Society and a review, *Archivio d'Antropologia e d'Etnologia*. He was deputy for Monza in the Italian Parliament from 1865 until 1876, when he was appointed to the Senate. He was a prolific writer. His philosophical and medical works include: *La scienza e l'arte di guarire* (1859); *La generazione spontanea* (1864); *Elementi d'igiene* (1875); *Igiene dell'amore* (1878); *Fisiologia del dolore* (1880); *Fisiologia del piacere* (1881); *Fisionomia e mimica*

(1883); *Gli amori degli uomini: Saggio di una etnologia dell' amore* (1886); *Le estasi umane* (1887); *Fisiologia della donna* (1893); *Fisiologia dell' amore* (1896); *L' anno 3000* (1897); *L' amore* (1898). He also published travel sketches and political treatises: *Rio della Plata e Teneriffe* (1877); *Viaggio in Laponia* (1884); *India* (1884); *Studi sull' etnologia dell' India* (1886); *Ricordi d' un fantuccino al parlamento italiano* (1896); *Bibbia della speranza* (1905); and among his novels may be mentioned *Il dio ignoto* (1876).

MANTEGNA, mân-tă'nyă, ANDREA (1431-1506). An Italian painter and line engraver of the early Renaissance, the chief master of the Paduan school. He was born at Vicenza, the son of one Biagio (Blasius), who seems to have been a peasant. After the death of his father he removed to Padua, where he received his intellectual and artistic education. He was adopted by the painter Squarcione, whose apprentice and pupil he became. They disagreed repeatedly and finally separated, when Andrea came under the influence of Jacopo Bellini and espoused his daughter Nicolosia in 1453. It is the tendency of the latest criticism to minimize the influence of Squarcione upon Mantegna's art; nevertheless, it is certain that we find all the characteristics of Squarcione's school in it. He was also influenced by the work of Donatello and Pizzolo, his assistant, by Paolo Uccello, and by Fra Filippo Lippi at Padua. At the age of 17 Mantegna was an independent master, practicing his art at Padua, where he remained until the end of 1459.

The chief works of this early Paduan period are his seven mural paintings in the chapel of Sts. James and Christopher, in the church of the Eremitani, in which the entire progress of his art can be traced. Mantegna's paintings are far superior to those of the other pupils of Squarcione in the chapel and are as important for northern Italy as the Brancacci frescoes for Florence. Five are from the life of St. James and two from the life of St. Christopher. His earliest known work is a wall painting representing Sts. Bernardinus and Antonius (1452), above the main portal of San Antonio in Padua. Others are the fine polyptych of St. Luke in the Brera, Milan (1453-54), containing panels of saints in arched frames, the most prominent of whom is St. Luke; "St. Euphemia," in the Museum of Naples; the "Presentation of Christ in the Temple"; and the portrait of Cardinal Luigi Scarampi, in the Berlin Museum. The altarpiece of St. Zeno, Verona (1457-59), has rich classical decoration of columns and garlands; in the centre is the Madonna, surrounded by angels and by a group of saints on either side. The predella contained a "Crucifixion" of infinite pathos, now in the Louvre, which was flanked by "Gethsemane" and the "Resurrection," at present in the Museum of Tours.

In 1459, after repeated invitations from Lodovico Gonzaga, Marquis of Mantua, Mantegna removed to that city, where he resided for the remainder of his life. Here he participated in a sumptuous court life (designing pageants), decorated palaces, and painted portraits of his patrons. Although very independent and sometimes irritable, he was treated with high honor and great consideration by the Marquis and his successor, Francesco II, under whose patronage he continued until his death. He was granted a coat of arms, raised to knighthood, built him-

self an imposing dwelling, and gathered a fine collection of antiques. In 1483 Lorenzo de' Medici visited him, and in 1488 Pope Innocent VIII summoned him to Rome to decorate the Belvedere Chapel, now destroyed. In 1490 he returned to Mantua, where he died Sept. 13, 1506. His last years were darkened by financial troubles which caused the sale of some of his antiques, particularly a bust of Faustina to Isabella d' Este for 100 ducats. He left sufficient wealth, however, to provide for a fine family chapel in Sant' Andrea, in which he was interred. It contains a "Madonna with Saints" by his hand and frescoes after his designs by his two sons, Ludovico and Francesco, both mediocre painters.

His chief work at Mantua was the decoration of the Camera dei Sposi, the marriage chamber of Duke Gianfrancesco and Isabella d' Este, in the Castello di Corte, finished in 1474. Two of the walls and the ceiling remain. One of these, which is partially damaged, is covered with a realistic group of the Marquis, his wife, and the entire court. The other shows a meeting of the Marquis with Cardinal Francesco Gonzaga, both attended by relatives. The figures are nearly all in profile and stiff in action, but intensely realistic and of monumental grandeur. The same wall contains a hunting scene, somewhat damaged, and a group of beautiful genii holding an inscription. The ceiling is richly decorated and contains a circular dome painted to represent the open sky, with angels and other figures looking over a parapet. Before going to Rome, Mantegna had also begun his nine cartoons, the "Triumph of Cæsar," now in Hampton Court, which he finished soon after his return to Mantua. They are drawn on paper in high colors, to represent, as if in bas-relief, a continuous triumphal procession, and were used as hangings. No other monument of the fifteenth century shows such knowledge and feeling for the antique. For Isabella d' Este, Marchioness of Mantua, he painted two pictures in the famous chamber which she furnished with paintings by prominent Italian artists, viz., the "Triumph of Virtue over Vice" and "Parnassus," the latter containing groups of graceful classical figures in a romantic landscape. Both are now in the Louvre.

Among his other works painted at Mantua are a fine triptych in the Uffizi, with the "Adoration of the Kings," the "Circumcision," and the "Ascension"; "St. Sebastian," in the Gallery of Vienna; "St. George," in the Academy of Venice; "Summer," "Autumn," and the "Triumph of Scipio," in the National Gallery, London; and the "Dead Christ," in the Brera, Milan, a marvel of foreshortening and realistic ugliness. In later life he painted a large number of Madonnas, of which there are good examples in the Uffizi at Florence, the National Gallery, London, the Dresden Gallery, and the Trivulzio collection, Milan. Particularly famous is the "Madonna della Vittoria" (1496), painted in commemoration of a supposed victory over the French and now in the Louvre. Under a canopy of fruit and leaves the Virgin, surrounded by saints, is represented blessing Francesco Gonzaga. In the United States, Mantegna is represented in the Gardner collection, Boston, by the "Infancy of Jesus," an early work; in the Metropolitan Museum (Altman collection) by an admirable "Holy Family"; in the New York Historical Society by a "Crucifixion"; in the

Johnson collection, Philadelphia, by an "Adoration of the Magi"—the last three being late productions.

Reared in the classical atmosphere of Padua, whose university was the centre of classical learning, Mantegna was a highly cultured man, well versed in classical literature, and numbered among his friends prominent humanists, like Felice Feliciano, who dedicated a book to him. No other painter of the Renaissance understood antique art as did Mantegna. His paintings were its sculpture transferred to canvas, and he mastered completely its decoration. The figures and draperies are sharp and rigid, and his archæology is sometimes more learned than artistic. Yet he was a profound student of nature and an intense realist. His portraits are full of strength and character, his ideal figures noble and grand. No artist of the early Renaissance had greater invention and imagination. His execution was careful, his composition good, and the excellence of his drawing is attested by the finished drawings in the Louvre, British Museum, Uffizi, and other collections. As a colorist, he did not stand on the same high level, although his color, whether in bright or quiet harmonies, is at best very impressive. All of his work was in tempera, and his wall paintings, which were painted upon dry plaster, are improperly called frescoes. His influence on North Italian and Venetian painting was profound. He inspired Tura, and his works taught the later Venetians, above all Correggio.

Mantegna was the greatest line engraver of northern Italy, and his influence upon that art was potent not only in Italy, but in Germany as well. Unlike Italian engravers before him, he engraved copper plates from his own designs. At first his technique was primitive, but it improved with the study of German engravings. In all cases his invention is more interesting than his technique. The best-known plates of his Paduan period are the "Flagellation of Christ" and "Christ at the Gates of Hell"; to the Mantuan period belong the "Resurrection of Christ," "Deposition from the Cross," and "Entombment." This last plate had a greater influence upon art than any other ever executed. Its composition was adopted by Raphael in his picture of the same name, by Holbein (q.v.) in the "Basel Passion" series, and the figure of St. John was used by Dürer in his "Crucifixion." Mantegna also engraved a number of classical subjects, the best known of which are two Bacchanals, two "Battles of Tritons," and several plates from the "Triumph of Cæsar." He had a large number of followers who developed his technique and engraved his compositions, the best known of whom was Jacopo de' Barbari.

Bibliography. The sources for the life of Mantegna are chiefly his correspondence and other documents published by Baschet, "Documents sur Mantegna," in *Gazette des Beaux-Arts*, vol. xx (Paris, 1866), in the appendix to Kristeller's work, cited below. Vasari (q.v.) is unreliable upon Mantegna. The best modern authority is Paul Kristeller, *Andrea Mantegna*, translated by S. A. Strong (London, 1901), containing a bibliography, a work as scholarly as it is critical. Among other monographs that by Maud Crutwell, *Andrea Mantegna*, in "Great Masters in Painting and Sculpture" (ib., 1901), is a good brief account, while Julia Cartwright, *Mantegna and Francia*, in the "Great Artists Series" (ib., 1881), is of a popular character.

Other works on Mantegna are by Thode (Bielefeld, 1897); Yriarte (Paris, 1902); N. R. E. Bell, *Mantegna* (New York, 1911); also *Masters in Art*, vol. vi (Boston, 1905), containing an exhaustive bibliography; Fritz Knapp (ed.), "Andrea Mantegna," in *Des Meisters Gemälde und Kupferstiche* (Stuttgart, 1910). For his engravings, see Hind, in the *Connoisseur*, vols. xv, xvi (London, 1906), and the volume of the "Great Engravers Series" entitled *Mantegna* (ib., 1910).

MANTELETTA, män'te-lēt'ä. See **COSTUME**, **ECCLESIASTICAL**, and **Plate**.

MANTEL, or **MANTELPIECE**. The decorative composition which forms a frame and setting for a fireplace. Its name is derived from the wide projecting hood (*manteau* = mantle) which in the later Middle Ages served to gather and convey to the chimney flue behind it the smoke of the fire on the hearth. When, first in France and later in England, the fireplace formed in the masonry of the wall itself or of a chimney breast took the place of the primitive fire on the open hearth, the hood lost its importance and the mantelpiece became one of the chief features of interior decorative architecture, employing sculpture as an adjunct to architecture with great effect. Famous Renaissance examples are in the Doge's Palace, Venice; the Musée Cluny, Paris; the Château of Blois; and others, especially of the Jacobean period, in English manor houses. In the eighteenth century a huge mirror in an ornate gilt frame became in France the universal and dominant feature of the mantelpiece above its shelf, while in England carved wooden mantelpieces, or designs of stone below, with woodwork above framing a picture or mirror, became common. The refined beauty of many American Colonial mantelpieces of painted woodwork is well known. Modern designers employ brick and terra cotta, as well as stone, marble, and wood, in mantelpieces of the greatest variety.

MAN'TELL, GIDEON ALGERNON (1790-1852). A British geologist, born at Lewes in Sussex. He studied and practiced medicine and surgery, in which he was successful, but devoted himself chiefly to geology and paleontology. His excellent collection of fossils was bought by the British Museum. He investigated the fossils of the Wealden formations and discovered four of the five genera of dinosaurs known at the time of his death. He was elected F.R.S. in 1825. He wrote a large number of books, memoirs, and papers, many of the papers being published in the *Philosophical Transactions* and the *Geological Transactions*. Among his books were *The Wonders of Geology* (1838) and *The Medals of Creation* (1844).

MANTELL, ROBERT BRUCE (1854-). An American actor, born at Irvine, Ayrshire, Scotland. His parents intended him for the law, but he made so little progress in his studies that they decided on a commercial career for him, and he was apprenticed to a wine merchant. During his apprenticeship he happened to take part in some amateur theatrical performances, and meeting with unexpected success, he developed a desire to become an actor. His parents opposed him in this, and at the age of 20 he left home and took passage for Boston. Failing to obtain an engagement there, he returned to England in two weeks, where he joined a company under the management of Richard Edgar and made his début Oct. 21, 1876, at Rochdale, Lan-

cashire, as the sergeant in *Arrah-na-Pogue*. His next important rôle was Father Doolan in *The Shaughran*. He then toured the provinces with Charles Matthews, Barry Sullivan, and Dion Boucicault till 1878, when he returned to America and played juvenile rôles in the company of Modjeska. His first appearance in London was in July, 1880, at Saddlers Wells Theatre. He visited America again in 1882, touring the country in *Romany Rye*, in which he appeared as Jack Hearn. In 1883 he played Boris Ispanoff in *Fédora* with Fanny Davenport. Later he became a star and appeared with his own company in a large repertoire of classic and romantic plays, including *Hamlet*, *Richard III*, *Othello*, *Macbeth*, *Romeo and Juliet*, *Corsican Brothers*, *Lady of Lyons*, and *Richelieu*. In later years he confined himself almost exclusively to Shakespearean rôles. He appeared in New York in revivals of *King Lear* and *Macbeth* in 1905 and in 1911, and in 1915, with his wife, had a successful season there in repertoire. William Winter (q.v.) paid high tribute to Mantell's ability. He came to be known for consistently sincere and intelligent work and for adequate productions.

MANTES, mânt. A town in the Department of Seine-et-Oise, France, beautifully situated on the left bank of the Seine, 30 miles west-northwest of Paris by rail (Map: France, N., G 4). A twelfth-century bridge crosses the Seine above the town, and modern bridges connect Mantes with an islet in the Seine and with Limay on the opposite river bank. The fine Gothic church of Notre Dame, dating from the twelfth century, occupies the site of the prior church burned during the siege of 1087; other buildings include the town hall, library, and palace of justice. Mantes has large tanneries, manufactures musical instruments and saltpetre, and has a considerable agricultural trade. Mantes was a Celtic town from which Julius Cæsar expelled the Druids; it is the Roman Medunta. William the Conqueror destroyed the town in 1087 and here received the injury which caused his death. Pop. (commune), 1901, 8034; 1911, 8821.

MANTEUFFEL, män'toi-fel, EDWIN HANS KARL, BARON VON (1809-85). A Prussian general. He was born at Dresden, entered the army in 1827, and became an officer a year later. He became in 1843 the personal aid of Prince Albrecht and in 1848 of King Frederick William IV. His promotion was rapid, and he played a prominent rôle in the great Prussian military reforms. He was a lieutenant general in the War of 1864 against Denmark, and in 1865 became the Governor of Schleswig and as such played a prominent rôle in the ultimate solution of the Schleswig-Holstein question. During the War of 1866 against Austria he commanded the Army of the Main, and during the Franco-Prussian War he commanded the First Army Corps and participated in the battles of Colombey-Nouilly and Noisseville. Later he became the commander in chief of the German troops in south France and operated effectively there, driving Bourbaki's army across the Swiss frontier. After the close of the war he was made commander in chief of the German army of occupation and was decorated with the Iron Cross and the Black Eagle. In 1873 he was created field marshal and later sent on important diplomatic missions to Russia. His last prominent post was that of Governor of the Imperial Province of Alsace-Lorraine.

MANTEUFFEL, OTTO THEODOR, BARON VON

(1805-82). A German statesman, born at Lübben. He studied jurisprudence and political science at Halle and became in 1845-46 a director of one of the departments in the Prussian Ministry of the Interior. When Count Brandenburg undertook the suppression of the revolutionary movement of 1848, he was appointed Minister of the Interior. In 1850, at the death of Count Brandenburg, he took office as Minister of Foreign Affairs and president of the cabinet and as such pursued a reactionary policy. In 1856 he was sent as Plenipotentiary to the Congress of Paris and in 1858 retired from the ministry. After 1864 he was a member of the Prussian House of Lords. From his literary bequest H. von Poschinger published *Unter Friedrich Wilhelm IV. Denkwürdigkeiten des Ministers Otto Freiherrn von Manteuffel* (Berlin, 1901) and *Preussens auswärtige Politik, 1850-58* (ib., 1902). For his biography, consult Heseckel (Berlin, 1851), and *Allgemeine deutsche Biographie*, vol. xx (Leipzig, 1884).

MANTI, män'ti. A city and the county seat of Sanpete Co., Utah, 126 miles by rail south of Salt Lake City, on the Denver and Rio Grande Railroad (Map: Utah, C 3). The Mormon temple which cost about \$2,500,000 is a noteworthy feature of the city, and there are two fine public school buildings, a public library, Manti Cañon, and municipally owned water works and electric-light plant. Manti is surrounded by a productive agricultural country, largely engaged also in sheep and cattle raising, and has flour mills, a candy factory, saw mills, stone quarries, and a creamery. In the vicinity are productive coal mines. Manti was settled in 1849 and incorporated two years later. The city was greatly damaged on several occasions by cañon floods, but by a system of patrol and regulation of various sections of the watershed this devastation has been stopped entirely. Pop., 1900, 2408; 1910, 2423.

MANTINEA. See MANTINEIA.

MAN'TINE'IA, or **MANTINEA** (Lat., from Gk. *Μαντineia*, *Mantineia*). A city of Arcadia, in the Peloponnesus, on the high table-land west of Argolis (Map: Greece, Ancient, C 3). It was on the river Ophis, in a broad plain, and was at first a group of open villages, owning the supremacy of Sparta. Shortly after the Persian wars, under Argive influence the five villages united in a fortified city, which gained great military strength. Through its efforts to control the watershed of the river Alpheus (q.v.) and the two highways which led from Arcadia to the Isthmus of Corinth, it frequently came into collision with Sparta; in these struggles the city sought help from Argos. Mantinea fought frequently with Tegea (q.v.). The community was dissolved later by the Spartans, in 385 B.C., only to be reconstituted by the Thebans under Epaminondas after the battle of Leuctra. The plain in which Mantinea stood, from its strategic importance, was the scene of several battles, of which the most famous was that of 362 B.C., when Epaminondas defeated the Spartans and Athenians, but fell himself in the moment of victory. Later, Mantinea became less important than Megalopolis (q.v.). For a time the city belonged to the Achaean League (see *ΑΧΑΪΑ*), but in 222, having deserted the League, it was laid waste. Excavations conducted by the French School at Athens during 1887 and 1888 have clearly determined the course of the walls of Mantinea and laid bare the Agora and its surrounding

buildings, including a small theatre, interesting because built up from the level plain instead of being laid, in the usual Greek fashion, against a hillside. The site of the city is now called Palæopoli. Consult: Fougères, *Bulletin de correspondance hellénique* (Paris, 1890); id., *Mantinee et l'Arcadie orientale* (ib., 1898); J. Kromayer, *Antike Schlachtfelder in Griechenland* (Berlin, 1903); D. Worenka, *Mantineia* (1905); Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909).

MANTIQUEIRA, mǎn'tê-kǎ'ê-rá, SERRA DA. A mountain range in southeast Brazil. It extends for about 200 miles parallel with the Atlantic coast and about 70 miles away from it, first along the boundary between the states of São Paulo and Minas Geraes, and then for a short distance into the latter, where it divides into two branches, the Serra dos Aimores continuing along the coast, and the Serra do Espinhaço extending through the centre of Minas Geraes. The name Mantiqueira is sometimes applied to this whole system, but is properly confined to the single range in the south. It is granitic in character, and the highest and roughest in Brazil. Its highest point, Mount Itatiaia, on the state boundary, has an altitude of 9739 feet. The range is the watershed of the Rio Grande, the principal head stream of the Paraná.

MANTIS (Neo-Lat., from Gk. *mantis*, diviner, prophet; so called from the position of the forelegs, which resembles the attitude of prayer). One of the popular names for any of the orthopterous insects of the family Mantidae and the scientific name of the type genus. Other popular names are praying insect, soothsayer, prophet, rear-horse, mule killer. The family

species is the rear-horse or mule killer (*Stagmomantis carolina*), but the European (*Mantis religiosa*) has been introduced into the United States by accident and has become acclimatized. The eggs of the Mantidae are laid in tough cases attached to the twigs of trees, where the young, when hatched, begin immediately to feed upon plant lice or other small soft-bodied insects, the size of the insects attacked increasing with the growth of the mantes. They have always been recognized as beneficial insects, but they are indiscriminate in their diet and will feed upon other beneficial insects as well as upon injurious forms. Their eggs are frequently parasitized by a very curious chalcid fly of the genus *Podagrion*, which by means of a long ovipositor is enabled to pierce the tough egg cases of the mantes.

These insects seem always to have been regarded with superstitious awe. They were used by the Greeks in soothsaying, and the Hindus display a reverential consideration of their movements and flight. In southern France the peasants believe that they point out a lost way; the Turks and other Moslems recognize intelligence and pious intentions in the actions of the mantis; a South African species is, or was, venerated by the Hottentots; the Chinese and the Javanese keep them in cages and cause them to fight for wagers.

MANTIS'SA. See LOGARITHMS.

MANTIS SHRIMP, or SEA MANTIS. A large burrowing crustacean (*Squilla empusa*), of the order Stomatopoda, which lives in large irregular holes which it excavates at or near low-water mark of spring tides. It is so called from the resemblance of the great spiny claw to that of the mantis (q.v.). This claw is borne on the legs of the second pair, and instead of ending in a forceps-like claw, which is armed with a row of six sharp curved spines fitting into corresponding sockets, the terminal joint is turned back and is attached to the penultimate segment like the blade of a pocket knife to the handle. By means of these singular organs, says Verrill, the shrimps hold their prey securely and can give a severe wound to the human hand, if handled incautiously. It has large eyes, but, as it remains in its burrow constantly, it is blind, the facets of the eye being partly atrophied. It lives chiefly on annelid worms. The European species is used as food, and the American species is probably edible.

MANTLE (AS. *mantel*, OF. *mantel*, Fr. *manteau*, It. *mantello*, Lat. *mantellum*). A long sleeveless cloak, worn in the Middle Ages over the armor and fastened by a fibula in front or at the right shoulder. The mantle was an important part of the official insignia of various orders of knighthood. Ladies wore mantles, often decorated with heraldic charges and bearing either the impaled arms of the lady and her husband or the husband's arms only. The Teutonic or White Knights were known as the *ordo alborum mantellorum* (order of white mantles) because of their white cloaks, and the robe of office worn by the electors of the Holy Roman Empire was called the electoral mantle. The name is still given to the robes of state of kings, peers, and knights.

MANTLING, LAMBREQUIN, or CONTOISE. A heraldic ornament attached to the helmet. Sometimes it is cut into irregular strips and curls of the most capricious forms, supposed to indicate that it has been torn on the field of battle; but usually the strips fall in graceful,

THE REAR-HORSE.

a, adult male *Stagmomantis carolina*; b, egg case.

Mantidae form the old group of the Orthoptera known as the Raptoria or graspers. They have the prothorax long and the front legs fitted for grasping their prey. The head is oblique and generally three-cornered. They are much more abundant in tropical regions than elsewhere and exhibit striking instances of protective resemblance and aggressive resemblance. The so-called "flower mantes" of tropical countries resemble the flowers of certain plants, and in these flowers they lurk awaiting the visits of the insects upon which they feed. The term "praying insects" has been derived from the attitude which they assume when at rest or when waiting to grasp another insect; the knees are bent and the front legs are held as though supporting a prayer book. The commonest North American

flowing lines. In British heraldry the mantling of the sovereign is of gold lined with ermine; that of peers, ordinarily of crimson velvet lined with ermine; but sometimes the livery colors (see LIVERY) are adopted instead, as is generally the practice in continental heraldry. This kind of mantling, being inseparable from the helmet, cannot be used by ladies. See HERALDRY.

MANTRAS, mǎn'tráz. A people of the territory of Malacca and Rembau, formerly regarded as a Negrito people of the Malay Peninsula, but more recently described as Sakai-Malay half-breeds. The mixture of these peoples has resulted in giving the Mantras a somewhat taller stature than the Sakai and a whiter skin.

MAN-TSE. See MANS.

MANTUA, mǎn'tú-à (It. *Mantova*). A fortified city of Lombardy, Italy, situated on the Mincio, 25 miles by rail southwest of Verona and 100 miles southwest of Milan (Map: Italy, C 2). It was formerly the capital of the Duchy of Mantua and is now the capital of the province of the same name. It is the see of a bishop and the centre of a military district. It occupies two islands in the river and is elaborately fortified. Three lakes formed by the river half surround the town and there are marshes adjacent. It is not a healthful city. Architecturally it is interesting on account of the Renaissance churches and secular edifices, especially the church of Sant' Andrea, built towards the close of the fifteenth century after plans by Leon Battista Alberti (q.v.), also the chapel of San Sebastiano by Alberti. The old Ducal Palace, built 1302-28, is one of the largest of its kind in Europe. It is still more prominent in the world of painting, owing to the works of Mantegna and Giulio Romano, both of whom resided here. The inadequate population and the sullen massive grandeur of the edifices explain why the traveler in Mantua associates the city with a gloomy decadence. The streets are regular and spacious, but poorly paved. There are several fine squares. The spacious Sant' Andrea has been subjected to many changes during the centuries. Its white façade of marble is adorned with a portico and contrasts curiously with the adjacent red brick campanile. The interior (110 yards long) contains many frescoes by prominent artists. The cathedral of San Pietro is not attractive, but has a fine ceiling.

The Corte Reale, formerly the Ducal Palace of the Gonzagas and now consigned to military purposes, is a notable structure dating from the beginning of the fourteenth century. It was embellished with frescoes by Giulio Romano. Its apartments are of exceptional interest for their varied decorations, representing the most delightful Italian period of the art of interior ornamentation. Another fine old Mantuan palace is the Palazzo del Tè, constructed by Giulio Romano and adorned by him in a most artistic style. Some of the frescoes are excellent. The friezes in the loggia are by Primaticcio, who was educated in Mantua under Giulio Romano. In the old castle of the Gonzagas is a collection of archives. Among the frescoes here by Mantegna only two remain in a satisfactory condition. The Vergilian Academy of Arts and Sciences contains some specimens of art. The neighboring library in the Lyceum has a work by Rubens, who lived and studied in Mantua several years. In the adjacent museum are some good Greek busts and sarcophagi, and the Museo Partio possesses other antiquities. A

statue of Dante and the house of Giulio Romano are shown as attractions to the visitor in Mantua. It was formerly an important military post, but owing to the swampy nature of the surrounding area was maintained with difficulty. The city has a theological institute, a botanical garden, an astronomical observatory, a public library with 75,000 volumes, founded in 1780 by Maria Theresa, and an excellent, commodious military hospital. The modern sections of the city have ironworks, oil and flour mills, tanneries, breweries, toy factories, etc. Pop. (com-mune), 1901, 29,142; 1911, 32,657.

History. Mantua was originally an Etruscan city. It became a Roman municipium just before the time of Vergil, who was born in the neighboring region of Andes, but very near to the town. In the sixth and seventh centuries the town was occupied by the Lombards. In the ninth century it was in the hands of the Church. The town rose to importance in the twelfth century, when it became one of the city republics and a member of the Lombard League. Towards the close of the thirteenth century began the rule of the house of Bonaccolsi, which was succeeded in 1328 by the house of Gonzaga. A century later Mantua with its territory was erected into a marquisate, and in 1530 the Gonzagas became dukes of Mantua. The state prospered greatly under this dynasty, its political power and territory being increased at the expense of Venice and Milan. The Gonzagas were liberal patrons of the arts and learning. After the Mantuan War of Succession (1628-30) the city began to decline. The last Duke was driven away in 1703 and died in 1708 and Mantua fell to Austria. The French took the city in 1797, but lost it again in 1799. The Treaty of Lunéville (1801) restored it to the French, who held it until 1814. The Austrians then held it until 1866, when it was ceded to Italy. During the Austrian occupation it was of great military importance and constituted one of the so-called quadrilateral of fortresses, the others being Verona, Legnago, and Peschiera. See GONZAGA, HOUSE OF.

MANTUAN (mǎn'tú-an) **BARD**, **MANTUAN SWAN**. Titles applied to Vergil in allusion to his birthplace, Mantua.

MANU, mǎ'nōō (from Skt. *manu*, man). An ancient mythical sage of India, the progenitor of mankind, according to the Hindus, and the reputed author of the great law book known as the Code of Manu (Skt. *Mānava-Dharma-Sāstra*).

There is no good ground for accepting the existence of Manu as a historical personage. In the *Rig-Veda* he is merely the ancestor of the human race, the first one to offer a sacrifice to the gods. In the *Satapatha Brahmana* and in the *Mahābhārata* he alone survives the universal deluge. In the first chapter of the law book ascribed to him he declares himself to have been produced by Viraj, who was an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age.

The *Mānava-Dharma-Sāstra*, written in verse, is a collection of religious ordinances, customs, and traditions, such as would naturally grow up by established usage and receive divine sanction in course of time. This work is not a mere law book in the European sense of the word; it is

likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and treats of the state of the soul after death. In short, it is the religious, secular, and spiritual code of Brahmanism. It is divided into 12 books. The chief topics are the following: (1) creation; (2) education and the duties of a pupil, or the first order; (3) marriage and the duties of a householder, or the second order; (4) means of subsistence, and personal morality; (5) diet, purification, and the duties of women; (6) the duties of an anchorite and an ascetic, or the duties of the third and fourth orders; (7) government, and the duties of a king and the military caste; (8) judicature and law, private and criminal; (9) continuation of the former, and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude.

This Code of Manu, not improbably based on a *Mānava Dharma Sūtra*, is closely connected with the *Mahābhārata* (q.v.), of which three books alone (iii, xii, xvi) contain as many as 260 of its 2684 slokas. It probably assumed its present form not much later than 200 A.D.

Bibliography. The text of Manu has often been edited and translated, as by Mandlik, with seven native commentaries (Bombay, 1886); Julius Jolly, *Mānava-Dharma-Sūtra* (London, 1887); in the series of the *Nirnaya Sagara* Press (Bombay, 1887); and better, with Kulūka's commentary (ib., 1888). There are several translations, especially by Bühler, *The Laws of Manu* (Oxford, 1886), and by Burnell and Hopkins, *The Ordinances of Manu* (London, 1884, 1891). Consult also: E. W. Hopkins, *Mutual Relations of the Four Castes According to the Mānavadharmasāstra* (Leipzig, 1881); the French translation of Strehly (Paris, 1893); Beaman, *On the Sources of the Dharmasāstras of Manu and Yājñavalkya* (Leipzig, 1895); Julius Jolly, *Recht und Sitte* (Strassburg, 1896); S. V. Ketkar, *History of Caste in India: Evidence of the Laws of Manu in the Social Conditions in India during the Third Century* (2 vols., Ithaca, N. Y., 1909-11); A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

MANUA (mā-nū'ā) **ISLANDS.** See SAMOAN ISLANDS.

MANUAL (Lat. *manualis*, relating to the hand, from *manus*, hand). The keyboard of an organ played by the hands, in contradistinction to the pedal, played by the feet. The number of manuals varies from two to four according to the size of the organ. In older French organs even five manuals are found. The names of the different manuals are: (1) great organ; (2) choir manual; (3) swell manual; (4) solo manual; (5) echo manual. Each manual really is a separate organ in itself, having its own set of pipes and stops. By means of couplers any or all of the manuals can be connected, so that by striking a note on one manual the same note sounds on all the other manuals that are coupled. The usual compass of manuals is four octaves and a fifth, C-g².

MANUAL OF ARMS. The rules and explanations for the instruction of military recruits in the use of their arms and their care and preservation. They are part of the course of instruction given the soldier in the school of the soldier, which in turn is one of the several distinct courses of training included in the

manual known as drill regulations (q.v.). The manual of arms owed much of its former elaborateness, both in the United States and England, to its German origin. In this connection it is interesting to note that the exercises in all three countries have been reduced in number and simplified. In the United States army all drills are prefaced and concluded with an examination of cartridge chambers, as a precaution against accidents, and for purposes of instruction the movements are divided into motions and executed in detail. The command of execution determines the prompt execution of the first motion, and the commands *Two*, *Three*, etc., the other motions. The commands and movements of the manual of arms are given after the soldier is in position with rifle at the *order*, and are as follows: (1) order arms; (2) present arms; (3) right shoulder arms; (4) port arms. Other movements are: (5) parade rest; (6) fix bayonets; (7) charge bayonets; (8) trail arms; (9) rifle salute; (10) inspection arms.

MANUAL TRAINING. This term, in spite of considerable criticism, has come to be generally applied to the use of constructive handwork in the schools, as a feature of general education. The term is broadly used to include the work of both boys and girls in various materials, in which case instruction in domestic arts and science is understood; but it is often used in a narrower sense as relating only to the work with tools commonly given to boys. The chief grounds of objection to the use of the term are that it emphasizes discipline rather than content. There is a tendency at present to use the term "hand-work" or "handicrafts" for the actual constructive work and to introduce a new group of content subjects, which furnish information about industries in general, under the name of industrial arts. The two branches are intended to supplement each other, with the result that the type of constructive work is enriched and varied. The aim in general is not only to provide some acquaintance with industrial organization of the world, but also to afford boys and girls about to leave school some basis for selecting their future occupations. To this extent such courses are also prevocational.

The earliest official recognition of manual training as a legitimate part of school work was obtained in European countries. As early as 1858, Uno Cygnæus organized a plan of manual training for the primary schools of Finland, and in 1866 instruction in some branch of manual work was made compulsory in the training colleges for male teachers in that country and in all primary schools for boys in country districts. Sweden is, however, the country which contributed most towards the early development of manual training and from which has come the largest influence in its propagation. In 1872 the government reached the conclusion that schools for instruction in Sloyd were necessary to counteract the tendency towards concentration in cities and the decline of the old home industries. The schools first established had naturally an economic rather than an educational significance. This was changed, however, as the movement grew, until a thoroughly organized scheme of educational tool work for boys between 12 and 15 years of age was developed. In 1877 the work was introduced into the folk school, and the government granted aid in support of the instruction. The Sloyd Seminarium at Nääs, established in 1874 under the

direction of Otto Saloman, was not only an active and stimulating force in the development of the work in Sweden, but exercised a far-reaching influence upon the thought and practice of other countries. At present Sloyd is taught in all the regular normal schools of the country.

In France manual training was made obligatory in the elementary primary schools by the Law of 1882. The official programme for manual training is very complete and thorough, but its provisions are only partially realized because of the failure of communes to provide workshops and of the insufficient supply of trained teachers. In Paris about 200 schools were equipped with workshops in 1914, and at this time more than one-third of the regular teachers in the city schools had taken normal courses in manual training. A feature of the French work is the variety of materials and processes used and the fact that handwork instruction has been planned for every grade of the elementary primary school. The tendency here is to associate handwork with drawing and mathematics more closely than is done in other countries.

Germany, although the seat of a very active propaganda issuing from the German Association for Manual Training for Boys, has done very little towards incorporating manual training with the regular work of the common schools. A large number of workshops have been established in various parts of the Empire, supported mainly by individuals and societies, in which pupils of the public schools are given instruction out of school hours. The educational ministries of Prussia, Saxony, and Baden make annual contributions in aid of this instruction, but the work is obligatory in only a very few places. Manual work for girls, on the other hand, has been for a long time a compulsory branch of instruction in the common schools of Germany. The Manual Training Seminary at Leipzig, founded in 1887 by the Association for Manual Training for Boys, under the leadership of Dr. Waldemar Götze, is the active centre of the movement and the main institution for the training of teachers.

In England handwork received but little official encouragement until quite recently. It was taught here and there in elementary schools, but on no organized basis. The need of manual training was pointed out by the Royal Commission on Technical Education in 1882 and again in 1884, after it had met with success in Manchester and Sheffield. In 1890 it appeared in the code for elementary schools "as recognized for attendance purposes," and grants were paid for the subject by the Department of Science and Art from 1891 to 1898. The subject was taught and is still taught frequently in centres used by a number of schools; the instructors were often skilled craftsmen, but the tendency now is to give regular teachers training in handwork in special and summer courses. So far as aim is concerned, the movement has been from an emphasis on hand and eye training and the subject for its own sake to the present emphasis on handwork as a method of expression with possibilities of application to geography, nature study, history, arithmetic, and geometry. Handwork is now found generally in all classes of the elementary schools from the constructive work of the infant schools through the light woodwork in the middle stages to the manual training of the older pupils. The media used are clay, plasticine, paper, string, wire, cardboard,

prepared wood, wood, and metal. In the secondary schools comparatively little attention has been given to manual training, which was for long regarded as an extra and was not infrequently taught by the school janitor or carpenter or any other person able to handle tools.

The history of manual training in the United States involves both the development of the idea and the development of practice. In the field of practice, little of a purely educational character appeared before 1878, at which time the Workingman's School was founded by the Ethical Culture Society of New York. This institution comprised a kindergarten and an elementary school, in which manual work formed from the first a vital and important part of the educational scheme. The general movement, however, took its large beginning, as has been the case with so many educational movements, at the top instead of the bottom of the school system. In 1880, through the efforts of Dr. Calvin A. Woodward, the St. Louis Manual Training School was opened in connection with Washington University. The work of this school attracted wide attention, and its success led to the speedy organization of similar schools in other large cities: Chicago, Baltimore, and Toledo, 1884; Philadelphia, 1885; Cleveland, Cincinnati, and Omaha, 1886. The first provision for girls' work in these schools was made in the case of the Toledo school and included sewing, dressmaking, millinery, and cooking. In 1895 the Massachusetts Legislature, under the lead of the State Board of Education, made it obligatory upon every city in the State of 30,000 or more inhabitants to establish and maintain manual training in a high school.

The rapid development of this type of secondary school resulted in the establishment of an institution peculiarly American. In other countries the introduction and spread of manual training has been confined to the elementary school, and no institution exists in Europe, of a purely educational character, that presents any parallel to the comprehensive and costly equipment of these schools. The shopwork comprised joinery, turning, pattern making, forging, and machine work, and sometimes foundry practice and tinsmithing. The nature of this work was very similar in the various schools, and until late years has been almost uniformly based upon the principles of the Russian System. The central idea of this system of shopwork instruction, developed in a technical school for the instruction of engineers, is the analysis of a craft into its elementary processes and constructions, and the presentation of these details in an orderly and sequential scheme as separate elements. This type of manual-training high school tended to become formal and scholastic and gradually lost its distinctive character. It has in recent years begun to be replaced by industrial or technical schools providing some definite vocational training, but the new type in turn is only in process of reorganization. In place of work that has been called "abstract, isolated, impractical, and unsocial in character," courses have been established in Cincinnati and Fitchburg which involve work under actual labor conditions, the students working for part time in school and part time in the shop. (See TECHNICAL EDUCATION.) Compared with the development of manual training in the high school, the introduction of the work in the public elementary school came at first but slowly. Experi-

mental classes in carpentry, the expense for which was borne by Mrs. Quincy A. Shaw, were conducted at the Dwight School in Boston in 1882. These were taken under the care of the city and transferred to temporary quarters in the English High School building in 1884, but the work did not receive a place in the course of study until 1888. In Springfield, Mass., sewing was introduced in the schools in 1884 and in 1886 a manual training school was established, at which pupils coming voluntarily from the elementary schools received instruction in knife work. In 1885 the Legislature of New Jersey passed a law providing that the State would duplicate any amount between \$500 and \$5000 raised by a city or town for instruction in manual training. This led to the early introduction of the work in a number of places in various parts of the State. In 1888 the city of New York began the introduction of a manual-training course of study, including drawing, sewing, cooking, and woodwork.

All this early work was crude and experimental, and it was not until the influence emanating from the Sloyd School of Boston began to be felt that tool work for boys in the elementary school took on a more definite character. A vital principle of the Sloyd work is the appeal to the interest of the worker through the construction of a finished object of definite use related, generally, to the needs of home life. This principle has gained general acceptance in the work of the elementary school and has to quite an extent modified the character of the work done in the high schools. From the upper grade of the grammar school with the provisions for shopwork for boys, and cooking and sewing for girls, handwork has made considerable progress in its way downward. Work in clay, paper, cardboard, sewing, weaving, basketry, bent iron, and simple wood construction are the processes most commonly employed. The aim has ceased to be one of purely disciplinary character; instead handwork is provided in the elementary schools to give practical expression and interpretation in concrete fashion to the bookwork of the classroom. Through it the pupil may be introduced to the social and industrial occupations of his environment; he may gain some idea of the development of industries or facility in giving concrete expression to an idea. As was mentioned earlier, the present phase aims to give a general acquaintance with the industrial organization of the world and to provide opportunities for selection of a vocation. At Gary, Ind., an experiment has been conducted which attracted considerable attention. Here, after the general preparatory handwork of the lower grades, the older pupils are given opportunities to learn and participate in those occupations necessary for equipping and repairing the school, which are going on all the year round. The pupils are practically apprentices to the expert workmen, who are selected for character, skill, intelligence, and teaching ability. In this way the pupils are trained not merely in exercises, but on genuine and real jobs, and come into contact with the work of carpenters, cabinetmakers, painters, plumbers, metal workers, engineers, electricians, printers, etc. In this way they may learn something about the different industries and try out their skill and inclinations in each until they are ready to select a vocation.

MANU'CHE, or **MANUCCI**, mā-nōō'chē, Cosmo. An English dramatist, probably of the Florentine family of the Mannucci, originally. It appears that he was aided in his literary endeavors by James Compton, Earl of Northampton, of whose retinue he was a member. During the civil wars he was successively captain and major of infantry, and afterward he busied himself in the instructing of private pupils and the writing of plays. His poverty was somewhat relieved by application first to Cromwell and afterward to Charles II. Twelve plays, nine in manuscript and three printed, are generally ascribed to him. There is no evidence that any was presented. One, *The Just General* (1652), described as a "tragi-comedy," and considerable portions of others are written in a peculiar rhythmical blank verse, scarcely different from prose. Consult: Charles Lamb, *Specimens of the English Dramatic Poets* (London, 1808, and subsequent editions); F. G. Fleay, *A Biographical Chronicle of the English Drama, 1559-1642* (ib., 1891); Sidney Lee, in *Dictionary of National Biography*, first supplement, vol. iii (ib., 1901).

MAN'UCODE (Malay *Manukdevata*, bird of the gods). The name originally given to the king bird of paradise, but now applied to certain Papuan birds probably not relatives of the *Paradisæidæ* at all. They have glossy, steel-blue plumage and are remarkable for their vocal powers. Lesson, Forbes, and other ornithologists assert that they are able to pass through every note of the gamut. Eight or 10 species are known, of which *Manucodia viridis* is common throughout the entire Papuan region. It is described by Wallace as being powerful and active, clinging to the smaller branches of the trees on which it finds the fruit that constitutes its food. See *BIRD OF PARADISE*.

MANUEL (mān'ū-ēl) **I, COMNE'NUS** (c.1120-80). Byzantine Emperor from 1143 to 1180. He was the youngest son of the Emperor

John II, or Calo-Johannes, whom he succeeded upon the throne. He became at once involved in an uninterrupted series of wars in Asia and Europe. In 1144 Raymond, Prince of Antioch, who had thrown off the Byzantine yoke, was compelled to submit again to vassalage. In 1147 the Crusaders, under Louis VII of France and Conrad III of Germany, marched through Manuel's dominions without serious hindrance on his part, as he was at this time entangled in a war with Roger, King of Sicily. This conflict proved a long and arduous one. For a time the Byzantine arms were victorious, but the fortune of war changed and no substantial gain resulted. Manuel was engaged in protracted wars with the Seljuks, who in 1176 defeated his forces in a great battle at Myriocephalon. He aided the enemies of Frederick Barbarossa in Italy. He also waged war with the Hungarians and with the Venetians, being unsuccessful against the latter. He died Sept. 24, 1180. The reign of Manuel was one of great splendor, but the expenses of the numerous wars and his policy of allowing the Italians special privileges in trade sapped the strength of the Empire. Consult: G. L. F. Tafel, *Komnenen und Normannen* (2d ed., Stuttgart, 1870); George Finlay, *History of Greece*, vol. iii (London, 1877); Hans von Kap-Herr, *Abendländische Politik Kaiser Manuels* (Strassburg, 1881); Ferdinand Chalandon, *Les Comnènes*, vol. ii (Paris, 1912).

MANUEL II, PALÆOLOGUS (c.1350-1425). Byzantine Emperor from 1391 to 1425. He succeeded his father, John V, as sole ruler after he had been an associate in the Empire since 1374. Fearing that Constantinople would fall into the hands of the Turks, Manuel applied for aid to the western princes, whose army was defeated with great slaughter by Bajazet (q.v.) at Nicopolis, in 1396. In 1398 a nephew of Manuel for the aid of Bajazet rose in rebellion, and the Emperor was compelled to make him co-Emperor. He was known as John VII. Manuel was in constant peril until Bajazet was defeated by Timur at Angora, in 1402, and taken prisoner. After the death of Bajazet in 1403 Manuel reigned in peace for 18 years, for the young Sultan Mohammed I was his intimate friend. But when in 1421 Mohammed died and Amurath II came to the throne, the old contest was renewed. In 1422 Constantinople was besieged, and although the siege failed, Manuel had to sign a humiliating treaty. He retired to a monastery in 1423, after a severe illness, his son John VIII becoming practically the sole ruler. Manuel died in 1425. He was the author of several theological treatises. Consult: Xivrey, "Sur la vie et les ouvrages de l'empereur Manuel Paléologue," in *Mémoires de l'Académie des Inscriptions*, vol. xix (Paris, 1853); Karl Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897); Edwin Pears, *Destruction of the Greek Empire* (London, 1903).

MANUEL I, THE FORTUNATE (1469-1521). A King of Portugal, in whose reign that country attained the highest pitch of power and splendor. He succeeded John II in 1495, ruled throughout with the help of the Cortes, and did much for art and letters by his generous patronage. The only blot on his domestic administration was his persecution of the Jews. And yet, as evidence that he had some liberal leanings even in religious matters, we have the fact that he secured from the Pope authorization for a decree granting the right to marry to members of Portugal's

two most distinguished orders—the Knights of the Order of Christ and the Knights of the Order of Santiago. But the same militant Christianity led him to attempt conquests in Africa, in which he was unsuccessful, to enter into diplomatic relations with many far-off lands, and to fit out great expeditions of exploration and conquest. It was Manuel who sent Vasco da Gama around the Cape, Cabral upon the voyage which resulted in the accidental discovery of South America, Cortereal to North America, and Almeida and Albuquerque to the East Indies, where a wide field was opened for Portuguese commerce.

MANUEL II (1889-). King of Portugal in 1908-10. He was born in Lisbon two years after the Crown Prince Luis, and had the title of Duke of Beja. There were scandalous stories of his wild living in Paris, and he seemed little fitted for the throne to which he succeeded upon the assassination, on Feb. 1, 1908, of his father King Carlos I and of his brother Luis. He was acclaimed King and took the oath on May 6, 1908. When the Republicans, in October, 1910, overturned the Portuguese monarchy, Manuel escaped to England, taking refuge there at Twickenham with the Duke of Orléans, brother of Manuel's mother, Marie Amélie, who was daughter of the Comte de Paris. Royalist uprisings in Portugal in 1911 were unsuccessful. In 1912 Manuel and Dom Miguel apparently came to an understanding and joined forces for the reestablishment of the kingdom. In September, 1913, Manuel married Princess Augustine Victoria of Hohenzollern-Sigmaringen.

MANUEL, mā'nū'ēl, EUGÈNE (1823-1901). A French poet and prose writer, born in Paris of Jewish parents. From 1849 to 1871 he taught rhetoric in different Parisian lyceums. He was appointed chief of cabinet to the Minister of Public Instruction in 1871, a year later was made inspector of the Academy of Paris, and in 1878 inspector general. With his brother-in-law, E. Lévi-Alvarès, he published four volumes of lectures for the use of students, entitled *La France* (1854-55; 6th ed., 1868). Several of his verse collections were crowned by the Academy. They include: *Pages intimes* (3d ed., 1869); *Poèmes populaires* (1871); *Pendant la guerre* (1871); *Un voyage* (5th ed., 1890); *Poésies du foyer et de l'école* (16th ed., 1892). His play *Les ouvriers* (1870) also received academic honors, and Madame Sarah Bernhardt made her first appearance at the Comédie Française in his drama *L'Absent* (1873). Manuel edited the *Œuvres lyriques de Jean Baptiste Rousseau* (1852) and Chénier's *Poésies* (1884).

MANUEL, mā'nū'al, DON JUAN (1282-1349). A Spanish prince and author, born at Escalona. He was the nephew of Alfonso X, called "the Wise." His father died in his youth, and he was brought up by his cousin, Sancho IV, who was succeeded by Ferdinand IV. Upon his death Don Manuel was coregent for the young heir, Alfonso XI (1320). When the King was proclaimed of age (1325) he married Constanza, the daughter of Don Juan Manuel, appointed his father-in-law *adelantado mayor de la frontera*, and then repudiated Constanza, whom he imprisoned at Toro. This angered Don Juan Manuel, and from 1327 to 1335 there was active war between them, ending in the King's victory. He afterward received Don Juan Manuel into favor and made him general in chief of the army against the Moors. Don Juan Manuel is

better remembered now as author than as soldier, and despite the turbulence of his life he was a voluminous writer. His prose is clear, vigorous, and interesting. Several of his works may be found in Rivadeneyra's *Biblioteca de autores españoles*, vol. li (Madrid, 1884). The most important of them is *El Conde Lucanor*, first published, and with a commentary, by Gonzalo Argote de Molina in 1575. This consists of 49 stories, told somewhat in the Oriental manner, with a little moral in verse at the end of each tale. More modern editions of *El Conde Lucanor* are those of Stuttgart (1839), Barcelona (1853), Madrid (1860), Vigo (1898 and 1902), and Leipzig (1900). There is an English translation by James York (London, 1868 and 1888). For editions of his other works, and for studies about him and his works, consult James Fitzmaurice-Kelly, *Bibliographie de l'histoire de la littérature espagnole* (Paris, 1913).

MANUEL, mā'nū'ēl, **NIKOLAUS**, called **DEUTSCH** (1484-1530). A Swiss painter, poet, and magistrate, born at Bern. His early profession was probably that of an architect or painter and engraver, and in his youth he traveled much, probably visiting Italy, for his early paintings show the influence of the Paduan school. Upon his return to Bern he became a member of the Great Senate (1512), and afterward served in the French army. He was a pronounced supporter of the Swiss reformation. His writings include the fantastic satirical comedies *Vom Papst und seiner Priesterschaft*, *Der Ablasskrämer*, *Berbeli*, and *Elsli Tragdenknaben*, reedited by Tittmann in 1868 and Bachold in 1878. His works as an artist are very interesting, although his natural genius and inventive power exceed his technical ability, his execution being often faulty; they consist of a few oil and tempera paintings, and a number of drawings, mostly of soldiers and troopers, best studied in the Basel Museum. His frescoes, "The Dance of the Dead," painted on the walls of the Dominican convent (1517-22) at Bern, were destroyed, but have been well copied in the 24 lithographs, *Niklaus Manuels Totentanz* (Bern, 1829-31). In the City Hall at Basel are a number of finely colored stained-glass windows which he designed.

MANUFACTURED ARTICLE. A thing which has been created by the application of labor to crude materials, whereby they are transformed into a new and different quality, shape, or form, having a distinctive name, character, or use, and capable of being used without alteration. The term is sometimes confused with manufactured products, such as pig iron or pig lead, which are merely iron and lead reduced from the native ores and freed from impurities, and which are, in law, considered as raw or crude materials, ready to be manufactured into articles. The word "article," therefore, in its technical legal sense means a thing adapted for use. The distinction between manufactured articles and crude or raw materials is of great importance under tariff and revenue acts where the former are assessed with a higher rate of duty than the latter. The distinction above mentioned has been adopted by the United States courts in the interpretation of tariff laws. For example, India rubber, which is a product obtained by reducing the juice or sap of certain tropical trees and plants to a solid form by dipping convenient molds into it and drying it over a fire made from a peculiar kind of nut, was held not to be a manufactured article under

a tariff act taxing articles made of rubber. The court described it as a "raw material in a more portable, useful, and convenient form for other manufactures here." The court, however, held that rubber shoes, made by the same process, except that the mold was in the form of the human foot, were manufactured articles, as they were adapted for immediate use. Consult: Webster Elmes, *Treatise on the Law of the Customs* (Boston, 1887); W. W. Carr, *Judicial Interpretation by the United States Courts of the Acts of Congress Relating to the Tariff Acts* (Philadelphia, 1894); also the authorities referred to under **SALE**.

MANUFACTURERS, NATIONAL ASSOCIATION OF. An association of American manufacturers organized in Cincinnati in 1895 for the purposes of increasing their export trade, influencing legislation affecting their interests, and of coping with the demands of labor organizations. The association maintains a central office in New York which supplies members with information about foreign markets, prices, credit reports, and undertakes through its international freight bureau the shipment and delivery of foreign consignments. Its most conspicuous function is the energetic campaign which it wages against radical legislation and trade-unionism. The public measures with which the association has been most prominently connected are the reform of the patent law and of the consular and postal services. The association has placed itself on record as not being opposed to labor organizations as such, but maintains that employers must be free to employ their working people without interference on the part of individual organizations and that they must be unmolested in the management of their business and in the use of any methods or systems of pay which are equitable. The association provided for the organization of separate defense associations in the different lines of industry it represents. Provision was further made for the federation of these affiliated protected associations into a "permanent central organization that will create a clearing house for ideas and provide means for coöperation on matters of common interest." In 1907-08 the association aided in conducting a suit against the officers of the American Federation of Labor for participation in a boycott directed against the Bucks Stove and Range Company, whose president was also president of the National Association of Manufacturers. The case, which was regarded by the association as a test case, dragged out through several years; its outcome practically put an end to boycotting through the American Federation of Labor. The association conducts an educational campaign through the distribution of pamphlets, etc., in behalf of its labor and industrial policies. In 1913 it assumed an attitude of active hostility towards the I. W. W. While resistance to what it considers the unreasonable demands of labor is not the only object of the association, it is generally regarded in labor circles as essentially an anti-trade-union organization. The association publishes the *American Trade Index* and the *Confidential Bulletin of Inquiries from Foreign Buyers*; its organ is *American Industries*, published semimonthly at New York.

MANUFACTURES (ML. *manufactura*, from Lat. *manufactus*, *manu factus*, made by hand, from *manu*, abl. sing. of *manus*, hand, and *factus*, p.p. of *facere*, to make). In a broad sense of

the term, manufactures are such forms of industry as elaborate for economic use materials which are themselves the product of industry. Manufactures are thus distinguished from extractive industry, which procures wealth from nature in its primary forms. In practice it is difficult to draw a hard and fast line between these two types of industry, since many commodities which are commonly classed as raw materials have been subject to one or more elaborative processes, as, e.g., raw cotton, raw sugar, pig iron. The practice of American statisticians is to class with extractive industry processes which are directly connected with the exploitation of natural products. Butter and cheese which are made on the farm are treated as agricultural products; when produced in factories distinct from the farm they are classed with manufactures. A product in its earliest

of products in the year under review, those working to the order of the individual customer, such as custom tailors, dressmakers, shoemakers, etc., but included large concerns doing special work, such as machine shops. Establishments engaged in the building industry other than those manufacturing building materials for the general trade, as well as so-called neighborhood industries and hand trades, such as blacksmithing, harness making, and tinsmithing, in which little, if any, power machinery was used, and which did usually only a local business, were excluded; furthermore, retail stores with incidental manufacturing on a small scale, which could not be distinguished from their mercantile business, and various eleemosynary and penal institutions engaged in manufacturing industries, were also excluded. These considerations must be borne in mind in considering the tables

GROWTH OF MANUFACTURING INDUSTRIES IN THE UNITED STATES

From Thirteenth United States Census

	Number of establishments	Capital	Wage earners (average number)	Wages	Cost of materials	Value of products
Factories and hand and neighborhood industries:						
1849 (census of 1850).....	123,025	\$533,245,000	957,059	\$236,755,000	\$555,124,000	\$1,019,107,000
1859 (census of 1860).....	140,433	1,009,856,000	1,311,246	378,879,000	1,031,605,000	1,885,862,000
Per cent of increase, 1849 to 1859	14.1	89.4	37.0	60.00	85.8	85.0
1869 (census of 1870) (gold value)...	252,148	1,694,567,000	2,053,996	620,467,000	1,990,742,000	3,385,860,000
Per cent of increase, 1859 to 1869	79.6	67.8	56.6	63.8	93.0	79.5
1879 (census of 1880).....	253,852	2,790,273,000	2,732,595	947,954,000	3,396,824,000	5,369,579,000
Per cent of increase, 1869 to 1879	0.7	64.7	33.0	52.8	90.6	74.5
1889 (census of 1890).....	355,405	6,525,051,000	4,251,535	1,891,210,000	5,162,014,000	9,372,379,000

merchantable form may then be classed with raw materials; when subjected to further processes of elaboration it becomes a manufactured commodity. For the technical legal distinction in this matter, see MANUFACTURED ARTICLE.

Again, many commodities undergo minor changes incidental to consumption. The preparation of food may be cited as a case in point. Such processes are not usually placed under manufactures. If the preparation of food is carried on in separate establishments with a view to supplying a market, it will fall under the head of manufactures. This distinction is obviously difficult to make in practice. The twelfth census of the United States excludes from manufactures proper most forms of order production, confining the term to production of standard commodities for a general market, while the thirteenth census by statute was "confined to manufacturing establishments conducted under what is known as the factory system exclusive of the so-called neighborhood household and hand industries." In other words, the thirteenth-census manufactures excluded the establishments producing less than \$500 worth

accompanying this article and other tables of manufactures in the United States for this census year under review.

In the *Census of Production* taken in Great Britain in 1908 of the work of the year 1907 and published in 1912, much the same plan was followed, but the general scheme was more comprehensive. Fisheries and agriculture were omitted, but the products of mines and quarries are included as well as other items.

From a theoretical point of view, however, it is better to include under manufactures all processes of elaboration of merchantable materials into commodities primarily designed for sale. In this sense of the term manufactures presuppose a considerably developed economic life. They did not exist when each household produced exclusively for its own consumption. In western Europe they were first carried on under the guilds (see GUILD), forming, however, but an insignificant part of the economic life. With the rise of capital in the fifteenth and sixteenth centuries manufactures were carried on more extensively under the domestic system. The capitalist-merchant put out materials to be

worked up at home by workmen whose chief occupation was usually agriculture. This form of manufacture still exists in America and England; it is widely practiced in France, Germany, and Russia; and in some European districts, notably in Norway, it is the prevalent form.

In the more advanced nations domestic manufacture has been largely supplanted by the factory system (q.v.). The extension of the market in early modern times, requiring a vastly increased production of goods of standard kinds, led first to excessive division of labor and later to the invention of machinery. The first industries to respond to these influences were the textile and the iron industries.

Manufactures in the United States. At the end of the Colonial period manufacturing industry in America was of slight importance. The principal salable articles were raw materials, such as the products of the forests. Each household provided itself with the chief commodities for consumption. In New England, however, the manufacture of rum was extensive, and the production of hats, coarse cloth, and nails was carried on under the domestic system of industry. The total value of the manufactures of America at the time of the adoption of the Constitution has been estimated at \$20,000,000; but this includes much domestic production for home consumption.

Machine production scarcely existed before

1790. In that year a British mechanic, Slater, set up spinning machinery in Rhode Island. In 1794 Whitney invented the cotton gin, thus assuring a supply of raw materials for the new cotton manufacture. By 1810 machinery had been generally introduced in textile manufacture, although large quantities of goods were still produced under the older system. The value of textiles produced in that year was estimated at about \$40,000,000.

The iron manufacture developed more slowly. Machinery of improved types was introduced in the first and second decades of the nineteenth century, but the greater part of the production and manufacture was carried on in a primitive fashion, until the fifth decade of the century, when anthracite began to be substituted for charcoal in smelting. From that time increase was rapid.

The value of the manufactures of the United States for the year 1810 was estimated by Tench Cox to be \$198,613,471. In 1820 the value was \$268,000,000. The accompanying table, taken from the *Thirteenth Census, Manufactures*, vol. viii (Washington, 1913), shows the growth of manufactures from 1850.

In estimating the economic significance of the development of manufactures, shown in the table on page 37, it will be necessary to make allowance for the fact that a considerable number of operations are now carried on as manufactures

INDUSTRY (1909)	Number of establishments	WAGE EARNERS		VALUE OF PRODUCTS		VALUE ADDED BY MANUFACTURE

which formerly were a part of household industry. The increase in the net product of manufactures above cost of material is not wholly a net increase in national income, although the greater part may be so regarded. It is further to be kept in mind that the statistics of capital are based upon estimates which in the nature of the case are not very reliable.

The accompanying table shows the extent and rank in value of products of the more important manufacturing industries of the United States in 1909. The various manufacturing industries of the United States arranged in order of the amount of products in the census year 1909 are given in the accompanying table from the *Thirteenth Census, Manufactures*, vol. viii (Washington, 1913).

The four States New York, Pennsylvania, Illinois, and Massachusetts, as shown by the census of 1909, produce nearly one-half the manufactures of the United States. The greatest concentration of manufacturing industry is in southern New England and New York and eastern Pennsylvania, but there appears to be a general tendency towards extension of the area of manufactures. Consult sections on *Manufactures* in the articles on the various States; also under UNITED STATES and various other countries.

The United States occupies at present the foremost rank as a manufacturing nation. The successive stages by which it has reached this position are illustrated by the accompanying table, taken from the *Twelfth Census, Manufactures*, part i (Mulhall's estimates). These figures, which are as late as any statistician has presented on a comparative basis, must of course be considered with due regard to modern conditions when the annual value of manufactures has risen to over \$20,000,000,000 in the United States and in the United Kingdom to over \$8,750,000,000.

ANNUAL VALUE OF MANUFACTURES

	1820	1840
United Kingdom.....	\$1,411,000,000	\$1,833,000,000
France.....	1,168,000,000	1,606,000,000
Germany.....	900,000,000	1,484,000,000
Austria.....	511,000,000	852,000,000
United States.....	268,000,000	467,000,000
Other States.....	1,654,000,000	2,516,000,000

	1880	1894
United Kingdom.....	\$2,808,000,000	\$4,263,000,000
France.....	2,092,000,000	2,900,000,000
Germany.....	1,995,000,000	3,357,000,000
Austria.....	1,129,000,000	1,596,000,000
United States.....	1,907,000,000	9,498,000,000
Other States.....	3,455,000,000	5,236,000,000

For the manufacturing industries of Europe there are not available statistics compiled along the lines of the United States census. In 1908 there was taken in Great Britain a *Census of Production* for the year 1907, and the final report published in 1912 summarized the results.

While differences of classification and method do not permit exact comparison between the manufacturing industries of Great Britain and those of the United States, yet the final report of the *Census of Production* of the United Kingdom, referred to above, affords some statistics

which may be of significance in this connection. During the census year 1907 the manufacturing industries of England and Wales, Scotland, and Ireland represented a gross output measured by selling value or value of work done of £1,765,366,000. The cost of materials used amounted to £1,028,346,000; the work given out, or the amount paid to other firms, aggregated £24,885,000. The net output of productive industries, obtained by deducting from the value of the gross output the cost of materials and the amount of work given out to other firms, was £712,135,000. In these various manufacturing industries there were employed, exclusive of outworkers, 6,984,976 persons, and the net output per person employed, excluding outworkers, was £102. The total horse power of the engines owned in the various manufacturing establishments was 10,755,009.

MANUFACTURES, AMERICAN. See UNITED STATES, *Manufactures*.

MANUL, mā'nul (Malay word). A small wild cat (*Felis manul*) of Tibet and Siberia. It is whitish gray, with black marks on the chest and about the head and dark vertical bands across the loins. It has a very broad, round head. The cat is about 30 inches in length, the tail measuring a third of this. The chief character is the very dense and long fur adapted to the intense cold of the creature's haunts. Instead of being a jungle animal it makes its home among barren rocks, feeding on picas and other small mammals. It has been suggested that this is the ancestor of the Persian breed of domestic cats, but facts which rather negative this view are the smallness of the ears and the contraction of the pupils to circles instead of slits.

MANUMISSION (Lat. *manumissio*, from *manumittere*, to manumit, from *manus*, hand + *mittere*, to send). In Roman law, the enfranchisement of a slave. In the older law (*jus civile*) this could be accomplished: (1) *Vindicta*, i.e., by a fictitious action. In the later law the forms of suit were dropped and the master simply appeared before the magistrate and declared that the slave was to be set free. (2) *Censu*, i.e., by the entry of the slave's name, with the assent of the master, on the register of citizens. This form disappeared in the *im-*

perial period. (3) *Testamento*, i.e., by a bequest of liberty in the master's will. When the Roman Empire became Christian a fourth mode of manumission was recognized—*manumissio in ecclesia*, by declaration of the master in the presence of priest and congregation. Informal manumissions "among friends," or "by letter," were originally void; but in the later Republican period individuals thus freed were protected by the magistrates and in the Imperial period they were recognized as legally free. These informal manumissions were regulated, under Justinian, by requiring five witnesses to prove the manumission. The right of a master to manumit his slaves was restricted in the Imperial period. Some of the restrictions were imposed in the interest of creditors; others in the interest of the public.

By manumission the slave usually became a citizen, but his political rights were restricted. Moreover, he remained for life in a relation of dependency; he was the "client" of his master and of his master's children and owed them certain semiformal observances and services. He and his children were also debarred from marriage with free-born persons. Consult the authorities referred to under CIVIL LAW.

Among the early Germans also the ordinary forms of manumission, by the act of the master alone, gave the freedman only a partial freedom; he was dependent upon his former master for protection. There were, however, methods of manumission which gave the former slave the full rights of a freeman, viz., his adoption into a kinship group or into the tribe.

MANURES AND MANURING (from OF. *manuevrer*, *manover*, Fr. *manœvrer*, to manage, work by hand, from OF. *manœuvre*, *manovre*, from ML. *manuopera*, *manopera*, a working with the hand, from Lat. *manus*, hand + *opera*, work). In a broad sense, the term "manure" is applied to any substance used to increase the productiveness of soil. The word is commonly used in a more restricted sense to mean the excreta (solid and liquid) of farm animals, either mixed or unmixed with litter, and more or less fermented. In this article the term is used in its broader sense. Manures may be direct or indirect in their effect. The former supply plant food which is lacking in the soil, the latter render active the insoluble fertilizing constituents already present and improve the chemical, physical, and biological conditions in the soil. The first class includes the so-called commercial or artificial fertilizers, such as superphosphates, nitrate of soda, etc.; the second embraces natural manures, such as the green manures, seaweed (q.v.), and animal manures. A third class includes the soil amendments or soil improvers, such as marl, lime, gypsum, salt (q.v.), etc., and the so-called catalytic or stimulant fertilizers, such as salts of manganese, aluminium, iron, boron, lead, zinc, etc., whose fertilizing value has not yet been definitely determined. Under certain conditions most of these manures may be both direct and indirect in their action.

Plants derive the larger part of their food directly or indirectly from the atmosphere. A small but very essential portion, however, is drawn from the soil. This includes the inorganic or ash constituents and nitrogen, which, however, is in certain cases derived indirectly from the air. Of the soil constituents which plants need those most likely to be exhausted

by ordinary systems of cropping are nitrogen, phosphoric acid, potash, and, in some cases, lime and possibly sulphur. Direct manures supply one or more of these constituents. The fertility of the soil would remain practically unchanged if all the ingredients removed in the various farm products were restored to the land. This may be accomplished to a large extent by feeding the crops grown on the farm to animals, carefully saving the manure and returning it to the soil, and when practicable combining a judicious use of green manures with a system of stock feeding in which those farm products comparatively poor in fertilizing constituents are exchanged for purchased feeding stuffs rich in these substances. Under such practice the loss of soil fertility may be reduced to a minimum or there may even be an actual gain in fertility. Under ordinary conditions of farming, however, the manure produced on the farm is not sufficient to maintain its fertility. Roberts estimates that in ordinary mixed husbandry only about one-half of the fertility taken from the soil by crops is restored in farm manures. Hence the necessity for supplying the deficiency from other sources, resulting in the wide use of artificial or commercial fertilizers of various kinds.

Natural Manures. These include all manurial substances derived from natural sources without undergoing any specific treatment or process of manufacture, such as animal excreta, animal and vegetable refuse of the farm, and peat, as well as various factory wastes. The natural manures are, as a rule, bulky in character and contain small amounts of the essential constituents. The most important and useful of the natural manures is farmyard or barnyard manure. Its quality, which is very variable, depends upon the care taken in its preservation, the kind and age of the animal producing it, the quantity and quality of the food used, nature and amount of the litter added.

Mature animals, neither gaining nor losing weight, excrete practically all of the fertilizing constituents consumed in the food. Growing animals and milch cows excrete from 50 to 75 per cent of the fertilizing constituents of the food; fattening or working animals from 90 to 95 per cent. Roberts states that the value of the manure produced by animals is from 30 to 50 per cent of that of the food they consume. As regards the fertilizing value of equal weights of manure in its normal condition, farm animals probably stand in the following order: poultry, sheep, pigs, horses, cows. Poultry manure is the richest of the animal manures, because it consists of a mixture, in somewhat concentrated form, of both the solid (intestinal) and liquid (urinary) excreta. The liquid excrement of farm animals is the most valuable part of the manure, being especially rich in nitrogen and potash, but poor in phosphoric acid. Sheep manure is drier and hence richer in fertilizing constituents than pig, horse, or cow manure. Pig manure contains as much water as cow manure and more than horse manure, but is richer in nitrogen. Horse manure is comparatively dry manure, which ferments rapidly. For this reason it is called a hot manure and is especially valuable for use in hotbeds and for forcing early crops. Cow manure is a wet cold manure, which ferments slowly. Its low percentage of fertilizing constituents is due to its high percentage of water. The amounts of fer-

tilizing constituents in animal manure stand in direct relation to those in the food. As regards the value of the manure produced the concentrated feeding stuffs, such as meat scrap or meal, cottonseed meal, linseed meal, gluten meal, and wheat bran, stand first; the leguminous plants (clover, peas, beans, etc.) second; the grasses third; cereals (oats, corn, etc.) fourth; and root crops, such as turnips, beets, and mangel-wurzels, last. High salting and succulent foods as a rule give watery and poor manure. With high feeding there is less complete digestion and hence richer manure. Highly nitrogenous foods give richer manures, although at the same time they increase the excretion of urine, thus requiring more bedding and reducing the value of the manure, if, as is frequently the case, the material used as litter is poorer in fertilizing constituents than the animal excreta. Animals kept in cold quarters probably digest their food more closely, and hence make poorer manure.

Barnyard manure rapidly deteriorates from two chief causes: (1) fermentation, which be-

of fresh manure renders it better suited to early garden truck, grasses, and forage plants than to plants grown for seed, such as cereals. Direct applications to root crops, such as sugar beets, potatoes, or tobacco, often prove injurious. This result can, as a rule, be avoided by applying the manure some months before the planting of the crop or by using only well-rotted manure. Barnyard manure is not applied to fruit trees with the same good results as in case of other crops. It does not stimulate fruiting to the same extent as the mineral fertilizers. This is probably due to the fact that it is poor in total and available mineral constituents and comparatively rich in nitrogen, which tends to produce large growth but a poor quality of fruit. As a rule, therefore, the best results are likely to be obtained by using barnyard manure in connection with commercial fertilizing materials, lime, gypsum, etc., either in compost (q.v.) or separately.

Other natural manures of secondary importance are peat, ashes (qq.v.), wool waste, which contains on an average 5.5 per cent of nitrogen,

AMOUNT AND VALUE* OF MANURE PRODUCED BY FARM LIVE STOCK

(New York Cornell Experiment Station and other sources)

* Valuing nitrogen at 15 cents, phosphoric acid at 6 cents, and potash at $4\frac{1}{2}$ cents per pound.

† Fine-cut straw of known composition in sufficient quantity to keep the animals clean.

‡ According to the Maine Experiment Station each hen produces about 30 pounds per year of manure which can be saved.

gins as soon as the manure is dropped; (2) weathering and leaching, which rapidly reduce the value of unprotected manure. Roberts reports experiments at Ithaca, N. Y., in which manure exposed in loose heaps of from two to 10 tons each lost from 42 to 62 per cent of its value in six months, and cow manure 30 per cent; while mixed and composted manure lost only 9 per cent. The loss from destructive fermentation may be considerably reduced by the use of proper absorbents (litter), but the most perfect preservation is secured by storing the mixed manure of different animals under cover and keeping it compact to exclude air. Extremes of temperature and moisture should be avoided to prevent "fire-fanging" and to secure a uniform, moderate, and harmless fermentation. Such fermentation, in fact, improves the quality of poor, coarse manure by rendering its constituents more available as plant food.

When practicable, it is best to avoid storage by hauling the manure directly to the fields and spreading it upon land occupied by plants. From 10 to 40 tons per acre is usually applied. Moderate applications at frequent intervals are preferable to large but infrequent applications, except when the purpose is to warm the soil to force early crops. Excessive use of manure, as in forcing-house work, sometimes causes the soil to become "manure sick." Heating the soil has been suggested as a remedy. The forcing effect

1 per cent of phosphoric acid, and 2 per cent of potash; hair waste, containing 7 per cent of nitrogen and less than 1 per cent of phosphoric acid; felt waste, with about 8 per cent of nitrogen; leather, with about 7 per cent of nitrogen. Peat and the wastes mentioned are principally valuable for the nitrogen they contain, but this is very slowly available to plants and hence not of great value.

Intermediate in character between the natural manures proper and artificial or commercial fertilizers are the soil amendments or soil improvers and the so-called catalytic or stimulant fertilizers, to which reference has already been made, and which are valuable as a rule for their indirect or stimulant effect rather than as direct sources of plant food.

Artificial or Commercial Fertilizers. With the continued sale of products from the farm the natural manures available are often insufficient, as already explained, to maintain the original fertility of the soil. In specialized intensive farming, moreover, there is a demand for an abundant supply in the soil of more active plant food than farm manures furnish, in order that the high-value crops grown under such conditions may be forced into early, rapid, and vigorous growth. Under such circumstances the more concentrated and available forms of commercial fertilizing materials are used to good advantage. There are numerous sources of supply of such

materials, which may be divided into three classes, viz., nitrogenous, furnishing nitrogen; phosphatic, furnishing phosphoric acid; and potassic, furnishing potash. It is assumed in the preparation of fertilizers that the constituents most likely to be deficient in soils are nitrogen, phosphoric acid, and potash. A fertilizer, therefore, containing all three of these is termed complete, one containing only one or two of them incomplete. The price of a fertilizer is based upon the price of the nitrogen, phosphoric acid, and potash it contains.

Nitrogen, the most costly ingredient of fertilizers, is derived mainly from organic matter, ammonium salts, and nitrates, but also in recent years from calcium cyanamide (see CYANAMID), containing about 20 per cent of nitrogen as offered for sale as a fertilizer. Nitrates furnish the most available form of nitrogen. The nitrate most commonly used as a fertilizer is nitrate of soda (Chile saltpetre), which contains on the average 16 per cent of nitrogen, although basic calcium nitrate, containing 13 per cent of nitrogen, a product obtained, like calcium cyanamide, from electrical fixation of the free nitrogen of the air, is also coming into use as a fertilizer and is considered somewhat more effective than nitrate of soda on soils in need of lime as well as nitrogen. The more valuable sources of organic nitrogen are dried blood and tankage, which are produced in large quantities in slaughterhouses and rendering establishments; dried fish, residue from fish oil and canning establishments; and cottonseed meal, a by-product of cottonseed-oil manufacture. (See table on page following for composition.) Nitrogen in the form of ammonium salts stands between that of nitrates and organic nitrogen as regards efficiency. It is obtained for use as a fertilizer almost exclusively as ammonium sulphate, prepared largely as a by-product of gas works, coke ovens, etc., and containing on an average about 20 per cent of nitrogen. The nitrates are readily available, but also very soluble, and hence likely to be rapidly leached out of the soil. The ammonia salts, however, while considered less efficient than nitrates, are not so readily leached out of the soil, although extremely soluble. When used with proper precaution the nitrogen of calcium cyanamide is considered about as efficient as that of ammonium salts. The organic forms of nitrogen are practically insoluble and unavailable until they have been converted into ammonia compounds and undergone nitrification (q.v.) in the soil. They vary widely with respect to the rapidity with which these changes occur, dried blood and meat products, freed as completely as possible from fat, standing first, cottonseed meal and similar vegetable products next, and leather, hair, horn, and hoof lowest.

Phosphoric acid of fertilizers is derived from bone, mineral phosphates, and phosphatic, basic, or Thomas slag, a by-product of the manufacture of steel from phosphatic ores. In these it is present mainly as calcium phosphate (tricalcium phosphate, $(\text{CaO})_3 \cdot \text{P}_2\text{O}_5$, in the first two, tetracalcium phosphate, $(\text{CaO})_4 \cdot \text{P}_2\text{O}_5$, in the last). It is found in fertilizers in three forms: (1) tricalcium phosphate, largely insoluble in water and other weak solvents, designated in fertilizer analysis as "insoluble" phosphoric acid; (2) soluble in water and readily available to plants, as the superphosphates, which are prepared from

bones, bone black, mineral phosphates, etc., by grinding and treatment with sulphuric acid, thus converting the insoluble tricalcium phosphate into soluble monocalcium or acid phosphate, $\text{CaO} : (\text{H}_2\text{O})_2 \cdot \text{P}_2\text{O}_5$; (3) "reverted," or in form of dicalcium phosphate, $(\text{CaO})_2 \cdot \text{H}_2\text{O} \cdot \text{P}_2\text{O}_5$, which is not soluble in pure water, but is soluble in weak solutions of organic acids and their salts. This form results from the tendency of soluble monocalcium phosphate to revert to a less soluble (dicalcic) form. In fertilizer analyses it is classed with the water-soluble as available.

Potash, as a constituent of fertilizers, exists in a number of forms, but chiefly as chloride or muriate and as sulphate. All forms are freely soluble in water and are believed to be nearly, if not quite, equally available, but it has been found that the chlorides may injuriously affect the quality of tobacco, potatoes, and certain other crops. The chief sources of potash are the potash salts from Stassfurt, Germany—kainite, carnallite, sylvinit, muriate of potash, sulphate of potash, and double-manure salt (sulphate of potash and magnesia). Wood ashes and cotton-hull ashes are also important sources of potash, and the Pacific coast kelps (see KELP), which are very rich in potash, have recently been exploited for this purpose. Kainite, carnallite, and sylvinit are crude products of the mines, and contain, in addition to potash, a number of other salts, chiefly sodium chloride and magnesium sulphate. Kainite and the sulphate and chloride are the principal salts on the market for fertilizing purposes. The potash in kainite, though in the form of a sulphate, produces an effect quite similar to that derived from the use of muriate, because of the large quantities of chlorides mixed with it. It contains on the average about 12½ per cent of actual potash. The muriate and sulphate are refined products and contain on the average not less than 50 per cent of actual potash. The chief impurity in the case of the muriate is common salt. High-grade double sulphate of potash and magnesia ("double-manure salt"), which is used to a limited extent as a fertilizer, contains about 26 per cent of actual potash, though much lower grades of this material are found. See also table of composition below.

The substances referred to above as the sources of nitrogen, phosphoric acid, and potash are the raw materials from which the various manufactured brands of fertilizers are compounded. The quality of a mixed fertilizer will depend upon the character of the raw materials selected, as regards both amount and availability of their fertilizing constituents, and upon the proportions in which they are mixed. For instance, in one brand the nitrogen may be entirely in the form of insoluble organic materials and the phosphoric acid as insoluble mineral phosphates, while in another all three forms of nitrogen may have been used, viz., nitrates, ammonium salts, and organic matter, with phosphoric acid entirely in the form of superphosphate. The total plant food may be just as large in the first as in the second brand, but its availability and the immediate effects from its use would be much larger in the second case than in the first. Since chemical analysis cannot always tell with certainty the source and availability of the essential constituents of fertilizers, especially of the organic nitrogen, it is often desirable to purchase the unmixed materials, either for use

separately or to be mixed on the farm as required.

To use fertilizers to the best advantage it is necessary to take into consideration a variety of conditions, among the more important of which are the character of the fertilizer itself, the character of the soil and its previous manuring and cropping, the climate, and the crop to be grown. In general, concentrated fertilizers prove most profitable on: (1) soils in good physical condition, i.e., well tilled and abundantly supplied with humus; and (2) high-value crops, such as are grown in market gardening. Different classes of farm crops vary in their

the slow-growing beets and mangels; soluble phosphates in abundance for the turnip; and potash for potatoes, white and sweet. That is, while the fertilizers should contain all three elements, individual crops, because of their peculiarities of growth, require certain fertilizing constituents in greater relative amounts and in immediately available forms. Fruit trees are slow-growing plants and therefore do not need quick-acting fertilizers as a rule. Highly soluble manures, such as nitrate of soda, are likely to be washed out of the soil without being utilized. For this reason the use of nitrate of soda is not advised except where the growth of

COMPOSITION OF THE PRINCIPAL COMMERCIAL FERTILIZING MATERIALS

	Nitrogen	Available phosphoric acid	Insoluble phosphoric acid	Total phosphoric acid	Potash	Chlorine
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
1. Supplying nitrogen:						
Nitrate of soda.....	15.5 to 16					
Calcium nitrate, basic.....	13					
Sulphate of ammonia.....	19 to 20.5					
Calcium cyanamide.....	20					
Dried blood (high grade).....	12 to 14					
Dried blood (low grade).....	10 to 11			3 to 5		
Concentrated tankage.....	11 to 12.5			1 to 2		
Tankage (bone).....	5 to 6			11 to 14		
Dried fish scrap.....	7 to 9			6 to 8		
Cottonseed meal.....	6.5 to 7.5			1.5 to 2	2 to 2	
Castor pomace.....	5 to 6			1 to 1.5	1 to 1.5	
2. Supplying phosphoric acid:						
South Carolina rock phosphate.....			26 to 28	26 to 28		
South Carolina rock superphosphate (dissolved South Carolina rock phosphate).....		12 to 15	1 to 3	13 to 16		
Florida land rock phosphate.....			33 to 35	33 to 35		
Florida pebble phosphate.....			26 to 32	26 to 32		
Florida superphosphate (dissolved Florida phosphate).....		14 to 16	1 to 4	16 to 20		
Bone black.....			32 to 36	32 to 36		
Bone black superphosphate (dissolved bone black).....		15 to 17	1 to 2	17 to 18		
Ground bone.....	2.5 to 4.5	5 to 8	15 to 17	20 to 25		
Steamed bone.....	1.5 to 2.5	6 to 9	16 to 20	22 to 29		
Dissolved bone.....	2 to 3	13 to 15	2 to 3	15 to 17		
Thomas slag.....				*11.4 to 23		
3. Supplying potash:						
Muriate of potash.....					48 to 52	45 to 48
Sulphate of potash (high grade).....					48 to 52	.5 to 1.5
Sulphate of potash and magnesia.....					26 to 30	1.5 to 2.5
Kainite.....					12 to 12.5	30 to 32
Sylvinite.....					16 to 20	45 to 46
Cotton-hull ashes†.....				7 to 9	20 to 30	
Wood ashes (unleached)†.....				1 to 2	2 to 8	
Wood ashes (leached)†.....				1 to 1.5	1 to 2	
Tobacco stems.....	2 to 3			3 to 5	5 to 8	
Giant kelps, Pacific coasts, dry.....					20	

* In good Thomas slag at least 80 per cent of the phosphoric acid should be soluble in ammonium citrate, i. e., available.

† Cotton-hull ashes contain about 10 per cent of lime, unleached wood ashes 30 to 35 per cent, and leached wood ashes 35 to 40 per cent.

fertilizer requirements. The cereals, maize excepted, and grasses are similar in their habits of growth and are able to utilize comparatively insoluble forms of mineral plant food, but are much benefited by nitrogen, especially nitrates, applied in time to carry them through the period preceding maturity. It is for the latter reason that nitrogen has been termed the ruling or dominant element for this class of plants. Leguminous plants—clover, peas, beans, etc.—which are capable of acquiring nitrogen partly from the air, make liberal use of the mineral constituents, especially potash and lime. Fertilizers for such plants should therefore contain an abundance of the mineral constituents only, potash being the dominant element. Root and tuber crops require an abundance of all the fertilizing constituents in readily available forms. Of the three classes of fertilizing constituents, the nitrogen is especially useful for

nursery stock is to be forced or where bearing trees exhibit a lack of luxuriance in foliage. Frequently, however, it is desirable to stimulate the growth and fruitfulness of the trees, and for this purpose more active fertilizing materials than the above are needed. In selecting and mixing the latter the fact that fruits are potash feeders should be taken into consideration. The fertilizer requirements of small fruits are similar to those of orchard fruits, but, being as a rule more rapid growers, they can utilize to advantage heavier applications of soluble fertilizing materials and do not derive the same benefit as orchard fruits from slowly decomposing manures.

It may be said that in general crops grown on soils poor in decaying vegetable matter (humus) are as a rule benefited by applications of nitrogenous manures, while those grown upon soils well supplied with this substance are more

benefited by phosphates and potash. Upon heavy soils phosphates are likely to be more beneficial than nitrogen, while the reverse is the case on light dry soil. Sandy soils are as a rule deficient in potash, while clayey soils contain this element in larger quantities. Deep-rooting crops with long seasons of growth are able to acquire the necessary plant food where shallow-rooted and short-season crops would suffer. As regards the different forms of fertilizing materials it may be said that nitrates and soluble phosphates should be applied only a short time before they are required by the plant. Potash salts, ammonium sulphate, organic nitrogenous matter, and insoluble phosphates, being less likely to be converted into less available forms or leached out of the soil, may be safely applied weeks or even months before they are needed. In general farm practice the best results are likely to be obtained in the use of fertilizers by applying them systematically, i.e., by adopting a combined system of rotation and manuring which is adapted to the given conditions of crop, climate, and season, and which provides for the utilization to the best advantage of the home and local supplies of manures.

The preparation and use of commercial fertilizers on an extensive scale practically dates from the announcement of Liebig's theory of plant nutrition in 1840 and the publication soon after of the results of Lawes's experiment on the preparation and use of superphosphates as a fertilizer. Since that date the industry has grown to enormous proportions. A recent estimate values the world's consumption of fertilizers at \$400,000,000.

The composition of the more important materials used in the preparation of fertilizers is shown in the table on the preceding page.

MANUSCRIPT (Lat. *manu scriptum*, written by hand). A term applied to anything written by hand, on either hard or soft and flexible substances. The hard substances are principally stones, metals, bone, and wood, on which the writing is in the nature of engraving; the soft or flexible substances are especially papyrus, wax, parchment and other skins, textiles, and paper, while terra cotta or clay partakes of both classes. The instruments used were the wedge, stylus, brush, and graver for

the hard, and the reed, quill, stylus, and metal pen for the soft substances. The stone chisel was used in rock writings. In the matter of inks, black was always the ordinary color, and red was used at an early date (e.g., in Egypt) for decorative purposes; other colors had a special meaning, as purple was the Imperial color of the Byzantine and Carolingian emperors and yellow the Imperial color in China. For the history of the methods of production and preservation of various kinds of manuscripts, see BOOK; CODEX; CUNEIFORM INSCRIPTIONS; LIBRARIES; PALEOGRAPHY; PAPYRUS.

MANUSCRIPTS, ILLUMINATED. See ILLUMINATED MANUSCRIPTS.

MANUTIUS, mā-nū'shī-ūs. The Latin name of a famous family of Italian printers.—TEOBALDO MANUCCI, better known as ALDO MANUZIO (Aldus Manutius), was born at Sermoneta, near Rome, in 1450. Having studied Latin at Rome under Gasparino da Verona and Greek at Ferrara under Battista Guarini, Manuzio went in 1482 to live at Mirandola with his old friend Giovanni Pico. Pico got Manuzio a place as tutor to his nephews, Alberto and Lionello Pio, princes of Carpi. Alberto supplied the funds with which Manuzio, in company with Andrea Torresano d'Asola, bought the press of Nicolas Jenson, and brought the great Aldine firm into existence. Manuzio, or Aldo, to use the name now most familiar, settled in Venice in 1490, and soon published the undated *Hero and Leander* of Musaeus, the *Galeomyomachia*, and the Greek Psalter. In 1495 the first volume of Aristotle appeared. Nine comedies of Aristophanes followed in 1498. Thucydides, Sophocles, and Herodotus came out in 1502; Xenophon's *Hellenics* and Euripides appeared in 1503, Demosthenes in 1504. In 1513 Plato was issued, and Pindar, Hesychius, and Athenæus came out in 1514. Aldo's press now devoted itself to printing Latin and Italian works, including the *Divine Comedy*. These works (1495–1514) were printed with Aldine types, a style cast by Francesco da Bologna and quite absurdly, according to a legend originating in an error of A. Firmin Didot (1872), said to have been copied from the handwriting of Petrarch. Italic type was invented by Aldo, as is shown by his *Monitum* of March 16, 1503, reprinted in Renouard (vol. iii). Italics were soon adopted by Lyons printers. Apparently the first book thus printed at Lyons was issued in 1501. Aldo was an ardent humanist, and the Academy of the Filelleni (better known as the Aldine Academy), which he gathered around him, has the distinction of being one of the most serious in purpose and accomplishment of the time. He loved the books that he printed and wished to make not only them but his manuscripts accessible to many. Symonds roughly estimates the current price of Aldo's pocket series of Greek, Latin, and Italian classics, begun in 1501, at two shillings a volume. It would seem that Aldo's books were cheaper than those of modern publishers, who have hardly surpassed him in quality at their best. In 1499 Aldo had wedded Maria, the daughter of his colleague Andrea Torresano. On Feb. 6, 1515, Aldo died, leaving three sons to help carry on his business.—PAULUS MANUTIUS (1512–74), born in Venice, June 12, 1512, took up in 1533 the task which had meanwhile been done mainly by his grandfather, Andrea Torresano. Paolo set up his own firm and devoted himself mainly to the Latin classics. He skill-

fully edited Cicero's *Letters and Orations*, and published his own Latin version of Demosthenes. In 1561, at the invitation of Pius IV, he went to Rome, where he was to have 500 ducats a year and enough to defray the cost of his press. The profits were to be equally divided between Paolo and the Camera Apostolica. Paolo seems to have fared well under Pius IV, but the coldness of Pius V compelled him to leave Rome. He went back, however, and died there in 1574. His partnership with the papacy was more favorable to theological writers than to classic literature.—ALDUS MANUTIUS, the younger (1547-97), son of Paolo, was born Feb. 13, 1547, and died in Rome, Oct. 28, 1597. At the age of nine his name appeared on the title-page of the *Eleganze della lingua toscana e latina*. In 1561, whether with or without help we do not know, he produced a work on Latin spelling, *Orthographiæ Ratio*, which he completed with an *Epitome Orthographiæ* in 1575, both highly valuable books. In 1572 Aldo married Francesca Lucrezia, daughter of Bartolomeo Giunta, grandson of that Giunta who had established the famous Venetian press. This was a lucky alliance, for the Aldine press had been steadily declining, while the other was growing richer. In 1574 his father's death in Rome made Aldo the younger head of the firm. His commentary of the *Ars Poetica* of Horace (1576) maintained the family's traditional blending of good printing and scholarship. As a professor of belles-lettres Aldo went to Bologna (1585), and thence to Pisa (1587). There he printed Alberti's comedy *Philodoxius*, and attributed it strangely to Lepidus. In 1588 he went to Rome and again turned to printing, with Clement VIII as his patron, until his death.

MAN WITHOUT A COUNTRY, THE. A story by Edward Everett Hale, first published anonymously in the *Atlantic Monthly* (1863).

MANX CAT. See *Domestic Cats*, under **CAT**.

MANX LITERATURE. The Celtic dialect still spoken by about 3000 persons on the west coast of the Isle of Man is closely related to Irish and Scottish Gaelic, standing nearer on the whole to the latter. (See **CELTIC LANGUAGES**.) Unlike both of them, Manx has abandoned the traditional Gaelic orthography and modeled its spelling rather upon English. Manx literature, so far as preserved, is scanty and confined to the modern period. The principal monuments are the translations of the Book of

Common Prayer and of the Bible. The former was first published in 1765; the latter in 1771-75. But an older manuscript version of the Prayer Book, completed by Bishop Phillips in 1610, has been recently printed by John Rhys and A. W. Moore (Douglas, 1895). Moore has also published several books dealing with the history and popular traditions of the Isle of Man. The native literature, of which this author gives specimens, consists principally of ballads, and carvels (the local term for carols) sung on Christmas Eve.

Bibliography. A general account of Manx remains was given by H. Jenner in the *Transactions of the London Philological Society* (London, 1877). John Kelly's *Practical Grammar of Manx and Manx Dictionary* have both been published by the Manx Society (Douglas, 1859). Professor Rhys contributed an investigation on the *Outlines of Manx Phonology* to the edition of Bishop Phillips's *Book of Common Prayer* (ib., 1894). The following publications of A. W. Moore are all of value: *The Surnames and Place Names of the Isle of Man* (London, 1890); *The Folk-Lore of the Isle of Man* (Douglas, 1891); *Manx Carols* (ib., 1891); *A History of the Isle of Man* (London, 1900). P. M. C. Kermodé's *Manx Crosses* (London, 1907) is devoted to the inscribed and sculptured monuments of the Isle of Man from about the end of the fifth to the beginning of the thirteenth century. For Manx folklore, see John Clague, *Cocinaghtyn Manninagh*, or *Manx Reminiscences* (Castletown, 1911). For a brief sketch of Manx literature, consult L. C. Stern, "Schottisch gälische und Manx Literatur," in *Die romanischen Literaturen und Sprachen* (Berlin, 1909). Edmund Goodwin's *First Lessons in Manx* (Dublin, 1911) is also a useful work.

MAN-YO-SHU, mán-yō-shō' (Jap., Collection of a Thousand Leaves). The most ancient anthology in the Japanese language. It was formed in the eighth century A.D., being one of the first books written in Japan. It retains the highest place in the estimation of Japanese critics, and a whole literature has gathered around it. To the foreign student its chief value is in its facts and allusions, which make it a prime source for the study of ancient Japanese history and sociology.

MANZANARES, mán-thá-ná'rás. A town in the Province of Ciudad Real, Spain, situated 98 miles south of Madrid, in a vast and arid plateau known as La Mancha, 1980 feet above the sea level (Map: Spain, D 3). The town is well built and contains a modern church of Gothic architecture and an ancient, moat-surrounded castle, built after the defeat of the Moors at Las Navas de Tolosa (1212). The country around is flat, requiring irrigation to render the soil productive. The climate is healthful and delightful; the chief industry is the raising of saffron and making Valdepeñas wine. There are manufactures of cloth, soap, and brandy. Pop., 1900, 11,181; 1910, 14,176.

MANZANILLO, mán-sá-nē'lyō. A port in the Province of Santiago de Cuba, Cuba (Map: Cuba, H 6). It is situated on the west coast of the province, at the head of the Gulf of Guacanayabo, in a low and unhealthy region surrounded by mangrove swamps. Though not very attractive in appearance, it is regularly built, with straight and wide streets crossing at right angles. It has four high schools, several hospitals, and a good market. The roadstead,

protected by the Keys of Manzanillo, forms a capacious harbor. The city serves as the port of Bayamo, and is the outlet for the products of the fertile Cauto Valley, the chief of which are sugar, tobacco, and lumber. It is the seat of a United States consular agent. Pop., 1899, urban, 14,464, municipal, 32,288; 1907, urban, 15,819, municipal, 54,900.

MANZANILLO (*Puerto de Colima*). A seaport of the State of Colima, Mexico, situated on the beautiful bay of Manzanillo, an arm of the Pacific (Map: Mexico, G 8). The Mexican government has transformed the bay into an excellent harbor by the construction of an extensive breakwater and sea wall. It is served by a number of steamship lines, and a national railway connects it with Colima, the capital of the state, 40 miles inland. In 1913 its exports, consisting of bullion, hides, timber, and coffee, were valued at \$306,317, and its imports, chiefly machinery and vehicles, amounted to \$1,486,148. It is the seat of a United States consul. Pop., 1910, 1503. Consult P. F. Martin, *Mexico of the Twentieth Century* (New York, 1907).

MANZANITA, mǎn'zǎ-ně'tǎ. A California shrub. See ARCTOSTAPHYLOS and Plate of CALIFORNIA SHRUBS.

MANZONI, mǎn-dzǒ'ně, ALESSANDRO (1785-1873). An Italian poet and novelist, born at Milan, March 7, 1785. Having completed his early training at Milan and Pavia, he accompanied his mother (a daughter of Cesare Beccaria) to Paris in 1805, and with her he frequented some of the most fashionable salons, especially those in which the encyclopædic and rationalistic ideas of the preceding century still retained a hold. But the skeptical opinions that this Parisian sojourn gave him were not to last. His acquaintance with the French scholar Fauriel began at this time and greatly influenced his later artistic development. Back in Milan in 1808, he married Enrichetta Blondel, a follower of the Reformed religion. The couple went to Paris, and there in 1810 the marriage was solemnized according to the rites of the Catholic faith, which the wife embraced and which Manzoni practiced from this time on with sincere ardor. After 1810 he made his home in the region of Milan. He was on terms of closest intimacy with such writers as Massimo d'Azeglio, who married his daughter, Tommaso Grossi, the novelist, and Berchet. During his later years he became the acknowledged leader of Italian thinkers and men of letters, among whom he had numberless friends and correspondents. Although an avowed patriot, he played no very public part in the struggles for political independence, so that he was included in no proscription. He became a Senator in 1860. He died May 22, 1873. During his youthful period Manzoni produced poems after the manner of the school of classicists, reflecting his earlier skeptical feelings, e.g., the *Trionfo della libertà*, obviously written under the influence of Monti; a composition in blank verse entitled *In morte di Carlo Imbonati*, and the *Urania*. The period between 1816 and 1825 was his most active one in the production of works in both prose and verse. To it belong the *Inni sacri*, which are full of exalted religious sentiment, one or two political canzoni, and the poem that made him really famous, the *Cinque maggio*, an ode on the death of Napoleon (1821). Of this same period are his dramatic compositions with which he hoped

to inaugurate a reform in the Italian theatre. They are the *Conte di Carmagnola* and the *Adelchi*, the former published in 1820 and the latter in 1822 (at Milan). Admirable as literary performances, they are not adaptable to scenic production, and neither was well received at home, although Goethe warmly praised the *Conte di Carmagnola*. In connection with these pieces Manzoni enunciated the following principles: the dramatic composer should adapt the poetic invention to the historic fact and not follow the contrary practice; the unities of time and place need not be observed; the style and the dialogue should be perfectly natural; and the chorus, a sort of commentary on the events enacted, should provide a place in which the author may freely express his own feelings. Of the prose publications of Manzoni, noteworthy is the *Morale cattolico* (Milan, 1819), a reply to Sismondi's strictures upon Catholicism. His critical output is remarkable for its trenchancy and soundness. His masterpiece is the novel *I promessi sposi* (*The Betrothed*) (Milan, 1825-26). Somewhat cumbersome in plot, this romance, for its sage reflections on human nature, its graphic descriptions (especially that of the plague at Milan in 1631), and its masterly portrayal of characters, has deeply influenced mature minds of every nation: such a scholar as the American Andrew D. White calls it the best historical novel ever written. Many of its figures—the unnamed knight, repentant in the consciousness of sin, Fra Cristoforo, the monk of unswerving piety and sacrifice, the weak but very human priest Don Abbondio, Gertrude, the nun with no love for her calling—have become universal types. Aside from its artistic merit, the romance has great value as an historical study of the seventeenth century in Italy. In its revised form (1840) it became the illustration of Manzoni's theory of the national Italian language, as regards vocabulary and syntax (see ITALIAN LANGUAGE), and as such still figures as an important language text in Italian schools. It had numerous epigones among later novels (e.g., the *Monaca di Monza* of Rosini). The ode of *Pentecost* (from the *Inni sacri*) and the *Cinque maggio* (translated into English, Oxford, 1905) are masterpieces of the first order, and are the best reflections of the force of religion in Manzoni's intellectual outlook on life.

Martini (Milan, 1914).

MAORI, mā'ō-ri. The Polynesian race found in New Zealand by the first white men who discovered the island. Above the average in stature, they are more or less robust, with athletic frames. The head form is dolichocephalic. The women for the most part are strong and vigorous. Both sexes are adepts in swimming and the people are fond of bodily exercise. Some authorities hold, on insufficient grounds, that the

Maoris and other Eastern Polynesians are non-Malay, and Caucasian rather than Mongolic, although they admittedly speak dialects of the common Malayo-Polynesian speech. A few more venturesome inquirers have even sought to show that the Maori tongue is related to the Aryan family of languages. But all such efforts are vain. The Moriori of Chatham Islands are hardly more than a branch of the Maori, with perhaps more of a pre-Maori Melanesian intermixture, noticeable not only in physical characteristics, but also in art, weapons, etc. The Maoris are noted for their tattooing, their ornamental and decorative art, their epic poetry, legends, and mythology. In earlier times they were among the most cannibalistic of Polynesian peoples, despite their relatively high culture. Their long and valiant struggle with the British colonists, in the course of which they displayed some brilliant war tactics, gained for them the respect of their opponents, and they now have their representatives in the Legislature on the same basis as their white fellow countrymen. The Maoris, scattered over parts of the northern island and the northern portion of the southern island, seem, according to the last census, to be increasing in numbers. Considerable intermarriage has also taken place. There were two Maoris in the New Zealand cabinet of 1906.

MAP (from Lat. *mappa*, napkin). The representation of the whole or a portion of the earth's surface, or of the heavens, upon a plane surface, usually on a greatly reduced scale. Map and chart (q.v.) are nearly synonymous terms, though the latter is now chiefly used to designate a map designed for navigational or astronomical purposes. The earliest maps of the simpler sort were doubtless prehistoric, as from the accounts of explorers of old as well as of modern times it has been found that many of the most ignorant and primitive savages make and use rude plans of their surroundings, whether of land or water, while Eskimo and American Indians have been found able to understand the charts of the white man in addition to making for themselves rude maps. The earliest historical record of map making is that of Sargon, King of Akkad, one of the states of Babylonia, which existed before the formation of the Babylonian or Assyrian Empire. The date of these maps is about 3800 B.C., and they are cadastral or topographical surveys, with a pretense at accuracy in the representation of lands, inasmuch as they were prepared for purposes of taxation. Other surveys in Babylonia and Assyria are depicted on clay tablets dating from 2300 to 2100 B.C., now in the British Museum. At least as early as 1300 B.C. map making was common in

Egypt, as at the time of Ramses II (Sesostris of the Greek historians, 1333-1300 B.C.) a survey and map of the country were made in view of the necessity of apportioning land and the readjustment of the boundaries after the Nile floods. In fact, under these conditions the pharaohs had virtually to maintain a land office. According to Herodotus, such early work was the origin of geometry and surveying, with consequent map construction. The oldest map extant is an Egyptian papyrus of the thirteenth century B.C. in which some Nubian gold mines are shown.

One of the first students of the world-wide geography was Thales of Miletus (624-543 B.C.); and Anaximander (610-546), his pupil, is credited by Strabo with making the first map of the world, while Diogenes Laertius states that not only did he make a map of earth and sea, but also constructed a globe. According to Agathemerus and Herodotus, Hecataeus (550-475) of Miletus, who had traveled extensively in Egypt, Persia, Libya, Spain, and Italy, improved, corrected, and greatly extended the map of Anaximander. Thales is reported to have divided the earth into five climatic zones, much as they are recognized to-day, though this is also ascribed both to the Pythagoreans and to Parmenides of Elea (544-430 B.C.), and the latter was said to be the first to assert that the earth was of spherical form and at the centre of the universe. It is probable that Thales was the first to use meridians on a map and possibly the first to draw the equator; he is credited with the discovery that the plane of the ecliptic is inclined to that of the equator and made a rough measurement of the inclination.

Up to the time of Thales, and even later, the world was considered as a plane. Thales, however, is said to have suggested the spherical shape of the earth, and this is probable if he was the originator of the climatic zones; but we are told by Aristotle and Plutarch that, inasmuch as his pupil Anaximander considered the earth to be a disk or a section of a cylinder resting in the centre of the hollow celestial sphere, it is doubtful if Thales held more correct views. Very soon afterward the Pythagorean school of philosophy, if not Pythagoras himself, taught that the earth was spherical, though this hypothesis was based more upon ideas of symmetry than upon known facts. The proof of the earth's sphericity was left to Aristotle (384-322), who drew this conclusion from the shadow of the earth cast upon the sun in eclipses, and though he made no maps of which we have record, he may be said to have founded scientific geography and map making.

Dicaearchus of Messina, a pupil of Aristotle, constructed maps of Hellas and is said to have estimated the size of the earth on an oval map of the world he constructed. He is supposed to have been the first to draw a parallel of latitude on a map, such a line having been derived and drawn on his map from observations of the length of the shadow cast by the sun.

The first attempt to measure the actual size of the earth was made by Eratosthenes (c.275-195), from whom scientific geography may be said to date. (See ERATOSTHENES.) Appointed keeper of the Alexandrian Library by Ptolemy Euergetes in 245, he started his map making by determining the difference in latitude between Alexandria and Syene by measuring the shadow of the sun as cast by a gnomon or pillar at each

place on the same day, and then after computation determined in linear measure the length of the corresponding arc of meridian. He determined the latitude of Alexandria, Syene, and Meroë, through which he traced his initial meridian. He obtained the distance between Alexandria and Syene from maps made by Egyptian royal surveyors, as 5000 stadia, which corresponded to one-fifth part of a circle. From the data thus obtained, he concluded that the length of a degree of latitude was about 700 stadia. Assuming the stadium to have been 164 meters (Dorpfeld), this would give the length of a degree as 114,800 meters (61.9453 modern geographical miles of 6080.20 feet), which is 3992 meters (2.154 geographical miles) in excess of its real value. This difference may have been due in part to the fact that Syene and Alexandria are not on the same meridian or longitude as Eratosthenes supposed; but there was established the earliest system of geographical coördinates which is fundamental to all accurate mapping, either in whole or in detail. Notwithstanding the error, this was an enormous step forward towards accuracy, and the map he prepared from information obtained in the great library was far superior to that of any predecessor.

Crates of Mallus, who died in 145 B.C., was the first to construct a globe which represented the views of the earth held by the Stoic school of philosophy. In this the symmetry ideas of the Pythagorean school are found carried still further. Since land exists on both sides of the equator, he concluded that the known continent of Europe, Asia, and Africa must be balanced by another on the opposite side of the world. The resulting globe had an equatorial ocean and a meridional one, the two dividing the world into four parts each containing an inhabited continent. On this globe the existence of such continents as North and South America and Australia was anticipated. As showing the effect of this arrangement in modes of thought it may be said that such a globe so divided by bands early became typical as one of the insignia of royalty.

Hipparchus of Rhodes (fl. c.160 B.C.) compiled no maps, but his labors in the field of geography, astronomy, and mathematics were most important and helpful to map making. On the strength of his astronomical knowledge he criticized the work of Eratosthenes, describing its defects and their remedies. He showed the desirability of constructing large maps upon a rectangular projection or plan where the feature of a curved or spherical surface was represented on a plane in such a way as not so greatly to distort the areas at equal distances, devising what are known in map making as the orthographic and stereographic projections, described later in this article. He placed at equal distances the meridians and parallels which Eratosthenes had arranged somewhat arbitrarily, and in order to secure accuracy he showed that the positions of places—both in latitude and longitude—should be determined astronomically; he also pointed out that longitude could be determined astronomically by the eclipses of the sun and moon, instead of being based merely on the itineraries or estimated or roughly measured distances of travelers and sailors, as had been done hitherto. Though he constructed no maps, Hipparchus made a celestial globe which was in the Alexandrian Library in the time of Marinus, 300 years later; and by considering the

earth a sphere and dividing it by great circles perpendicular to the equator and extending to the poles, and by parallel lines at equal distances from the equator to the poles, he not only made geography possible as an exact science, but provided the introduction to modern ideas of latitude and longitude.

During this long period map making does not appear to have progressed, though Strabo (50 B.C.—24 A.D.) added considerably to geographical science and knowledge, and the campaigns of the Romans, of which rough itineraries or crude maps were prepared, gave much information in regard to regions previously unknown. A military map of the Roman provinces was made under the order of Julius Cæsar by three surveyors, who began their work in 44 B.C. and continued it for 25 years. Such military maps and the itineraries of travelers, however, must be considered at their face value, for they did not represent places in their relative distances, as would a map based on latitude and longitude. Thus, in the Peutingerian Table, a Roman *itineraria picta*, in one of the oldest surviving mediæval maps, now in the Royal Library in Vienna, there is seen a thirteenth-century copy of an old Roman original showing the Roman world at the time of Theodosius (393 A.D.). It is some 18 feet in length and more than 1 foot in breadth, embracing the region from Spain to India. See ITINERARY; PEUTINGERIAN TABLE.

But, returning to more scientific maps, mention next may be made of the work of Marinus of Tyre (c.120 A.D.), which is known from the description furnished by Ptolemy. Marinus, who studied the work of his predecessors and all other accumulated geographical data, was the first to determine the geographical positions of places on his map by using a projection or plan based on their latitudes and longitudes. This plan was not really a projection as understood by modern geographers, as it had the parallels and meridians equidistant and at right angles; and as the relative lengths of the degrees of latitude and longitude were based on a central parallel for which the latitude of Rhodes was taken, regions to the north and south naturally were distorted both in area and shape. The errors of this chart were even further increased by his adopting the length of a degree of latitude, 500 stadia, as determined by the Stoic geographer Posidonius, instead of accepting the more accurate determination of 700 stadia made by Eratosthenes.

Claudius Ptolemy of Alexandria (c.190–270 A.D.) was one of the greatest geographers, astronomers, mathematicians, and map makers of all times; and fortunately most of his work, both the maps and the indexes of places, has come down to us, but only in copies with doubtful authentication. His knowledge of geography, astronomy, and mathematics eminently fitted him for map making, which was one of the least of his achievements, important as it was. He made maps largely by compilation, editing the work of previous geographers and particularly correcting many errors of Marinus and to a large degree the distortion of his maps. He also furnished descriptions of them with tables of geographical positions of places, so that the maps could be reproduced by others having copies of the original data, and in fact this was done extensively.

Ptolemy was responsible for two projections—one a modified conical, where the parallels were

curved and the meridians straight, and the other also a modified conical, but having both parallels and meridians curved—both being seen in his maps of the world. In the first projection he preserves the correct relations between latitude and longitude at the equator and the extreme northern limit of his chart (latitude of Thule or the Hebrides). In the second plan he preserves the correct relations at the northern (Thule, about 65 degrees north) and southern (Agisymba, 20 degrees south) limits, at the equator, and at the parallels of Morôë (about 15 degrees north) and Syene (about 25 degrees north). Ptolemy's small maps, 26 in number, according to the oldest extant edition of 1478, are drawn upon a simple rectangular projection, their moderate areas not requiring the curve of the meridians or parallels to secure adequate accuracy.

Ptolemy's maps as planned and executed by him were a great advance upon those of his predecessors, but unfortunately he, like Marinus, followed the estimates of Posidonius instead of the more exact measurements of Eratosthenes as to the size of the earth, using 500 stadia as the length of a degree of latitude instead of 700. The known world was therefore unduly expanded in longitude (and at some places in latitude) on Ptolemy's charts, the east coast of Asia being shown to extend so far to the eastward as to place it 9000 miles or less from the west coast of Europe. Ptolemy's work, after being neglected for centuries, was revived in the fifteenth century, and his maps were known, copied, and extended. These maps were known to and studied by Columbus, and the comparative shortness of the distance from Europe to Asia was one of the reasons which led him to believe he could successfully reach China by sailing westward. While Ptolemy's work was of great value at this time, yet mariners and geographers, aided by geographical discovery during the fifteenth and sixteenth centuries, realized that the errors were both fundamental and detailed, so that his authority became undermined with the development of the more modern cartography.

Soon after the death of Ptolemy there came an end to nearly all development of science in the Christian world. The Church at this time included in its domain science as well as all other forms of learning, and the fathers, such as St. Augustine, then such theologians as Thomas Aquinas and the popes regarded the Bible as the sole repository of wisdom, scientific as well as spiritual, and adhered blindly to a literal interpretation of its text. The bishops of Alexandria destroyed the rehabilitated Alexandrian library and the Serapeum and scattered the priceless records of previous scientific achievement. For a thousand years now the intellectuality of the Christian peoples reverted to the beliefs antedating the rise of Greek philosophy; geography and map making suffered with other branches of science. The clear and intelligible maps and scientific methods of Ptolemy were neglected and forgotten for a thousand years, and instead there were put forth grotesque and fanciful representations of land and water which form all the commentary necessary as to the intellectual state of the times. Some were rectangular, some circular, all consisted of fancifully shaped land surrounded by the "circumfluent ocean." Many contained fantastic figures of princes and scriptural characters as well as legendary beasts and

monsters. The map still in existence in the cathedral at Hereford, England, and dating from 1283, is interesting as indicating an increasing knowledge of geography at this time while still preserving many of the absurdities of the patristic period.

Thus the Christian world—not so the Mohammedan. As soon as the blind fanaticism and fury of their early conquests were spent, the various Mohammedan rulers encouraged science, literature, and commerce. They sought learning and philosophy wherever it was to be found, and much that has survived of the work of Aristotle, Ptolemy, and of other Greeks and Egyptian learned men has come down through them. Moreover, they developed and greatly improved and practicalized the science and information they received. Among the many things with which they dealt were charts and maps, which they made more correct and more common.

Among the most important developments of this period were the so-called compass maps which were attached to the portolani or books of sailing directions for mariners trading in the Mediterranean. The distinguishing feature of these charts was a great number of lines radiating from one or more centres. The exact use made of these lines is uncertain, but it may be that they served to show the general directions of places from each other. As they were drawn without regard to land and water, they did not show practicable routes for vessels; and as they seem to have been common before the introduction of the compass, they were not designed for use with it. The origin of the portolani charts is unknown, but they show that much advance had been made in accuracy of knowledge concerning latitude and longitude since the days of Ptolemy. Some of these charts were more ambitious and covered as much of the earth as was known, and we know that one by Toscanelli, made about 1474 on the basis of the travels of Marco Polo, was sent to Columbus.

The discovery of America aroused interest in science and secular learning and caused a general skepticism as to previously accepted facts and a distrust of the hitherto accepted ideas as to astronomy, cosmogony, and geography. For nearly 1500 years science and the Church had been in opposition, and naturally this extended to map making. The Spanish conquistadores found that the Peruvians had ordinary maps and maps in relief, while the Mexicans had cadastral plans of villages and towns and a map of the coast; but the Spanish Conquest put an end to all development in that part of the world.

The discovery of America, which continent first appeared in the Waldseemüller map of 1507 and in Ruysh's map of 1508, upset views as to the shape of the earth, but the Church allowed the facts to spread but slowly and opposed the ideas of Copernicus and Kepler, but the truth necessarily prevailed in time. The result was a great impetus towards exploration and map making. The works of Ptolemy, Hipparchus, and Eratosthenes were again considered, especially in view of the fundamental principles upon which the work was executed, and maps began to be constructed upon real projections and with more attention to collecting the results of explorations. The map of the world made by Gerhard Kremer (Mercator) in 1569 is by far the best produced up to that time. Its principal errors are the undue width of North America and an extension of the Antarctic continent too

far to the northward—so far indeed as to connect it to Australia, of which the southern coast was then unknown. Mercator's charts were engraved on copper and were among the first in which reproduction by this method was employed.

FIG. 1. ORTHOGRAPHIC PROJECTION.
Showing lines of projection.

Since the time of Mercator the development of map making has continued without a break, not only as regards scientific improvement of the projections and of the methods of reproduction but also as regards accuracy of delineation and of geographic positions, which has been rendered possible by the extension of geographic knowledge and the perfection of modern surveys. Map making has also been extended to cover geological, meteorological, and other terrestrial phenomena; to show elevations or depressions in the earth's surface by variations in color, contour lines, and maps in relief; and to exhibit by suitable means the mineralogical character of the earth's crust or its magnetic forces.

Most civilized countries now are quite accurately and more or less completely mapped on a large scale, the first attempt in this direction being made in 1733 by Cesar Cassini, the director of the astronomical observatory at Paris. Assisted at first by the French Academy of Sciences and afterward by a private company, he

FIG. 2. ORTHOGRAPHIC PROJECTION.

undertook to map the entire area of France. The first sheets appeared in 1744 and the last were completed in 1793. The work aroused widespread interest in all civilized countries and so forcibly illustrated the value of accurate maps that the French government undertook an elaborate survey, an example that has been generally

followed in Europe and America. In the United States the map-making establishments are the Geological Survey (q.v.), which is bringing out topographical and geological maps of the whole country, the Coast and Geodetic Survey (q.v.),

FIG. 3. STEREOGRAPHIC PROJECTION.

On the plane of a meridian and on a tangent plane, showing lines of projection.

which publishes charts of the coast and harbors, and the Hydrographic Office (q.v.) of the Navy, which publishes charts of the Great Lakes and of the oceans, coasts, and harbors of the world beyond the limits of the United States.

The number of types of projection used in the official and private maps of the different countries, as well as the difference in scales, nomenclature, symbols, character of information presented, etc., has caused much trouble to geographers, map makers, engineers, educators, and others throughout the world. Several international conferences have been called to consider the various geographic and constructional questions of general interest. The conference of 1909 took place in London. The United States and the principal European nations were represented. Among other matters decided upon was the con-

desired area. The work is in progress in all countries which were represented at the conference and in some others which have since acceded to the plans. It was hoped that the map would be completed about 1920.

Relief maps are frequently made to show the topographical features of a country, district, watershed, canal, river, mountain range, etc. If the scale is small the altitudes are usually exaggerated in order to give a clearer appreciation of details. When the scale is large this is not so necessary. Some relief globes have been made, but they are not common except for instruction of the blind.

Theory of Map Construction. As the earth is a spheroid, it is impossible exactly to represent it, or even a small portion of it, upon a plane surface. In order to represent parts of it upon

FIG. 6. GNOMONIC PROJECTION.

On plane tangent at the pole.

a plane with as little distortion as practicable, maps are prepared according to various systems of construction called projections. There are three classes of maps: (1) those made by perspective projection upon a plane, (2) those perspective projected upon a curved surface of

single curvature, such as a cone or cylinder, and the resulting projection developed (i.e., rolled out) upon a plane, and (3) arbitrary constructions. All are commonly termed projections, though only the first has any right to the designation (and even that is not a normal projection), while the third has no real claim to the title.

Projections of the first class may be divided into three groups—internal, surface, and external—depending upon the position of the point of sight, which may be inside, on the surface of, or outside the sphere. The only internal projection of importance is the gnomonic, and the only surface projection is the stereographic. The external projections are the orthographic, globular, Clarke's, James's, La Hire's, Parent's, etc. The developed projections are the simple conical and the cylindrical. Mercator's is sometimes placed in this class, but this is incorrect. The arbitrary constructions include Mercator's and a vast number of others designed for various uses.

In the central or gnomonic projection the eye

FIG. 7. GLOBULAR PROJECTION.

Showing meridians and parallels of latitude 10° apart.

is supposed to be at the centre of the earth and the plane of projection tangent to the surface—usually at the equator or about 30° north or south latitude. As the planes of all great circles pass through the centre of the sphere, they are projected as straight lines. All lines of sight on the earth and the path of the shortest distance between two points are shown as straight lines. Within 3° from the point of tangency of the projecting plane both distances and angles are quite accurately projected, but beyond 3° the errors increase rapidly. At 60° from that point the distortion is very great. This projection is suitable for surveying sheets and maps of moderate area and for charts of large area designed to give great-circle courses, tracks, and distances. See NAVIGATION.

In the stereographic projection the eye may be placed at any point in the surface of the sphere; the projection is made on any plane perpendicular to the diameter passing through the eye. The usual planes are the one which is tangent to the sphere at the opposite end of the diameter and the plane of the great circle of which the eye is the pole. In a sphere both

angles and shapes are projected in their true form, but in a spheroid this is not so, and the difficulties connected with the computations have prevented extensive employment of this projection in exact mapping of the earth.

The external projections are numerous, as there are certain advantages to be gained by selecting particular distances beyond the surface for the point of sight. The type most commonly used is the orthographic in which the eye is assumed to be at an infinite distance and the projecting lines are parallel and perpendicular to the plane. In Clarke's projection the distance of the point of sight is variable and is adjusted to the area in such a manner as to give the minimum deformation. In Parent's projections the distances from the centre of the sphere are 1.595 and 1.732 times the radius,

the ones most commonly used. The different forms are designed to afford certain advantages—equivalent areas, similar shapes, equal angles, equal distances, great-circle routes, simplicity of construction, minimum errors of area, shape, angles, distances, etc., suitability for surveying purposes, for navigation, for representation of large areas, etc. Projections in which very small figures, angles, etc., are represented in the same shape as on the earth are called orthomorphic; those in which equal areas of the sphere are shown as equal (but perhaps slightly deformed) areas in the projection are called equivalent or equal-area projections; equidistant projections are those in which the distances, measured in certain directions, are the same as on the sphere.

The simplest form of the arbitrary projection is the ordinary globular. In a hemisphere on

FIG. 8. A MERCATOR'S PROJECTION.

while in La Hire's the distance is 1.707 times and in James's 1.5 times.

The developed projections are the simple conical and the cylindrical. In the conical the cone is tangent to the earth along some circle of latitude and the projection is perspective with the eye at the centre of the earth or where the normal cuts the minor axis. After receiving the projection the imaginary cone is supposed to be cut along one of its elements and rolled out flat upon the paper. The meridians are evidently straight lines and the parallels concentric circles. Near the circle of tangency the distortion is small, but it rapidly increases beyond a distance of 3° in latitude. In the cylindrical projection the points on the earth's surface are projected upon the cylinder by normals to the common diameter of the sphere and cylinder. The cylinder is supposed to be cut open along an element and rolled out flat on a plane. Cylindrical projections are also made perspectively with the eye at the centre of the sphere. The Mercator is popularly supposed to be developed in this way, but that is not so.

The arbitrarily constructed projections are

this projection the boundary is a great circle; the equator and central meridian are shown as straight lines. The other meridians are arcs of circles passing through the poles and cutting the equator at equidistant points; and the parallels of latitude are arcs of circles which divide the bounding meridian and the central meridian into the same number of equal parts.

Nearly all the other arbitrary projections of importance make use of an imaginary cone or cones in the construction, or may be regarded as modifications of conical projections. In the true conical projections the meridians are straight lines and the parallels are arcs of circles. In the polyconic the central meridian and equator are straight, other parallels and meridians are curved. In the modified conical either the meridians or the parallels are curved or they are both curved.

The most important of all projections is the Mercator. It may be regarded as constructed upon a cone of definite base (the equatorial great circle) and infinite altitude—in other words, a cylinder. The popular idea of this projection is that it is of the perspective type,

projected upon a cylinder tangent to the earth at the equator, the eye being at the centre of the earth; and that the projection so formed is developed by cutting along a meridian and rolling it out upon a plane surface. Such is not the case. The total extension of the meridian from 0° to 60° of latitude is only about 25 instead of 65 per cent as given by a perspective projection.

In sailing upon a fixed compass course this course necessarily cuts all meridians at a constant angle. The path of a ship so steered is not a straight line but a curve called a *rhumb line*. (See SAILINGS.) The rhumb line joining two points never exactly coincides with the great circle passing through them except when they are both on the equator or both on a meridian. The divergence between the two increases rapidly with the increase of difference of longitude between the points and with the mean latitude. When the points are 180° apart the great circle evidently passes through the nearest pole and it always lies nearer the pole

tude are published by the United States Navy Department. While the Mercator projection is invaluable for navigating charts it is not well adapted for charts of large areas except when the extent of latitude is moderate or when no part of the area is more than 30° from the equator. In charts of the world or of a hemisphere the relative exaggeration of areas beyond 45° of latitude is so great as to give very wrong ideas as to their extent.

The polyconic projection is quite largely used for surveying sheets and by the United States Coast Survey for nautical charts. For purposes of navigation these charts are not nearly so convenient as those on Mercator's projection, because the ship's track is not a straight line and charts of the same scale and latitude do not match at the edges. The polyconic projection is quite accurate as to distances, angles, and areas within 3° of longitude from the central meridian; beyond 60° of latitude its accuracy is fair throughout. The method of construction

FIG. 9. POLYCONIC PROJECTION.

than the rhumb line. As the rhumb line cuts all meridians at a constant angle, it can only be represented as a straight line on a plane surface when the meridians are represented as straight lines and are parallel to each other; and the angle on the plane can only be equal to that of the sphere or spheroid when the projected latitudes are progressively increased so that the relation between the lengths of a minute of latitude and a minute of longitude at any point of a sphere is the same as that existing between similar lengths on the map.

If w is the distance (on the map) from the equator to any parallel of latitude L ; and if R is the equatorial radius of the earth, M the modulus of common logarithms, and e the earth's eccentricity, then
$$x = \frac{R}{M} \log \tan (45^\circ + \frac{1}{2}L) - R(e^2 \sin L - \frac{1}{2}e^4 \sin^3 L + \frac{1}{8}e^6 \sin^5 L \dots).$$

For the sphere e becomes zero and the second term disappears. To express w in terms of minutes of equatorial longitude, substitute $R = 3437.74677$ and $\frac{1}{M} = 2.30258$. Tables showing the value of x for every degree and minute of lati-

assume a series of cones tangent to the sphere at equidistant parallels of latitude. These cones are rolled out both ways from the central meridian, each base forming a circle with the slant height of the cone as a radius. The successive bases form the parallels of latitude. On these the correct longitude is laid off from the central meridian and the points on adjacent parallels joined to form the other meridians.

One of the most useful projections is the orthomorphic conical projection with two standard parallels. This was devised by Lambert, but is commonly attributed to Gauss. It is of the simple conical type in which all the meridians meet at a point beyond the limits of the map. The correct meridional lengths are laid off along the central meridian. The parallels are circular arcs of large radius. Two parallels (at about one-sixth the total length of the chart in latitude from top and bottom) are selected as standards. The correct spheroidal lengths are laid off on these parallels and the meridians drawn through corresponding points. The other parallels are arcs of circles having the same centre, pass through the correct latitude points on the central meridian, and therefore intercept

the correct lengths on all meridians. This projection is well suited to the representation of the whole northern or southern hemisphere on a single sheet, and is very correct as regards areas, angles, shapes, and distances for a range of 40° in latitude and fairly so for a range of

FIG. 10. BONNE'S PROJECTION.
Lat. 90° , long. 180° .

60° . It is particularly well suited for maps of smaller areas.

If for two standard parallels we substitute one, we get the simple conical projection. This has no particular merits, its range of accuracy being confined to a narrow belt of latitude on each side of the standard parallel.

Bonne's projection is much used in geographies and atlases. It is a modified conical. The central meridian is a straight line on which are laid off the correct spheroidal distances between parallels. The parallels are arcs of concentric circles. One of them is selected as the standard and this is struck with a radius of $p \cot L$, in which p is the length of the normal to a meridian (which is an ellipse) intercepted between the circumference and the minor (polar of the sphere) axis and L is the latitude of the parallel. The other parallels are struck with the same centre and intercept correct intervals of latitude on the central meridian. On each parallel are marked the correct distances between meridians as derived from the spheroid. The

FIG. 11. MEXICO ON A CONICAL PROJECTION.
With rectified meridians and two standard parallels.

corresponding points are connected to form the meridians of the map. Bonne's projection is an improvement of one of Ptolemy's. It is an equal-area projection and is suitable for maps of not more than 120° of longitude and on one side of the equator; beyond 60° from the central meridian the distortion of shapes is considerable.

The sinusoidal or Flamsteed's projection is

similar to Bonne's in construction except that the parallels are straight lines perpendicular to the central meridian. It also is an equal-area projection. It is suitable for a map of 180° of latitude and 120° of longitude; indeed it is probably the best of all projections for showing a hemisphere. No projection can show the whole world in a continuous projection without enormous distortion of polar areas.

Zenithal projections may be perspective (all perspective projections are zenithal) or arbitrary. A point is selected for the centre of the map. All planes passing through this centre and the centre of the sphere cut straight lines in the projection and great circles in the sphere. The points of the sphere are laid out on the corresponding lines of the projection at distances depending upon the law of the particular projection. If perspective, with the eye at the centre, we get the gnomonic; if the eye is in the opposite surface, the stereographic. Aside from these and other zenithal projections already described or mentioned, only two are very useful. One is the *equidistant zenithal* and the other the *equal-area zenithal*. In the equidistant zenithal the true lengths of the spheroidal arcs are laid off on the corresponding lines of the projection; in the other the lengths are so proportioned as to give equal areas. A third projection is Airy's, in which the errors of distance, shape, and direction are balanced so as to make them as small as possible in each direction without increasing them unduly in others. Zenithal projections are adapted to the representation of fairly large areas in any part of the world, but are chiefly (except as regards the gnomonic) employed in polar charts.

The projection selected for the International Map of the World is a modified polyconic. Each sheet is plotted independently on its central meridian, which is a straight line marked off in degrees in a manner hereinafter explained. Through the points so marked circles are drawn to represent the parallels. The centres of the circles are on the prolongation of the central meridian, and the radius of each circle is $N \cot L$, in which N is the length of the normal intercepted between the curve and the minor (polar) axis of the meridional ellipse and L is the latitude of the parallel represented. Along the limiting parallels of each sheet (i.e., the circles at the top and bottom) the degrees of longitude are laid off in their true length to scale. Corresponding longitude points on the limiting parallels are joined by straight lines which represent the meridians. The meridians which are true to scale are those which are 2° to the east and west of the central meridian. The actual lengths on the central meridian are true to scale minus the small correction necessary to effect the adjustment, and this is given in a special table.

Practical Construction. The surveys (see SURVEYING; HYDROGRAPHY) having been completed, the results are transferred to the base map on a suitable projection; errors and discrepancies are eliminated or reconciled, and if certain localities need additional examination this is made. From the base maps and the original data drawings for the final map are prepared on the predetermined scale. In some cases it is practicable to obtain the suitable working plans by photo reduction from the base maps.

To facilitate projection of points, areas, me-

HYDROGRAPHY: (Figures over dotted areas show depths in feet, others in fathoms.)

ridians, parallels, etc., tables have been prepared for all the principal projections, and these obviate the necessity for computation. After the working drawing is completed the maps or charts are prepared for reproduction by engraving them on plates, etching them on plates, or by photolithography. The engraved plates (copper or soft steel) give the best results, but are more costly; the etched plates are prepared by photographing on copper plates and etching with acid. The photolithographed charts are by far the cheapest, but are necessarily printed on inferior paper and will not stand much use.

The map shown upon the accompanying plate has been designed to illustrate the methods of delineation employed by the Coast and Geodetic Survey, the Geological Survey, and the Hydrographic Office of the Navy. The Geological Survey maps give certain additional data, as do some of the charts published by the Hydrographic Office.

MAP, or MAPES, WALTER. A mediæval author, of Welsh descent, born probably in Herefordshire, England, about 1140. He studied in Paris from about 1154; was connected with the household of Henry II, whom he attended abroad; was sent on missions to Paris (1173) and Rome (1179); and was precentor of Lincoln, incumbent of Westbury, Gloucestershire, prebend of St. Paul's, and Archdeacon of Oxford (1197). He died about 1209. Map's one undoubted work is *De Nugis Curialium* (The Triflings of Courtiers), a curious and interesting medley of anecdotes, reminiscences, and stories, to which we owe most of our knowledge of Map's life. In several of the manuscripts of the prose *Lancelot, Grail*, and *Morte d'Arthur* his name occurs as the author. But recent scholarship places them at a later date. With some doubt the Goliath poems are ascribed to him, satires in Latin on the clergy. Map was especially a foe of Jews and Cistercians. In this collection occurs the famous drinking song "Mihi est propositum in taberna mori," which was rendered into English by Leigh Hunt. Consult the *Latin Poems Attributed to Map* and *De Nugis Curialium*, edited by Wright, Camden Society (London, 1841, 1850), and Bardoux, *De Waltherio Mappio* (Paris, 1900).

MAPLE (AS. *mapol*, *mapul*, *mapel*, Icel. *mopurr*, OHG. *mazzaltra*, *mazzoltra*, Ger. *Mas-holder*, *maple*), *Acer*. A genus of trees of the family *Aceraceæ*, containing nearly 100 species, natives of north-temperate regions, especially abundant in North America and eastern Asia. They have opposite, lobed, or palmate leaves without stipules; flowers in small axillary racemes or corymbs, rich in nectar, and attractive to bees; fruits, two small winged nuts, one or two seeded. With a few exceptions the entire order is embraced in the genus *Acer*. The best-known European species are *Acer campestre* and

MAPLE LEAVES.

1, European maple (*Acer campestre*); 2, striped maple (*Acer pennsylvanicum*); 3, sugar maple (*Acer saccharum*); 4, out-leaved form of Japanese maple (*Acer japonicum*, var. *dissectum*).

Acer pseudo-platanus. The common maple (*Acer campestre*), a shrub or small tree seldom attaining a height of 50 feet, is a native of many parts of Europe and Asia. Its wood is hard, fine-grained, takes a high polish, and is much used by turners and for carved work. The greater maple, sycamore, or plane tree of Europe (*Acer pseudo-platanus*) is extensively planted both in Europe and in America. It is a large tree with a spreading head, 70 to 90 feet tall, of rather

quick, vigorous growth. Its wood, which is white, compact, moderately hard, receives a fine polish and is much used by wheelwrights, turners, etc. Sugar is sometimes made from the sap.

The Norway maple (*Acer platanoides*), a native of Europe, is commonly planted in the eastern United States and elsewhere as a shade tree. It grows to a height of 100 feet and has a compact, round head that renders the shade very dense. It is by some preferred as a shade tree to the sugar maple, which it resembles.

Among the American species perhaps the best known is the sugar maple (*Acer saccharum*), a large tree, 90 to 120 feet high, and found from Newfoundland to Georgia and westward to the northern shores of the Great Lakes, eastern Nebraska, and Kansas. The wood has a satiny appearance and is extensively used in cabinet-work and finishing houses. When the grain has a pronounced wavy appearance the wood is called bird's-eye maple and is used as veneer. From the sap of this tree large quantities of sirup and sugar are made. To obtain the sap, holes are bored into the tree for half an inch or more in the late winter or early spring. The sap, caught in vessels, is evaporated until the residue becomes sirupy or until a yellowish or brown sugar is obtained. Trees will yield from two to six pounds of sugar during a season, and if the tapping, as it is called, is properly done, the tree suffers little injury. The black maple (*Acer nigrum*), now regarded as a variety of *Acer saccharum*, is also an abundant producer of sugar. The tree is of similar habit and range to the former, and is distinguished from it by its black bark and generally duller appearance. The silver maple (*Acer saccharinum*, formerly known as *Acer dasycarpum*) is a large, rapidly growing tree of the same range as the last. It is an ornamental tree, with light, brittle wood, and is extensively planted as a shade tree, but, aside from its rapid growth, is not equal in this respect to the sugar maple. The tree is very

RED MAPLE.

a, staminate flowers; b, pistillate flowers.

saw. Sugar is made from it, but the sap is less sweet than that of either of the two species most commonly tapped. The striped maple (*Acer pennsylvanicum*) is a small tree with greenish bark striped with white lines. Its compact habit of growth and large leaves make it an excellent shade tree. The red maple (*Acer rubrum*) has about the same range as the sugar maple. It somewhat resembles the silver maple in habit, but is of slower growth. Its timber is valuable, and the spring coloring of the flowers and fruits and the autumn coloring of the leaves make it a very ornamental tree. The mountain maple (*Acer spicatum*), a small tree in the eastern United States, the large-toothed or Oregon maple (*Acer grandidentata*), and the vine maple (*Acer circinnatum*) of the Rocky Mountains and Pacific coast are other common and well-known species possessing the habits and uses described above. All of the species are valuable for fuel, in this respect exceeding all other woods except hickory in popular estimation. Of many of the species there are numerous cultivated varieties differing in their habit of growth, color and character of foliage, etc. The autumn coloring of the maples, especially in the United States, is not surpassed by any other group of trees, the reds and yellows of their leaves adding greatly to the beauty of the autumn landscape.

Among the species of eastern Asia are a number that have been introduced into western countries, and some have proved valuable for planting, such as the famous Japanese maples, most of which are varieties of *Acer palmatum* and *Acer japonicum*. They are mostly small trees or shrubs, and on account of their great variety in color and the deep and often curious lobing of their leaves, they are extensively planted as ornamentals.

One section of the genus *Acer*, sometimes called ash-leaved maples, have compound leaves. There are representatives of this group in Japan and in the United States, the best known of which is *Acer negundo* (*Negundo aceroides*), the box elder (q.v.), coming to be a very common shade tree along streets.

MAPLE, FLOWERING. See **ABUTILON**.

MAPLE, SIR JOHN BLUNDELL, BARONET (1845-1903). An English capitalist. He was educated at Crawford College and at King's College School. In 1862 he entered his father's furniture business, of which he was practically the head after 1880. The firm developed rapidly, and in 1891 it was changed into a limited liability company with £2,000,000 capital. Maple was a Conservative member of Parliament for Dulwich from 1887 until his death; was knighted in 1892; and was created Baronet in 1897. The owner of a large stud of blooded race horses, he won 544 races in 21 years with his entries, many of which were made under the name of "Mr. Childwick." He rebuilt University College Hospital, London, and left a fortune of £2,153,000.

MAPLE INSECTS. The different species of maple are greatly subject to the attacks of injurious insects, certain species, such as the silver-leaved maple, being more susceptible than others. Several insects bore in the trunks of these trees. The sugar-maple borer (*Glycobius speciosus*), a black, long-horned beetle which has yellow bands, destroys the sugar maple in the northern parts of the United States; the horntail borer (see **HORNTAIL**) and the larva of a clear-winged moth (*Algeria acerni*) also bore

RED MAPLE (*Acer rubrum*).

Spray with fruits.

hardy and easily grown, but on account of its brittleness is especially liable to damage by winds and storms breaking its limbs. This species was named *Acer saccharinum* by Linnaeus under the impression that it was the true sugar maple, a tree which it is now believed he never

MAPLE

1. Tree in Bloom.

SUGAR MAPLE (*Acer saccharinum*).

2. Tree in Full Leaf.

the trunks, the latter being especially abundant in the Mississippi valley. A buprestid beetle, *Dicerca divaricata*, in the larval stage bores in red-maple stumps, although undoubtedly originally an enemy of the beech. The principal bark borer of the sugar maple in the northern United States is *Corthyli punctatissimus*, one of the Scolytidæ. The striped maple worm (larva of *Anisota rubicunda*) is a widespread enemy of these trees, frequently feeding upon the leaves in such great numbers as entirely to defoliate long rows of shade trees. The tent caterpillar of the forest (*Malacosoma disstria*) is a decided enemy of all species of maples and has greatly damaged the sugar maples in New York and New England. The tussock moth's caterpillar (*Orgyia leucostigma*) and the fall webworm (*Hyphantria cunea*) frequently defoliate the shade trees of the larger cities. The cottony maple scale (*Pulvinaria innumerabilis*) is occasionally so numerous as to cause serious injury, and another scale insect (*Pseudococcus aceris*), probably introduced from Europe, is very abundant on the shade trees of certain cities. The so-called gloomy scale (*Aspidiotus tenebriococcus*) has a southern range, and is frequently the unnoticed cause of the death of otherwise vigorous shade trees. Several species of plant lice, notably *Pemphigus acerifolii*, damage the leaves of early summer, and a gall mite (*Phytoptus quadripes*) disfigures the leaves with its massed reddish galls. Consult A. S. Packard, *Fifth Report of the United States Entomological Commission* (Washington, 1890), and publications of the United States Bureau of Entomology, especially the *Circulars* (ib., 1900 et seq.).

MAPLESON, mǎ'p'l-son, JAMES HENRY (1829-1901). An English operatic impresario, born in London. He studied the violin for two years at the Royal Academy of Music and then went to Italy for singing lessons; but soon after his return a throat affection made a vocal career out of the question, and he was engaged in the orchestra at Her Majesty's Theatre. After having made tours with several leading artists, in 1861 he succeeded E. T. Smith as manager of the Italian opera at the Lyceum in London. He controlled Her Majesty's Theatre (1862-69), and then went to Drury Lane until 1877, when he returned to Her Majesty's, and the following year he brought Italian opera to the United States. He was successor to Strakosch at the Academy of Music in New York City and introduced many of the greatest singers of his time to New York audiences. In 1888 he published his reminiscences in two volumes under the title *The Mapleson Memoirs* (Chicago).

MAPLE SUGAR. See SUGAR.

MAPLEWOOD. A city in St. Louis Co., Mo., adjoining the city of St. Louis on the west, and served by the Missouri Pacific Railroad. It is essentially a residential suburb of St. Louis. Pop., 1910, 4976.

MAPS AND MAPPING. See GEODESY; MAP.

MAP TURTLE. One of the names of a common North American land turtle (*Malacoclemmys geographicus*), also called geographic tortoise.

MAPU, mǎ'pōō, ABRAHAM (1808-67). A Russian Hebrew novelist. He was born in a suburb of Kovno and achieved a reputation as a Talmudist by the time he was 12. A Latin psalter falling into his hands, he set about studying Latin

with intense interest, and under the guidance of a friendly Polish curate made rapid progress. This opened the way for the study of the Latin classics, which left an indelible impression on Mapu's poetic nature. A knowledge of French, which he acquired next, introduced him to the French romanticists, with whose works—and especially the novels of Eugène Sue—he became infatuated. In 1848, having secured an appointment as teacher in a Jewish government school in Kovno, he came in touch with Senior Sachs, who inspired him with new enthusiasm for Hebrew literature and urged him to devote himself to it. The result of this advice and encouragement was the completion of a novel, *Ahabat Zéyon* (The Love of Zion) (1852), conceived some 20 years before. As this historical romance was the first of its kind in Hebrew literature, its importance cannot be overestimated. It recalls in glowing colors the golden age of ancient Judæa. In spite of its puerile technique and crude psychology this work had an immense success. While strictly orthodox rabbis condemned *The Love of Zion* as a profanation of the holy language, their students everywhere were entranced by its poetry and sentiment. Mapu's next work, *The Transgression of Samaria* (1865), is another historical romance dealing with the same period as the first and written in noble biblical style. Both have been translated, under various titles, into German, English, and Yiddish. A third historical romance was all but destroyed by the Russian censorship. Mapu's last and longest novel, *The Hypocrite* (1859-69), fell far short artistically of the earlier ones. Besides these, Mapu wrote also an excellent manual of Hebrew (containing suggestions for teaching it), a Hebrew grammar, and a Hebrew textbook for the study of French.

MAPURITO, mǎ'pōō-rě'tō. See CONEPATE; SKUNK.

MAQUET, má'ká', AUGUSTE (1813-88). A French author, born in Paris. He was educated at the Collège Charlemagne, where he was for a time teacher. Having written the drama *Bathilde*, he was introduced to Alexandre Dumas, who, impressed by his talent, proposed their working together. It has generally been admitted that in this capacity of collaborator he furnished large portions of Dumas's most famous books and plays. Under his own name he published the romances *Beau d'Angennes* (1843), *La belle Gabrielle* (1853-55), and many others. For the theatre he prepared *Le château de Grantier* (1852), *Le comte de Lavernie* (1855), *La belle Gabrielle* (1857), and a number of others.

MAQUI, mǎ'kwě (Sp. *maqui*, from the Chilean name), *Aristotelia macqui*. One of a few species of a genus of plants sometimes referred to the family Elæocarpaceæ, a Chilean evergreen or subevergreen shrub of considerable size. The small green or yellow flowers, borne in axillary racemes, are followed by three-celled edible black acid berries about the size of peas, which are used by the Chileans to make wine. The wood is used for making musical instruments, and the tough bark for instrument strings. The maqui is frequently cultivated as an ornamental shrub, and in favorable conditions sometimes bears fruit in northern countries.

MAQUI. A peculiar type of xerophytic thicket characteristic of the Mediterranean region of Europe. The plants are chiefly evergreen shrubs and half shrubs and comprise a

large number of well-known plants, such as the myrtle, box, laurel, and oleander. It is similar in appearance to the *chaparral* found in the southeastern United States, which is composed of dwarf evergreen oaks together with various shrubs of the buckthorn and rose families. See THICKET; CHAPARRAL.

MAQUOKETA, mǎ-kō'kê-tā. A city and the county seat of Jackson Co., Iowa, 38 miles by rail northwest of Clinton, on the Maquoketa River and on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads (Map: Iowa, G 2). It has a Boardman reference and a Carnegie library, a sanitarium, and Ellisonian Institute. Maquoketa is a trade and industrial centre of considerable importance, its manufactures including lime, flour, foundry and machine-shop products, brick, lumber, cigars, butter tubs, etc. In the vicinity are valuable quarries of limestone. The water works are owned and operated by the municipality. Pop., 1900, 3777; 1910, 3570.

MAR, EARL OF: See ERSKINE, JOHN (1675-1732).

MARA, mǎ'rā, GERTRUDE ELIZABETH SCHMELING (1749-1833). A German singer, born at Cassel. She began to play the violin at such an early age that her father, a poor musician, gave her a few lessons and then exhibited her as a prodigy in Vienna and London. In the latter city she took a few singing lessons from Paradisi and was so successful that thereafter she devoted herself entirely to vocalization. Her first engagement was at Leipzig; she then sang at the Dresden Court Opera, and in 1771 accepted an engagement for life at the Berlin Court Opera. In Berlin she married the violoncellist Mara, who squandered her fortune. In 1780, owing to a series of annoyances, she broke her contract and went to Vienna, and from there, in 1782, to Paris, where her great rivalry with Todi (q.v.) became an historic event, and the French public was divided into "Maradists" and "Todists." With the exception of two visits to Italy, she spent the period from 1784 to 1802 in England. Upon leaving London she went to Paris and then, after an extensive tour, to Russia, where she lost her property at the time of the French invasion. Her voice had now failed her, and she became a singing teacher at Reval, where she died in great poverty. Consult Arnold Niggli, *Gertrud Elisabeth Mara* (Leipzig, 1881).

MARABOU (mǎr'ā-bōō') **STORK** (Fr. *marabout*, Sp. *marabú*, from Ar. *murābiṭ*, hermit, from *rabata*, to bind). The African name of a stork allied to the adjutant (q.v.) or argala of India. Both species belong to the genus *Leptoptilus*, which is remarkable for having the feathers of the anal region lengthened so as to conceal the true tail feathers, and these elongated feathers are the so-called marabou feathers which were formerly much used for trimming ladies' hats and dresses. The African species is *Leptoptilus crumeniferus*. It is white with the back and wings greenish slate color. The sausage-like pouch which hangs from its neck is capable of being inflated, giving the bird a strange appearance. It is gregarious in its wild state, frequenting the mouths of rivers and living upon animals too large for other storks to swallow. It is easily domesticated, but its exceeding voracity impels it on every occasion to purloin poultry, cats, and puppies, swallowing them whole.

MARABOUTS, mǎr'ā-bōōts'. The French

form of the name of a Mohammedan sect, from which sprang the Almoravides (q.v.), who founded a dynasty in northwest Africa and in Spain during the eleventh century. In Arabic the term *al Murabituna* (the hermits) is derived from *ribat*, which designates a hermit hut and a fortified place, but came to be a name of not only the hermits themselves, but also of those who joined them in establishing the new dynasty. The descendants of the original ascetic missionaries form to-day a sort of order among the Berbers, leading a sanctified and contemplative life, though the appellation Marabout is generally given them only after their death. They are the western counterpart of the eastern *Mujāhid*, who, suppressing the passions, seeks union (*Ittikād*) with Allah, and of the saints (*wālis*) of the Sufis. They are often attached to mosques, chapels, or places of pilgrimage, explaining the Koran and providing the faithful with amulets. As their influence is very great, their orders are implicitly obeyed. There are various divisions among them; the higher Marabouts living in a sort of monastery (*Zāwiyah*) composed of a mosque, a domed building (*kubbah*), in which are the tomb of some saint, schools for children and for the teaching of the Koran and the sciences, as well as living rooms for scholars and travelers. The tomb of the saint is sometimes itself called a Marabout, and is an object of pilgrimage for the pious Mohammedans. Consult Rinn, *Marabouts et Khouans* (Algiers, 1884).

MARACAIBO, mǎ'rā-ki'bō. The capital of the State of Zulia, Venezuela, situated on a sandy plain on the west shore of the strait which connects Lake Maracaibo with the Gulf of Venezuela (Map: Colombia, C 1). It is a handsome town, with a hot but healthful climate, and has several fine buildings, notably the government palace, the city hall, and the school of arts. It has also a nautical school, several libraries, and a hospital well located on an island opposite the city. Its streets are lighted by electricity and traversed by a tramway system. It has manufactures of candles, soap, hats, boots, and lumber. Its importance, however, is due to its harbor, which has the finest dockyards in the Republic and is deep enough to admit the largest vessels; the entrance is, however, made difficult by a shifting bar. It is the only port of entry for western Venezuela and a part of eastern Colombia, with which regions it carries on an active trade. In 1912 it held first rank among the ports of the Republic in exports and second rank in imports, the former amounting to \$2,293,802 and the latter \$1,217,822. The chief articles of export are coffee, cocoa, quinine, dyewoods, sugar, and hides. Steamship lines run to the United States, and a United States consulate is established here. Pop. (est.), 55,000. Maracaibo was founded in 1571 by Alonso Pacheco.

MARACAIBO, GULF OF. See VENEZUELA, GULF OF.

MARACAIBO, LAKE. A large sheet of water in the northwestern part of Venezuela, connected with the Gulf of Venezuela (or of Maracaibo) by a strait nearly 9 miles wide (Map: Colombia, C 2). It is of nearly rectangular shape, with a length from north to south of 100 miles and a width of 50 to 60 miles. Its extreme depth in the northern part is 500 feet, but it shoals rapidly towards the south, where the shores are low and marshy and the water

shallow. The entrance is obstructed by a bar with only 7 to 14 feet of water, so that large vessels cannot enter. Owing to the narrow entrance and to the great number of rivers which discharge into it, the water of the lake is fresh and the tides are scarcely felt, so that, though its form is that of a marine inlet, it is to be considered as an inland lake. It occupies part of a much larger lake basin surrounded by lofty mountains. This basin has been partly filled up by alluvium, leaving a number of smaller lakes connecting by creeks with the main lake.

MARAGHA, mǎ-rá-gǎ'. An old town in the west of Persia, in the Province of Azerbaijan, on the Safi River, 80 miles south of Tabriz (Map: Asia, Central, B 4). It consists mostly of mud houses inclosed by a high, dilapidated wall. The town is celebrated as the site of an observatory which Hulaku Khan built for the astronomer Nasir ed Din. It is surrounded by vineyards and orchards, the produce of which is exported to Russia. Famous marble pits produce a nearly transparent marble. Pop., about 16,000.

MARAIs, mǎ-rá', LE. 1. A name given during the French Revolution to the centre party of the Legislative Assembly and of the Convention, usually called the Plain. 2. A quarter of Paris, built on marshy ground, east of the Rue Saint-Denis and including the Place des Vosges, formerly, as the Place Royale, the centre of aristocratic Paris. It contains fine buildings from the time of Henry IV and Louis XIII. 3. Vast plains in the west of France, reclaimed from the sea, consisting of two distinct divisions, the Breton or western and the Poitevin or southern.

MARAJÓ, mǎ-rá-zhō', or JOANNES. A large island formed by the estuaries of the Amazon and the Pará and the network of river arms connecting them (Map: Brazil, H 4). It is 165 miles long from east to west and 120 miles wide. Its surface is very low and flat; the northern part consists of immense swamps, while the western part is covered with forests, consisting largely of rubber trees. There are several large lakes in the interior, and in the wet season the greater part of the island is flooded. In the dry season it affords excellent grazing. The population is scanty, consisting largely of hunters and rubber gatherers visiting the island during the dry season. The principal settlement is Sauré, on the east coast.

MARAL, mǎ-rǎl'. A large species of deer (*Cervus maral*) of the Caspian provinces of Persia, which is closely related to the European red deer in structure and habits, but is probably distinct from that species. Its antlers always terminate in more than two tines. Consult Lydeker, *Deer of All Lands* (London, 1898).

MÁRAMAROS-SZIGET. A town of Hungary. See MÁRAMAROS-SZIGET.

MAR'ANATH'A. An expression found in the New Testament near the close of Paul's First Epistle to the Corinthians (xvi. 22: "If any man love not the Lord Jesus Christ, let him be Anathema Maran-atha"; R. V., "anathema. Maran atha"). The term, not being Greek, but Aramaic, has occasioned much discussion. Interpreters ignorant of Aramaic, or in localities where there was no old tradition as to its meaning, considered it a threat of some sort. But ancient Eastern tradition and modern scholarship explain it as made up of

two Aramaic words, *māranā* (Our Lord) and *thā* (come). It is therefore to be understood as a fervent prayer or exclamation, "Our Lord, come!" A parallel is found in Rev. xxii. 20: "Even so, come, Lord Jesus." Maranatha is also found in the *Didache* (see TEACHING OF THE TWELVE APOSTLES) apparently with the same sense, at the end of a thanksgiving prayer in connection with the Eucharist. The expression doubtless came into vogue very early in Palestinian circles in connection with the expectation of the speedy return of Jesus, and probably as a part of the celebration of the agapē or love feasts. Consult: Schmidt, in the *Journal of Biblical Literature*, vol. xiii (Boston, 1894); Gustaf Dalman, *Grammatik des jüdisch-palästinischen Aramäisch*, p. 152 (Leipzig, 1894); James Hastings (ed.), *Dictionary of the Bible* (New York, 1909).

MARANHA, mǎ-rǎ-nyǎ, **MIRANHA**, or **MARIANA**. A fierce cannibal tribe of Arakan stock (q.v.), ranging from the Jutahy River on the south, across the Amazon and Putumayo, to the Yapurá on the north, in western Brazil and the adjacent parts of Colombia and Peru. They wear wooden labrets and ear pendants, with nose pendants of shell, but do not tattoo. The boring of a child's lips is celebrated by a feast. When a boy is 12 years old four gashes are cut near his mouth by his father, and he must then fast five days. At a later period the boys whip themselves as a test of manhood. In fighting expeditions each man carries a small bag of salt as an antidote against poisoned arrows. The Mirahan dialect is believed by Rivet to be a much modified and differentiated form of the Tupi-Guarani. Consult A. Mochi in *Archives pour l'anthropologie*, vols. xxxii, xxxiii (Paris, 1902-03), and *Journal de la Société des Américanistes de Paris*, vol. viii (N. S., ib., 1911).

MARANHÃO, mǎ-rǎ-nyoun', or **MARANHAM**. A northern state of Brazil, bounded by the Atlantic Ocean on the northeast, the State of Piahy on the southeast, Goyaz on the southwest, and Pará on the northwest (Map: Brazil, H 4). Its area is 150,795 square miles. The surface is only slightly elevated and traversed by a number of rivers. The coast land is generally low and subject to inundations. The climate is hot, the average for the year being 80° F., with very little variation. The boundaries with the states of Piahy and Pará and most of that of Goyaz are formed respectively by the Parnahyba, Gurupy, and Tocantins rivers. The important rivers of the interior are the Itapicurú, Mearim, Grajahú, and Pundaré. The soil is very fertile and the whole state is well wooded. The chief products are cotton, sugar, tobacco, corn, rice, and cacao. The conditions of the state make it adaptable for stock raising, which is carried on extensively. Agricultural development is greatly handicapped by the scarcity of population, and efforts are being made to establish agricultural colonies for the natives as well as to attract foreign settlers by liberal grants of land. The chief exports are sugar, cotton, rice, rubber, tobacco, cattle, hides, and skins. Pop., 1900, 459,508; 1912 (est.), 520,000. The inhabitants are chiefly whites of Portuguese descent, but there are also a considerable number of negroes and mulattoes and about 20,000 Indians. The capital is Maranhão (q.v.).

MARANHÃO, or SÃO LUIZ DE MARANHÃO.

The capital of the State of Maranhão, Brazil, situated on an island lying between the bays of São Marcos and São José, 280 miles southeast of Pará (Map: Brazil, J 4). The climate is very warm, but is not unhealthful. The town is well built and clean and has handsome public buildings, a theatre, a hospital, a cathedral, and a fine bishop's palace. It has training, music, and normal schools, the latter being considered the best in Brazil. The originally good harbor has suffered from silting, but extensive port works were begun in 1908 to improve this condition. The city carries on considerable commerce. In 1913 the imports amounted to \$258,677 and the exports \$305,189. It is the seat of a United States consular agent. Pop. (est.), 1912, 45,000. The town was founded by the French in 1612. The birthplace of many statesmen and writers, it is renowned for the cultivation of science and letters and is called the Brazilian Athens.

MARANO DI NAPOLI, mã-rä'nô dë nä'-pô-lë. A town in the Province of Naples, Italy, situated about 5 miles northwest of Naples. It lies in a fertile region and produces wine, grain, and fruit. Pop. (commune), 1901, 10,317; 1911, 11,934.

MARAÑON, mã'rä-nyôn'. A name sometimes applied to the upper course of the Amazon (q.v.).

MARASCHINO, mã'rä-skë'nô (It., from *marasca*, a sort of cherry, from Lat. *amarus*, bitter). A liqueur distilled from the fermented juice of the marasca cherry and flavored with its pits. The marasca cherry is a small black fruit, so named from its bitterness. Maraschino is chiefly made in Zara, Dalmatia. See LIQUEUR.

MARASH, mã-räsh'. The capital of the sanjak of the same name in the Vilayet of Aleppo, Asiatic Turkey, situated at the foot of Mount Taurus, about 90 miles north-northeast of its port, Alexandretta (Map: Turkey in Asia, C 3). It is a well-built city with fine bazars and a considerable trade in Kurd carpets and embroideries. Besides mosques and Mohammedan schools there are a number of Christian churches, a college and schools attached to the American mission, and a Jesuit establishment. In the vicinity of the town are found traces of Roman fortifications and tombs with Greek inscriptions. Many Hittite monuments have also been discovered near Marash. The population is estimated at from 40,000 to 52,000, including many Armenians.

MARAS'MUS (Neo-Lat., from Gk. *μαρασμός*, *marasmos*, decay, from *μαραινειν*, *marainein*, to weaken; ultimately connected with Skt. *mar*, to grind, *mlā*, weaken, OIr. *meirb*, AS. *mearu*, OHG. *muruci*, *murci*, Ger. *mürbe*, soft). A term somewhat vaguely used by the older medical writers to designate those cases of general emaciation or atrophy for which they did not see any special cause. The word still has a definite connotation as applied to infantile atrophy and is employed to describe a form of wasting due to nutritional disorder combined with bad hygienic surroundings and not dependent upon constitutional diseases such as tuberculosis and syphilis, although these may be an underlying factor in some cases. Marasmus occurs in bottle-fed babies, chiefly among the poor in large cities and in institutions. The symptoms are similar to those of slow starvation; the child, as a result of improper feeding, soon becomes unable to assimilate the food that is given it. The tempera-

ture is subnormal, the eyes large and sunken, the skin hangs in loose folds, the limbs are wasted, and the face has an indescribable look of age. The outlook for children under six months old is unfavorable, but timely and appropriate treatment restores some babies to health. This consists in careful feeding, by a wet nurse when practicable, bathing, massage, and fresh air. (See INFANTS, FEEDING OF.) The term is also used occasionally as a synonym for *tabes mesenterica*, or tubercular disease of the mesenteric glands. See TUBERCULOSIS.

MARAT, mã'rä', JEAN PAUL (1744-93). One of the radical leaders of the French Revolution, born May 24, 1744, at Boudry, near Neuchâtel, Switzerland. In youth he made himself master of several languages; subsequently he studied medicine at Bordeaux and at Paris, and, after traveling extensively in Europe, removed to London. There he practiced medicine and published *An Essay on Man* (1772) and *The Chains of Slavery* (1776). Returning to Paris, he wrote on optical subjects and electricity and entered the service of the Count of Artois as a veterinary surgeon in 1777. The fruits of his studies in physics appeared in a number of publications on electricity and optics. Upon the outbreak of the Revolution, Marat soon came to the front as one of its most extravagant, passionate leaders, and won a large following. After several abortive journalistic experiments he established, Sept. 12, 1789, a journal, *Le Publiciste Parisien*, which as *L'Ami du Peuple* and, after Sept. 21, 1792, as *Le Journal de la République* became one of the most famous papers of the revolutionary period. In it Marat attacked the moderates of the Constituent Assembly and later the Girondists with such violence that he was compelled on several occasions to take refuge in England. Danton, who had found Marat useful in the preparation of the events which led up to the storming of the Tuileries (Aug. 10, 1792), made him a member of the Commune of Paris. It was in a great measure the influence of Marat which led to the cruelties and massacres of September, 1792, in the midst of which he was elected a member of the Convention. His journal became more radical and vehement than ever. During the King's trial he was urgent for his immediate execution, and in his journal called upon the people to slay 200,000 of the adherents of the old régime. On April 14, 1793, he was brought before the Revolutionary Tribunal on the charge of fomenting sedition, but was acquitted (April 24) and returned to the Convention more powerful than ever. He played probably the leading part in the events of May 31 to June 2, which brought about the downfall of the Girondists, who had long regarded him as their inveterate enemy. On July 13, 1793, Marat was stabbed in his own house by Charlotte Corday (q.v.). His death aroused tremendous public feeling. His bust was placed in the Hall of the Convention; the scene of his murder was painted by David; fêtes in perpetuation of his memory were held all over France; mothers named their children after the "martyr of the people," and in November the Convention decreed to Marat's remains the honors of the Panthéon.

ments nouveaux et inédits (ib., 1891); E. B. Bax, *Jean Paul Marat, the People's Friend* (2d ed., Boston, 1901); *Polish Letters from the Original Unpublished Manuscripts*, issued by the Bibliophile Society (2 vols., ib., 1905); Charles Vellay, *Correspondance de Marat* (Paris, 1908).

MARATHI, mā-rā'tē. A language spoken in western India, belonging to the southern group of the Indo-Aryan family, and closely related to Hindi, Gujarati, and other modern vernaculars of Indo-Iranian origin. It is the tongue of between 15,000,000 and 20,000,000 people and is divided into several dialects, which are comprised under the two great groups Dakhani and Konkani. The former of these is found, as its name implies, in the Deccan and contains the standard dialect, called Deshi, spoken near Poona. The district of the Konkani is along the coast in the southwestern portion of the country of the Mahrattas. It contains a considerable mixture of Dravidian words from the neighboring Kanarese, and around Goa it has numerous Portuguese loan words. Marathi as a whole, despite its importations from Persian and Arabic, has departed less from the Sanskrit form than almost any other New Indian language. It is probably descended from the vernacular form of the Maharashtra Prakrit dialect of mediæval India.

Marathi literature is abundant. It begins in the thirteenth century with Namdev, a predecessor of the famous Tukaram (1609 A.D.), who wrote religious poems of a pronounced Vishnuistic trend. Another poet almost as highly esteemed as Tukaram was Mayur Pandit, 'or Moropant, in the eighteenth century. Prose works in Marathi are comparatively unimportant. Modern literature in this language, under English influence, is copious but rather mediocre. The alphabet employed by the Marathi is the Devanagari, in which Sanskrit is written.

For a brief account of its literature, see N. G. Ranade, *Rise of the Maratha Power* (Bombay, 1900).

MAR'ATHON (Lat., from Gk. Μαραθών). Anciently a small town on the coast of Attica, about 20 miles northeast of Athens (Map: Greece, Ancient, D 2). The modern village lies at the point where a valley opens into the plain of Marathon, which is surrounded by a semi-circular range of mountains on the north, west, and south, while on the east it is washed by the Bay of Marathon. South of the valley of Marathon is another valley, in which is the little village of Vrana, while from the southern extremity of the plain, between the sea and the mountains, a road leads by a circuitous route between

Mounts Pentelicus and Hymettus into the Attic plain. Along with three other towns, Probalinthos, Tricorythos, and Cœnoe, Marathon belonged to the Tetrapolis, which claimed a very early legendary origin and independent existence until the time of Theseus. It is clear that the league continued to exist for religious purposes until at least the fourth century B.C., and probably for a longer time. The plain of Marathon is especially famous as the scene of the decisive battle in which Miltiades (q.v.) led the Athenians and the Plateans to victory over the army of Darius under the command of Datis and Artaphernes in 490 B.C. (See GREECE, *Ancient History*.) The details of the battle are not easy to determine, as the ancient accounts are confused. It is probable that the Athenians occupied the valley of Vrana and attacked the Persians either when they were preparing to reëmbark or to execute a turning movement by the road to the south. The Greek force seems to have numbered about 10,000, of whom 192 fell. The numbers of the Persians are unknown, but the traditional 100,000 is certainly much exaggerated; their loss is said to have been 6400. Contrary to custom, the Athenian dead were buried on the field, and over their remains was raised the great mound (or *soros*) which is still conspicuous in the southern part of the plain. Its identity, at one time much disputed, was proved by the excavations of the Greek Archæological Society under Stais, in 1890 and 1891, which brought to light, in a space 85 feet by 20 feet, human bones, ashes, vases of the early fifth century B.C., and a sacrificial trench, where offerings had been made before the earth was heaped up. Some of the remains found in the *soros* are to be seen now in the National Museum at Athens. The literature on Marathon is very extensive. Besides the standard histories of Greece, consult: 'Αρχαιολογικὸν Δελτίον (Athens, 1891); Fraser, *Pausanias*, vol. ii (London, 1898), containing a large bibliography; Milchhöfer's text to Curtius and Kaupert, *Karten von Attika* (Berlin, 1881-95); Macan, *Herodotus*, books iv, v, vi, especially vol. ii, pp. 149-248 (London, 1895); *Journal of Hellenic Studies*, vol. xix (ib., 1899); G. B. Grundy, *The Great Persian War* (ib., 1901); Baedeker, *Greece* (with map: 4th Eng. ed., Leipzig, 1909).

MARATHONIANS. See MACEDONIANS.

MARATTA, mā-rāt'tā, or **MARATTI**, CARLO (1625-1713). An Italian painter of the Roman school, born at Camerano. He was a pupil of Andrea Sacchi and was influenced by the works of Raphael and the Carracci. Considered the most eminent painter in Rome, he long enjoyed the papal patronage. In 1702-03 Clement XI commissioned him to restore Raphael's frescoes in the Vatican, and Innocent XI appointed him superintendent of the paintings in the Vatican. He died at Rome as Prince of the Academy of St. Luke. Most of his pictures are small easel paintings in oil, the best being portraits. His design is academic, his color pleasing, his brushwork weak; his style resembles that of Guido Reni, but is even less original. He etched a number of important plates. Among his best paintings are the following: "Madonna," Palazzo Doria, Rome; "Annunciation," Turin Gallery; "Adoration of Shepherds," Basel Museum; "Holy Night," Dresden Museum; "St. John at Patmos," "Sleeping Child," "Portrait of a Cardinal," Old Pinakothek, Munich; "Presentation in the Temple," "Portrait of Clement IX,"

Hermitage, St. Petersburg; "Madonna in Glory," "Hagar and Ishmael," Madrid Museum; portrait of Cardinal Cerri, National Gallery, London.

MAR'AVE'DI, *Sp. pron. mā'rā-vā'dē* (Sp., from Ar. *Murābitin*, name of a Moorish dynasty, pl. of *murābit*, hermit). The name borne by certain Spanish coins. One of gold weighing about 60 grains was issued by the Moorish emirs in the eleventh and twelfth centuries; subsequently the maravedi constituted the lowest denomination in the Spanish coinage, varying in value from one-seventh to one-third of a cent.

MARBEAU, mār'bō', JEAN BAPTISTE (1798-1875). A French philanthropist, born at Brives. In 1841, while a city official at Paris, in making some investigations of the charitable institutions, he was struck with the lack of provision for the care of babies under two years of age whose mothers were compelled to go out to work. He wrote a book, *Des crèches*, advocating the establishment of day nurseries. The first was established at Chaillot, Nov. 11, 1844. An association of *crèches* was formed in 1846. Throughout the rest of his life, while specially interested in *crèches*, he took an active part in furthering various charities. Among his writings are: *Études sur l'économie sociale* (1844; 2d ed., 1875); *Des crèches, ou le moyen de diminuer la misère en augmentant la population* (1845; many later editions); *Du paupérisme en France et des moyens d'y remédier* (1847); *De l'indigence et des secours* (1850). He died at St. Cloud, Oct. 10, 1875.

MARBECK, mār'bek, or **MERBECK**, or **MERBECKE**, JOHN (?-c.1585). An English musician and theologian, organist of St. George's Chapel, Windsor, in the reign of Henry VIII and his successor. He early read Calvin's writings, adopted his views, and joined an association in support of the Reformed doctrines. Among the members were a priest, a chorister of St. George's Chapel, and a tradesman, and these men, together with Marbeck, were arrested on a charge of heresy. Their papers were seized, and in Marbeck's handwriting were found notes on the Bible, materials for a concordance in English, and a copy of an epistle of Calvin against the mass. They were all condemned to the stake, but Marbeck, on account of his musical talents and through the interposition of Gardiner, Bishop of Winchester, was pardoned and restored to his place as organist. His trial is related in Foxe, *Acts and Monuments*, book viii (London, ed. of 1857, vol. v). He lived to see the triumph of his principles and to publish his work, *The Boke of Common Praier Noted* (1550), an adaptation of the plain chant of the older rituals to the first liturgy of Edward VI; reprinted in facsimile (1844) and in Jebb's *Choral Responses and Litanies* (1857). He published also his *Concordance to the Bible* (1550), which was the first work of the kind in English on the entire Bible. A Te Deum of his and a mass of five voices are found in Smith's *Musica Antiqua*, now in the British Museum. In 1574 was published *The Lyres of Holy Sainctes, Prophetes, Patriarches, and Others* and subsequently *The Holie Historie of King David, drawn into English metre* (1579) and *A Ripping Up of the Pope's Fardel* (1581).

MARBELLA, mār-bā'lyā. A port of south Spain in the Province of Malaga (Map: Spain, C 4). It is situated amid picturesque surroundings on the shore of the Mediterranean, 35 miles northeast of Gibraltar. It is well built,

with a notable church of the Incarnation and the ruined castle of San Luis, its former defense, on the adjoining hill. In the neighborhood are granite quarries and mines of sulphur, lead, and iron; the town has iron foundries and sugar refineries. The harbor is used principally in local coasting trade; it is an ill-sheltered, open roadstead, but equipped with a large iron pier reaching into deep water and a lighthouse visible for 12 miles. The principal exports are iron, grain, sugar, cork, and fish. Pop., 1900, 9075; 1910, 10,286.

MAR'BLE (OF. *marble*, *marbre*, Fr. *marbre*, Prov. *marre*, *marbre*, from Lat. *marmor*, marble, from Gk. *μάρμαρος*, *marmaros*, bright stone, marble, from *μαρμαίρειν*, *marmairein*, to sparkle). In a strict sense a crystalline limestone having a granular structure. The term has, however, become broadened as a result of commercial use and now includes any limestone, either crystalline or noncrystalline, which will take a polish. Marbles vary considerably in their texture and color. Some are extremely fine-grained, like those of Vermont, while others are coarsely granular, as some Georgia ones. Those composed entirely of calcite or dolomite are pure white, but many are colored gray or blue by carbonaceous or graphitic matter, and sometimes grayish or greenish by fine scales of micaceous minerals. Others exhibit beautiful shades of pink, yellow, red, and brown, due to iron compounds. The mineral impurities which give the varied colors to the stone are often disposed in patches or wavy bands, and highly ornamental effects are sometimes obtained by properly matching these banded slabs. The presence of fossil remains may also add to their beauty. Marbles are usually found in regions of metamorphic rocks (see GEOLOGY), and hence the rock has been at times subjected to crushing forces. These have developed fissures in the rock, which subsequently became filled by foreign mineral matter, and it is to this that much of the beautiful marking or veining of many ornamental marbles is due.

Marble occurs in many geological formations, but in the United States it is obtained mostly from the Paleozoic rocks. The best-known deposits are found in the Eastern States. In western Vermont, at West Rutland, Proctor, Brandon, and other localities, some of the quarries have reached a depth of 400 feet and contain many grades, varying from the purest white statuary marble to the gray, or "true blue" variety, as it is called. In recent years gray and green banded marbles have been quarried to an increasing extent for decorative work. A fine-grained, white, dolomitic marble is quarried at Lee in western Massachusetts, and a medium-grained gray marble for structural work is obtained from St. Lawrence Co., N. Y. Cockeysville, Md., furnishes white marble, but is the most important Southern producer of gray and white stone for structural and decorative purposes. Near Swanton, Vt., there occurs a deposit of variegated marble much used for wainscoting and floors. Some of the varieties found here resemble imported marbles. The pink and brown marbles are widely used for wainscoting and flooring. Aside from the above areas, marble of white and gray striping is quarried in Inyo Co., Cal., and a white marble is now being quarried in Colorado. Two types which have attracted some attention are the serpentine, or verde antiques, found in eastern

MARBLE

SUTHERLAND FALLS QUARRY OF THE VERMONT MARBLE CO., AT PROCTOR, VT.

Pennsylvania, and the onyx marbles from Arizona, Colorado, and California. These latter are not true onyx, but a travertine, composed of carbonate of lime, and formed in caves or around calcareous springs. Serpentine marble, although of high ornamental value, should not be used exteriorly in severe climates.

Many ornamental marbles are imported into the United States from various European countries. Among the more important types are: *Skyros* from Greece, the brecciated variety being much employed; *Black and Gold*, a black Italian limestone veined with yellow; *Brocatelle*, a light-yellow marble with red cloudings, obtained from the Pyrenees; *Carrara*, the white marbles quarried at Carrara, Italy; *Giallo antico*, a yellow marble much sought after by the ancient Greeks and Romans; and *Griotte*, a bright-red variety, obtained in the Pyrenees. The last named is also found at Swanton, Vt. *Landscape* marble is a variety containing coloring matter dispersed through it in such a manner as to resemble a landscape. *Nero antico* is a greenish-black serpentine marble; *Numidian* marble is an African variety, often of yellow color; *Parian*, a white marble much used by the ancient Greeks and obtained from the island of Paros; *Pentelico* is another white marble used by the ancient Greeks, occurring near Athens; *Rosso antico*, a red marble; *Siena*, a yellowish marble, often with veins or patches of gray or purple.

The most famous marble known to the ancients was the Parian marble, which was a finely granular and very durable stone, of waxy appearance when polished. Some of the finest Grecian sculptures were formed of this marble, among them being the Venus de' Medici. The Pentelico marble was at one time preferred by the Greeks to Parian, because it was whiter and finer grained. The Parthenon was entirely built of it. It does not resist the weather well. The quarries at Carrara were known to the ancients, but their chief importance has been in modern times. The temple of Jupiter Serapis near Naples was constructed of a gray-streaked micaceous marble, much used by the ancients and known as *cipolino*.

Marble suitable for structural work sells for about \$1.30 to \$1.50 rough per cubic foot, while monumental stone brings a little more, but good statuary marble may bring as much as \$10 per cubic foot. Marble must commonly meet certain requirements as to strength, color, texture, freedom from flaws, and durability in the open air. Its crushing strength is commonly from 10,000 to 12,000 pounds per square inch.

The opening of a marble quarry is usually expensive and attended with financial risks, as a thickness of from 10 to 30 feet of rock usually has to be taken off before sound marble is reached. After a sufficient area of surface has been prepared by the removal of the imperfect stone, channeling machines, which may be either percussion or diamond drills, are set to work and rectangularly crossed channels are cut to a desired depth, say from 5 to 7 feet. One of the blocks, called the key block, is then broken off at the base by wedging and lifted out with a crane. This gives ready access to the others, which are then drilled as circumstances may require, the quarry being worked out in floors. The blocks removed commonly run 4 feet, 6 inches by 6 feet, 6 inches, but much larger ones are sometimes extracted on special demand. The marble after quarrying is taken to the mill and

sawed into blocks or slabs or chiseled into monumental pieces. The first smoothing is done with sand and water, but the final polishing with a mixture of putty powder and weak acid rubbed on with a flannel-covered revolving buffer. The value of marble produce in the United States in 1913 was as follows:

Sold by producers in rough state.....	\$3,645,863
Dressed for:	
Building (exterior).....	829,244
Ornamental purposes.....	34,850
Monumental work.....	1,135,658
Interior decoration.....	1,869,262
Other uses.....	356,013
Total, United States.....	\$7,870,890
Imports, 1913.....	1,367,607
Total consumption.....	\$9,238,497

Of the total United States value, Vermont produced 44.64 per cent, Tennessee 18, and Georgia 14. See BUILDING STONE.

MARBLE, MANTON (1834-1917). An American journalist. He was born at Worcester, Mass.; graduated at the University of Rochester in 1855; and became a journalist in Boston, where he was assistant editor for a year of the *Journal* and editor for another year of the *Traveler*. He removed to New York in 1858 and was employed during the next two years on the editorial staff of the *Evening Post*. In 1860 he united with others in founding the *World*, of which he was proprietor and editor from 1862 to 1876. The publication of the *World* was temporarily suspended by President Lincoln for the printing of false dispatches in 1864. Marble wrote the Democratic State platform of 1874, the Democratic national platform of 1876, and most of the national platform of 1884. In 1878 he published *A Secret Chapter of Political History*, in which he upheld Tilden's claim to the presidency. In 1885 he was appointed a special envoy to Great Britain, France, and Germany on bimetallic questions.

MARBLED GODWIT. See GODWIT.

MARBLED TIGER CAT. A very distinct and beautiful wild cat of the eastern Himalayas and Malayan region (*Felis marmorata*), which in appearance is a miniature of the clouded leopard. It is about the size of the domestic cat and has unusually soft and warm fur and a long tail, not ringed, but spotted. The ground color is dull reddish yellow, marked with numerous elongate, wavy black spots, somewhat clouded or marbled. There are dark lines on the head, and the flanks and legs are thickly spotted with black, while the belly is yellowish white. It has a Tibetan variety. Its habits are little known, but are supposed to be mainly arboreal.

MARBLE FAUN, THE. A romance by Haw-

thorne (1860). The title originally proposed was *The Transformation of the Faun*, changed in the English edition to *Transformation*, and in the American to *The Marble Faun*.

MARBLEHEAD'. A town, including the villages of Clifton, Devereux, and Marblehead Neck, in Essex Co., Mass., 18 miles northeast of Boston, situated on a rocky peninsula in Massachusetts Bay and on the Boston and Maine Railroad (Map: Massachusetts, F 2). It is a port of entry and has a deep and safe harbor, is a popular yachting and summer resort, and possesses many pre-Revolutionary buildings and other features of historic interest. In Abbot Hall are the town offices, the public library, and an art gallery. There are Crocker, Fort Sewall, and Fountain parks. The principal industries include boat building and the manufacture of shoes and aeroplanes, though fishing and seed growing are of some importance. The government is administered by town meetings. There are municipal water works and electric-light plant. Pop., 1900, 7582; 1910, 7338. Settled in 1629 by emigrants from the east and south of England, and later by people from the islands of Jersey and Guernsey, Marblehead was under the jurisdiction of Salem until 1649, when it was incorporated as a separate town. It ranked for a time next to Boston in its maritime and fishing trade. Marblehead was the birthplace, and for many years the home, of Elbridge Gerry and Judge Story. Consult Roads, *The History and Traditions of Marblehead* (Marblehead, 1897).

MARBLEHEAD. A sailors' name for the North Atlantic fulmar (q.v.).

MARBLE PLAN. See FORMA URBIS ROMÆ.

MARBLES AND MARBLE PLAYING. Marbles are little balls of marble or some other hard substance and are used as playthings by children. They have been in use from the earliest times and are to be found among all the peoples of the world. They are manufactured in large quantities in Saxony and are exported to India, China, Africa, and practically every nation of Europe and America. There is an endless variety of games of marbles.

MAR'BO, or MAROBO'DUUS (c.11 B.C. -41 A.D.). A Germanic chief, King of the Marcomanni. See MARCOMANNI.

MARBOD, mār'bō', or MARBODIUS (c.1035-1123). A French bishop and author. He was born at Angers, the son of a merchant, and taught with great success, becoming in 1067 head of the diocesan school, in which he trained many prominent scholars and statesmen. Marbod was made Archdeacon in 1081 and Bishop of Rennes in 1096. In 1104 he took part in the Council of Tours, and in 1109 he was administrator of the diocese of Angers during the absence of the Bishop. His works include biographies, hymns, the *Versus Canonicales*, valuable as giving a picture of the monkish life of the period, and *De Lapidibus Pretiosis*, which, following a Greek original, treats of the mysterious properties of gems. Marbod's works are contained in Migne, *Patrologia Latina*, vol. clxxi (1854). His hymns are to be found in Blume and Dreves, *Analecta Hymnica* (Leipzig, 1907).

MARBOIS, mār'bwā', FRANÇOIS, MARQUIS DE BARBÉ. A French statesman. See BARBÉ-MARBOIS.

MARBURG, mār'burk. A town in the Crownland of Styria, Austria, 37 miles southeast of Gratz, in the wooded plain on the

left bank of the navigable Drave (Map: Austria, D 3). The town has a sixteenth-century cathedral, a mediæval castle, an episcopal palace, and a casino. It is the seat of the Prince-Bishop of Lavant. Its educational institutions include schools of theology and pedagogy, a pomological school, and a school for vintners. The chief industries are the manufacture of leather, footwear, iron, cement, cutlery, flour, and spirits. The extensive workshops of the Southern Railway are situated in the suburb of Sankt Magdalena. Marburg carries on an extensive trade in wine, grain, poultry, and lumber, the chief products of the surrounding country. Pop., 1900, 24,501; 1910, 22,994, mostly Germans. Consult Bücking, *Geschichtliche Bilder aus Marburgs Vergangenheit* (Marburg, 1901).

MARBURG. A town in the Province of Hesse-Nassau, Prussia, on the Lahn, 60 miles north of Frankfort (Map: Germany, C 3). The town is built on terraces from the river up to a thirteenth-century castle on the summit. The castle was originally the residence of the landgraves of Hesse, later a state prison, and is now a repository for the Hessian state archives. In its Rittersaal the disputation concerning transubstantiation between Luther and Zwingli took place in 1529. Its thirteenth-century church of St. Elizabeth, a perfect specimen of early Gothic architecture, was erected by the Teutonic Knights and contains the fine tomb of the saint, as well as numerous monuments to the Hessian rulers and Teutonic Knights. Noteworthy are also the Rathaus (1512), the fourteenth-century Lutheran church, and the government buildings. The educational institutions of Marburg include the university with a library of 260,000 volumes (see MARBURG, UNIVERSITY OF), a Gymnasium, a Realschule, a nurses' school, and an agricultural school. The chief manufactures are leather, pottery, machinery, surgical instruments, pewter ware, toys, corsets, carpets, and tobacco. The environs are of great natural beauty. Pop., 1900, 17,527; 1910, 21,860, chiefly Protestants.

First mentioned in 1140, Marburg was endowed with municipal rights by the Landgrave Louis of Thuringia in 1227, and after his death became the residence of his widow, Elizabeth of Hungary. During the fifteenth and sixteenth centuries Marburg was one of the residences of the landgraves of Hesse. It passed with Hesse-Cassel to Prussia in 1866. The fortifications were demolished by the French in 1810-11.

MARBURG, KONRAD VON. See KONRAD VON MARBURG.

MARBURG, THEODORE (1862-). An American publicist, born at Baltimore, Md. He studied at Johns Hopkins (1880-81), at Oxford, England (1892-93), at the Ecole Libre de la Science Politique, Paris (1893-95), and at the University of Heidelberg (1901 and 1903). He became active in various economic, political, law, art, and peace societies; became trustee of Johns Hopkins; and was United States Minister to Belgium in 1912-13. He translated Emile Levasseur's *Elements of Political Economy* and published: *In the Hills* (1895), a poem; *The World's Money Problem* (1896); *The War with Spain* (1898); *Expansion* (1900); *The Peace Movement Practical* (1910); *Salient Thoughts—Judicial Settlement Conference* (1911); *Philosophy of the Third American Peace Congress* (1912).

MARBURG, UNIVERSITY OF. The first Protestant university of Germany, founded by Philip,

Landgrave of Hesse, in 1527, and endowed with the income of 13 suppressed monasteries. The Imperial assent was given in 1541. The new foundation drew largely from Wittenberg for its early teaching staff, became a stronghold of Lutheran doctrine, and flourished accordingly. In 1607 Landgrave Moritz converted it into a Calvinistic school, which conversion resulted in the departure of many professors and students and the foundation of the University of Giessen. The Thirty Years' War nearly ruined the university, which was reconstituted in 1653. Since the incorporation of Hesse-Cassel with Prussia it has flourished greatly. The university developed especially the provision of facilities for the study of modern languages and philology and maintained a strong summer school in these subjects. In 1913 it had a budget of nearly 1,500,000 marks, and 2406 students, including 163 women, in theology, medicine, law, and philosophy, the majority being in the two latter faculties. Its library contains about 260,000 volumes and 200,000 dissertations.

MARBURY vs. MADISON. The title of a famous decision rendered by the Supreme Court of the United States in 1803 and reported in the first volume of *Cranch's Reports*. Its importance in the constitutional development of the United States lies in the fact that this was the first instance in which the Supreme Court assumed the right to declare a statute of Congress null and void on account of its repugnance to the Constitution. It is popularly regarded as the chief basis for the American doctrine of the right of the courts to disregard unconstitutional statutes, although the right had been asserted by State courts in some half a dozen instances before the adoption of the Federal Constitution. The case of *Marbury v. Madison* arose out of an attempt of the plaintiff to secure a writ of mandamus from the Supreme Court to compel James Madison, then Secretary of State, to deliver to him a commission as justice of the peace of the District of Columbia. Marbury had been appointed to this office by President Adams, the Senate had confirmed the nomination, and his commission had been made out, signed and sealed, but had not been delivered. When Madison entered upon his duties as Secretary of State he found the commission and refused to deliver it. Marbury, in bringing his suit, relied upon an act of Congress which empowered the Supreme Court to issue the writ of mandamus to executive officers to compel them to perform their duties in certain cases. But as the Constitution expressly enumerates the cases in which the Supreme Court shall have original jurisdiction and nowhere mentions the right of issuing the writ of mandamus, the congressional act in question was clearly without constitutional warrant. This evident repugnance of the statute to the Constitution was the first question decided by the court. The second point in the decision related to the power of the court to declare the act null and void and to refuse to be bound thereby when its repugnance to the Constitution was once established. Chief Justice Marshall, who delivered the opinion of the court, declared that if two laws conflict with each other, the courts must decide on the operation of each, and if a law be in opposition to the Constitution so that the court would have to decide the case conformably to the law disregarding the Constitution or conformably to the Constitution disregarding the law, the court

must decide which of these conflicting rules governs the case. If then, he said, the courts are to regard the Constitution, and if the Constitution is supreme over any ordinary statute, the Constitution and not the statute must govern the case to which they both apply. Marshall's argument was readily accepted as the only correct and just rule, and thus was laid the foundation of a judicial prerogative which has immensely influenced the legal and constitutional development of the United States. Consult: T. M. Cooley, *Constitutional History of the United States* (New York, 1889); J. B. Thayer, *John Marshall* (Cambridge, 1904); id., *Legal Essays* (Boston, 1908). See CONSTITUTIONAL LAW.

MARCA, mār'kă', PIERRE DE (1594-1662). A French historian and ecclesiastic, born at Gan, near Pau. He studied law at the University of Toulouse, and for his zealously in reestablishing the Catholic faith in Béarn he was appointed president of Pau in 1621 by Louis XIII. After the death of his wife in 1631 he studied theology, in 1639 he became a member of the Council of State, and in 1641 the King made him Bishop of Couserans. From 1644 to 1651 he was Intendant or Governor of Catalonia, then held by the French, and in 1652 he became Archbishop of Toulouse. During the uprising of the Fronde Marca supported Louis XIV in opposition to the Pope, and he succeeded Retz, who resigned, as Archbishop of Paris in 1662. His historical writings include: *Histoire de Béarn* (1640); *De Concordia Sacerdotii et Imperii seu de Libertatibus Ecclesiae Gallicanae* (1641); *Marca Hispanica seu Limes Hispanicus* (1688).

MAR/CASITE (Fr. *marcassite*, Sp. *marquesita*, from Ar. *marqashitha*, from *raqasha*, to speckle, to embellish). An iron disulphide that crystallizes in the orthorhombic system, has a metallic lustre, is of a pale bronze-yellow color, and resembles pyrite, from which it differs only in crystalline form. It is found in Bohemia, Saxony, Hungary, and in the United States at various localities in New York, Massachusetts, Connecticut, and New Hampshire. The mineral is mined in some parts of Europe for its sulphur and for the ferrous sulphate that may be made from it. The word was applied indifferently to crystallized varieties of iron sulphide until 1845, when it was retained exclusively for the orthorhombic variety.

MARCATO, mār-kă'tō (It., marked). In music, a term signifying in a strongly accentuated manner.

MARCEAU, mār'sō', FRANÇOIS SÉVERIN, called MARCEAU-DESGRAVIERS (1769-96). A soldier of the French Revolution, born at Chartres. He joined the army as a private at the age of 16, participated actively in the capture of the Bastille, and in 1792 was in the Army of the Ardennes commanded by Lafayette. His services under Westermann in La Vendée made him general of division in 1793. With Kléber he crushed the rebellion at Cholet, then fought under Jourdan in 1793-94. A Prussian sharpshooter mortally wounded him at Altenkirchen. In 1889 his remains were placed in the Panthéon at Paris.

MARCEL, mār'sél', ETIENNE (?-1358). Provost of the merchants of Paris. After the battle of Poitiers (q.v.), in 1356, Marcel took the government of Paris into his own hands. To check the abuses to which the citizens were subjected he had two of the most prominent officials

of the King put to death. In order not to be obliged to obey the commands of King John, who was a prisoner in the hands of the English, Marcel induced the Dauphin to take the regency. Finding the Regent opposed to him, he sought aid from Charles the Bad, King of Navarre, and from the Jacquerie (q.v.). This made him unpopular and he was slain by a rising on July 31, 1358. For a few months he had been the most powerful man in France. It is impossible now to judge his conduct or his aims with certainty. Consult Ernest Lavisse, *Histoire de France depuis les origines jusqu'à la révolution*, vol. iv, part i (Paris, 1902), and the works cited there.

MARCELINE, mār'sé-lén'. A city in Linn Co., Mo., 106 miles northeast of Kansas City, on the Atchison, Topeka, and Santa Fe Railroad (Map: Missouri, C 2). It is in a rich coal and oil region, having three mines and an oil and gas pumping station. There are railroad shops and roundhouse of the Santa Fe System, and a concrete-block factory. Marceline contains a sanitarium and municipal water works and electric-light plant. Pop., 1900, 2638; 1910, 3920.

MAR'CELLINUS, SAINT. Bishop of Rome, or Pope, 296-304. He was born in Rome, but little is known of his life or administration. There is an account of a synod held at Sinuessa in 303 or 304, at which Marcellinus is said to have confessed that, at the instance of Diocletian, he had offered incense to Vesta and Isis. The synod is said to have deposed Marcellinus, who, with many members of the synod, was put to death by Diocletian. The story is denied by Augustine and Theodoret and is not credited by either the Roman Catholics or the Protestant controversialists. The Roman church commemorates Marcellinus on April 24. Consult J. J. I. von Döllinger, *Fables Respecting the Popes of the Middle Ages* (New York, 1871).

MARCELLO, mār-chél'lō, BENEDETTO (1686-1739). An Italian composer. He studied music under Gasparini and Lotti and is chiefly known for the music to Giustiniani's paraphrase of 50 Psalms. He also wrote an opera *Le Fede riconosciuta*, an oratorio *Giuditta*, five *concerti*, and a number of sonatas. The characteristics of his musical style are melody, simplicity, and a sound good taste. He was also an instructor of wide reputation, and a conservatory at Venice is named after him. He wrote the satire *Il teatro alla moda* (1720). Consult Enrico Fondi, *Benedetto Marcello* (Rome, 1909).

MARCEL'US. The name of two popes. —**MARCELLUS I**, SAINT, POPE, 308-309, a Roman by birth, elected after an interregnum of four years due to the persecution of Diocletian. A new outbreak under Maxentius drove him from Rome, the attention of the heathen authorities being directed to him by his severity against the lapsed. He died in exile, but his body was brought back to Rome and buried in the cemetery of Priscilla with that of his predecessor, Marcellinus. His feast day is January 16. —**MARCELLUS II**, POPE, 1555, Marcello Cervini degli Spannocchi. He was born in 1501 at Montepulciano and made Bishop of Nicastra and Cardinal in 1539. He was one of the legates appointed to preside over the Council of Trent, and was elected Pope in spite of the opposition of the Imperial party. His reign, however, for which his character and learning had given great hopes, lasted only 22 days. Palestrina's famous "Missa Pope Marcelli," written in 1562, was named in his honor, and the name gave rise to

the story that it was sung in his presence and won the Pope's regard for polyphonic music.

MARCELLUS, MARCUS CLAUDIUS (c.268-208 B.C.). 1. A famous Roman general. He belonged to a distinguished plebeian family. He was consul for the first time in 222 B.C., and obtained a decisive victory over the Insubrians in Cisalpine Gaul, slaying with his own hand their King, Britomartus or Viridomarus, whose spoils he dedicated to Jupiter; for this he was honored with a triumph. This was the third and last occasion in Roman history on which *spolia opima* were offered to Jupiter Feretrius. In the Second Punic War, after the defeat of the Romans at Cannæ, Marcellus fought as prætor, in 216 B.C., against Hannibal at Nola in Campania; and the victory which he gained there was the more important as it showed that Hannibal was not invincible, and that the Romans had not been irreparably overthrown at Cannæ. In the course of two years he thrice repulsed the Carthaginian general at this place. Being consul again in 214 B.C., he was intrusted with the command of the war in Sicily. He took Leontini, massacring in cold blood 2000 Roman deserters whom he found there, and then advanced against Syracuse, which he tried to storm. All his efforts were rendered unavailing by the skill of Archimedes, and he was compelled to blockade the city. Famine, pestilence, and ultimately treachery on the part of the Spanish auxiliaries of the Syracusans enabled Marcellus to make himself master of the place (212 B.C.), after which the remainder of Sicily was soon brought under the dominion of the Romans. In 210 B.C. he was again consul and was again opposed to Hannibal, with whom he fought an indecisive battle at Numistro in Lucania, and by whom he was defeated at Canusium in Apulia in 209 B.C. On the following day, however, he retrieved the defeat. In 208 B.C. he was for the fifth time elected to the consulate, and assumed once more the command of the Roman army against Hannibal. When out reconnoitring one day he fell into an ambushade near Venusia and was slain. Consult Livy, books xxiii-xxvii, passim, and the article "Claudius 45," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914). 2. A distinguished Roman orator, a vigorous opponent of Julius Cæsar, who, when consul in 51 B.C., proposed that Cæsar's command in Gaul should end in March, 49. In January, 49, when Pompey's supporters were keen for war with Cæsar, he urged delay till a suitable army could be prepared, but unsuccessfully. He went to Greece with Pompey, but after the battle of Pharsalus he retired to Mytilene, to study rhetoric and philosophy. In 46 the Senate appealed to Cæsar to pardon him; in support of this appeal Cicero delivered his speech *Pro Marcello*. When the pardon was granted Marcellus started for Rome, but was murdered at Athens by one of his retainers. 3. The son of Augustus' sister Octavia, and C. Marcellus; he was born in 43 B.C. In 25 B.C. the Emperor adopted him as his son and successor and married his daughter Julia to him, but two years later the young man died, at Baïæ. In certain famous lines (*Æneid*, vi, 860-886) Vergil refers to his death. Augustus named a theatre in Rome in his honor.

MARCELLUS, NONIUS. See NONIUS MARCELLUS.

MARCELLUS, THEATRE OF. A theatre in Rome, begun by Julius Cæsar, completed by

Augustus in 13 B.C., and named for his nephew and son-in-law Marcellus. (See MARCELLUS, 3.) The stage lay towards the river. Of the semi-circular structures which carried rows of seats a large portion, comprising 12 arches in two tiers, is still standing. This portion is similar in general external appearance to the Coliseum, and is built of travertine with Doric arcades in the lower tier and Ionic in the upper. The arrangements of the cross walls and seats within the theatre were also duplicated in the Coliseum. The pilasters of the third story were Corinthian and the windows were rectangular. The theatre, according to ancient authorities, could seat about 13,500 spectators; Ch. Huelsen, in *Bullettino della commissione archeologica comunale di Roma* (1894, p. 312), gives the seating capacity as 9000 to 10,000. In the fourth century some of the travertine blocks were used in restoring the Cestian bridge. In the eleventh century the building was turned into a stronghold of the Pierleoni, and in the fourteenth century it was purchased by the Savelli, upon whose extinction it passed to the Orsini in 1712. The palace of the latter family stands upon the stage and the seats, which are buried under 15 feet of modern soil. Many corridors and chambers of the original building are preserved and are used as offices of the palace. The remains of the Doric arcades are used as low shops. Consult: R. A. Lanciani, *The Ruins and Excavations of Ancient Rome* (Boston, 1897); S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., ib., 1911); Charles Knapp, "The Roman Theater," in *Art and Archaeology*, vol. i (New York, 1915).

MARCH. See MARCHING.

MARCH. See MONTH.

MARCH (OF., Fr. *marche*, from Goth., OHG. *marka*, Ger. *Mark*, AS. *mearc*, border; connected with Lat. *margo*, OIr. *brú*, Welsh, Corn. *bro*, Av. *marəzu*, boundary). A term applied in England during the early Middle Ages and later to the frontier or border line between England and Wales and between England and Scotland. In Anglo-Saxon times the word appears under the form *Mercia* as the name of the most western of the English kingdoms. See MARK.

In Scotland the word came into common use to designate the boundaries of real property, corresponding to the English term "boundary" (q.v.).

MARCH, mǎrk (Lat. *Marus*, Slav. *Morava*). A tributary of the Danube and the principal river of Moravia (Map: Austria, E 2). It rises in the Sudetic Mountains on the boundary of Silesia, and runs southward, forming in its lower course the boundary between Austria and Hungary, and entering the Danube 26 miles east of Vienna, after a course of about 217 miles, for the last 80 of which it is navigable. Its headwaters lead to the Moravian Gap or Gate. See MARCHFELD.

MARCH (Fr. *marche*, from *marcher*, to walk, march, probably from OF., Fr. *marche*, boundary; or possibly from Lat. *marcus*, hammer; connected with Skt. *mar*, to grind, on account of the beat of the feet). A musical composition having primarily as its object the regulation of the steps of a large number of persons in motion. Even in remote antiquity solemn processions were always accompanied by music. In the Greek tragedy the entrance as well as the exit of the chorus was so accompanied. The military march undoubtedly was developed from soldiers'

songs. The ordinary march used for parades, drills, etc., has about 75 steps to the minute, the quickstep about 100, and the double quick or charge about 120. The march as an art form was developed from the dance forms during the seventeenth century. Lully in his operas and F. Couperin in his piano works established the march form as consisting of two reprises of eight or 16 measures. To this was added, somewhat later, a portion distinguished by repose and broad melodic outline, generally in a closely related key. This was called the trio, because at first it was in three-part writing as against the two-part writing of the first section. After the trio the first section is repeated. To-day the art form of the march is highly developed and employed on various occasions. A special kind of march is the funeral march. It is written in very slow time (grave, lento, adagio) and always in the minor mode. The trio is in the relative or corresponding major. Beethoven's great funeral march in the *Eroica Symphony* is in C minor with trio in C major; Chopin's funeral march in the Sonata op. 35 is in B flat minor with trio in D flat major.

MARCH, ALDEN (1795-1869). An American surgeon, born at Sutton, Mass. He attended medical lectures in Boston and at Brown (M.D., 1820). Subsequently he served as professor in the Vermont Academy of Medicine (1825-31), in Albany Medical Seminary (1827-33), and in Albany Medical School (1833-34). In 1834 he established a school of practical anatomy and in 1839 he founded the Albany Medical College, which absorbed the other medical schools of that city. In this new institution March held the chair of surgery from 1839 until his death. The growth and development of the college are largely to be attributed to his work. He was also the founder of the Albany City Hospital. March was president of the New York State Medical Society (1857) and a founder of the American Medical Association, of which he was president in 1864. He was a successful operator and originated several well-known surgical appliances, such as an improved splint for use in hip disease (1853), an improved harelip forceps (1855), instruments for the removal of dead bone (1860), and a new instrument for the removal of urinary stones. He contributed largely to medical journals and is the author of *Wounds of the Abdomen and Larynx* (1854).

MARCH, AUSIAS (?1397-1459). A Catalan poet, born in Valencia, probably before the end of the fourteenth century. He was admired and praised not only by his fellow citizens in Cataluña, but also by noted Spanish authors. In March's chief works, the *Cants d'amor* and the *Cants de mort*, he is visibly under the influence of Petrarch, as are so many of his contemporaries. He avoided all close imitation, however, and may safely stand on his own merits. Liveliness of fancy and genuineness of sentiment are among his best traits; his chief defect is a certain obscurity of expression. Consult the edition of his poems by Pelayo y Britz (Barcelona, 1864) and that of Barcelona, 1888, neither of them a good reproduction of the sixteenth-century editions; J. Rubió y Ors, *Ausias March y su época* (ib., 1862); A. Pagès, "Documents inédits relatifs à la vie d'Ausias March," in the *Romania*, vol. xvii (Paris, 1888). The best edition of his works is that by Amadeu Pagès, *Les obres d'Ausias March* (3 vols., Barcelona, 1912 et seq.).

MARCH, EARL OF. See WEMYSS.

MARCH, EARL OF. See MORTIMER, ROGER DE.

MARCH, FIELD OF. See CHAMP DE MARS.

MARCH, FRANCIS ANDREW (1825-1911). An American philologist and author, born at Millbury, Mass. He graduated in 1845 at Amherst, where he was tutor in 1847-49, and, after studying law in New York, was in 1850 admitted to the bar. He taught at Fredericksburg, Va., from 1852 to 1855 and from 1856 to 1906 was professor of English language and comparative philology in Lafayette College. He became honorary emeritus professor under the Carnegie endowment in 1907. In 1873-74 and 1895-96 he served as president of the American Philological Association, from 1876 to 1905 as president of the Spelling Reform Association, and in 1891-93 as president of the Modern Language Association of America. He received honorary degrees from Princeton, Amherst, Columbia, Oxford, and Cambridge. In 1879 he was chosen to be the head of the American staff of *A New English Dictionary on Historical Principles*, prepared under the direction of the Philological Society of London. March's article "On Recent Discussions of Grimm's Law," which was published in the *Transactions* of the American Philological Association of 1873, anticipated to a great extent the law of vocalic accent discovered by Verner in 1877. His publications include: *A Method of Philological Study of the English Language* (1865); *Anglo-Saxon Reader* (1870); *Comparative Grammar of the Anglo-Saxon Language* (1870); and a *Thesaurus Dictionary of the English Language* (1903). He also edited a series of textbooks of Greek and Latin authors, and was consulting editor of the *Standard Dictionary* (1890-94). Consult *Addresses in Honor of Prof. F. A. March*, delivered at Easton, Pa., on Oct. 24, 1895, and J. W. Bright, "Address in Commemoration of Francis Andrew March," in *Modern Language Association of America, Publications*, vol. xxix (Cambridge, 1914).

MARCHAND, mār'shān', FÉLIX GABRIEL (1832-1900). A Canadian statesman, born at St. John's, Quebec. He studied at St. Hyacinthe College and was admitted a notary in 1855. In 1867 he was elected a Liberal member of the Legislative Assembly of the Province of Quebec, from 1878 to 1879 was Provincial Secretary, and in the latter year was also Commissioner of Crownlands. From 1887 to 1892 he was Speaker of the Assembly, in 1892 succeeded Honoré Mercier (q.v.) in the leadership of the Liberal party in the Legislature, and in 1897 was appointed Premier and Treasurer. In 1860 he established *Le Franco-Canadien*, which he edited for many years. He wrote: *Fatenville* (1869); *Erreur n'est pas compte* (1872); *Un bonheur en attire un autre* (1884); *Les faux brillants* (1885).

MARCHAND, JEAN BAPTISTE (1863-). A French officer and explorer, born at Thoissey, Ain. He entered the army in 1883, received a commission in 1886, and from 1888 to 1899 he explored parts of Africa. His explorations in search of an improved route to the Gulf of Guinea from the valley of the Niger resulted in a scheme for the Transnigerian Railway between the Bandama and Niger rivers. In 1898 he established on the White Nile the post of Fashoda, which resisted attacks from the dervishes, but found a more formidable foe in General Kitchener, who, with British forces fresh from their victory over the Mahdi, was determined to take possession of the country. Major Marchand

refused to withdraw, and international complications ensued; but the affair was settled when the French government retired from the position while Marchand was on his way home to report. He took part in the expedition for the relief of Peking in 1902 and was promoted to the office of colonel, but resigned in 1904, not being permitted by his government to enter the Russian army during the Russo-Japanese War. He was made a Commander of the Legion of Honor. Consult Murphy, *Le commandant Marchand et ses compagnons d'armes à travers l'Afrique* (Paris, 1900). See KODOK.

MARCHANT, mār'chant, JAMES (1867-). An English reformer. From 1889 to 1894 he was evidential lecturer to the Bishop of St. Albans and then preached in Trinity Presbyterian Church, London, in 1895-97, and at St. Andrew's, Chatham, in 1900-02. In 1903-06 he was secretary of Dr. Barnardo's Homes and with Mrs. Barnardo he edited *The Memoirs of Dr. Barnardo* (1907). Becoming greatly interested in hygienics and eugenics, in 1911 he was consecrated for the work of public morals in Westminster Abbey by the Lord Bishop of Durham and F. B. Meyer; and he became director of the National Council for Race Regeneration and editor of *Prevention*, an organ of the movement. He wrote: *Theories of the Resurrection* (1899); *a Life of Dr. Paton* (1909); *The Nation's Morals* (1910); a sketch of A. Russel Wallace in *Wallace's Revolt of Democracy* (1913); *The Master Problem* (1915).

MARCHANTIA, mār-kān'shī-ā. One of the bryophytes (q.v.).

MARCHANTIALES, mār-kān'shī-ā'lēz. See HEPATICÆ.

MARCHE, ALBERT LECOY DE LA. See LECOY DE LA MARCHE, ALBERT.

MARCHENA, mār-chā'nā. A town of south Spain in the Province of Seville, situated 28 miles east of Seville, on the railroad between Cadiz and Cordova (Map: Spain, C 4). It is a picturesque old town, partly surrounded by the grass-covered remains of Moorish fortifications, and contains a half-ruined palace of the dukes of Arcos (within the close of which is an old Moorish building) and two notable Gothic churches. In the neighborhood are sulphur springs. The surrounding region is fertile, growing fine olives. Pop., 1900, 12,255; 1910, 13,590.

MARCHENA RUIZ DE CASTRO, rōō-ēth' dā kās'trō, José (1768-?1821). A Spanish author and journalist, who studied the humanities at the University of Seville, took minor orders, and was for a while professor at the seminary of Vergara. Having been strongly influenced by the theories of the French philosophers, his writings became such that he had to escape to France in order to avoid arrest by the Inquisition in 1792. In France he became intimate with persons of influence, continued his writings, was expelled from France in 1799, declared himself a Bonapartist in 1804, accompanied Murat to Spain in 1808, and was imprisoned by the Inquisition and released by Joseph Bonaparte, who appointed him editor of the *Gaceta*. From 1813 to 1820 he was again an exile. In his day Marchena was one of the best Latinists in the world. As an amusement he published at Strassburg in 1800 what he claimed was a fragment of Petronius' *Cena Trimalchionis* that he had found. After the Latinists of the world had admitted that they could find no fault with the text, ex-

cept his refusal to show the original he claimed to have found and copied, Marchena acknowledged that he had written it himself.

MARCHES, THE (It. *Le Marche*, the boundaries). A name frequently occurring in Italian history as applied to a stretch of territory in the central part of the peninsula, comprising the present provinces of Ancona, Ascoli-Piceno, Macerata, and Pesaro e Urbino (Map: Italy, D 3). The use of "marches" for waste land separating two tribes where the need of rigid boundaries is not felt was common in mediæval Europe.

MARCHESA COLOMBI, mär-kä'zä kö-lôm'bä. A pseudonym of the Italian author Maria Torelli-Torriani (q.v.).

MARCHESI, mär-kä'zä, MATHILDE, née GRAUMANN (1826-1913). A German-French singing teacher, born at Frankfort-on-the-Main. She studied under Nicolai in Vienna and with Manuel García in Paris, afterward appearing as a concert singer in London and on the Continent. Her voice was pleasing but not remarkable. In 1852 she married Signor Salvatore Marchesi (q.v.) and taught singing at the Vienna Conservatory from 1854 to 1861, after which she moved to Paris and succeeded in making her salon one of the most important circles of musical life in the city. She taught at Cologne from 1865 to 1868, then at Vienna for a number of years, but ultimately settled in Paris. She published an *Ecole de Chant* and 24 books of *Vocalises*. In English appeared *Ten Singing Lessons* (1901). Among her pupils were Tremelli, Caroline Sulla, Emma Schuk-Proska, Gerster, Melba, Eames, Calvé, Sibyl Sanderson, and her own daughter Blanche, who afterward sang, especially in opera, in England and on the Continent. Consult the autobiographical *Marchesi and Music: Passages from the Life of a Famous Singing Teacher*, with introduction by Massenet (New York, 1897).

MARCHESI, POMPEO CAVALIERE (1789-1858). An Italian sculptor. He was born at Saltrio, near Milan, and studied at Rome under Canova. He was for many years professor of sculpture at the Academy of Milan. Some early and rather clumsily executed statues by him are in Como Cathedral, which also contains a relief of the "Death of St. Joseph," his latest and one of his most admired works. He contributed largely to the decoration of the Arch of Peace at Milan, the relief commemorating the "Battle of Leipzig" and "Drowning of Prince Poniatowsky" deserving special mention. His later works include the sitting statue of Goethe for the Frankfort Library, a statue of Emperor Francis I of Austria for Graz, and another for the Hofburg in Vienna. One of his largest but not most pleasing works is the colossal group for the church of San Carlo at Milan, in which is the figure of the famous "Mater Dolorosa." The excessive sentimentality which characterizes most of his religious compositions is particularly visible here. Much better is the sepulchral monument for Duke Emmanuel Philibert of Savoy (1843) in the Turin Cathedral.

MARCHESI, SALVATORE (1822-1908). A celebrated Italian barytone and singing master, born at Palermo. He was a nobleman, his full title being Cavaliere di Castrone, Marchese della Rajata. While studying law and philosophy at Palermo he also had his voice cultivated by Raimondi. In Milan he continued his musical studies under Lamperti and Fontana. Because of participation in the revolution of 1848 he had to

flee, and came to America. His operatic début made in New York, he went to London for further study under García. After his marriage to Mathilde Graumann, who later became famous as Madame Marchesi, he and his wife appeared with great success in concert and opera in England and on the Continent. In 1854 both accepted positions at the Vienna Conservatory, but soon went to Paris. In 1865 they were called to the Cologne Conservatory, and in 1869 once more to Vienna. From 1881 to his death he resided in Paris. He wrote a number of successful songs, vocalises, and a *School for Singing*.

MARCHFELD, märk'fêlt. A large plain on the north bank of the Danube, opposite Vienna. It is bounded on the east by the river March. It contains only a few villages. Because of the physical characteristics this has been a noted battlefield. Here Marcus Aurelius contended with the Marcomanni. In 1260 King Ottokar of Bohemia defeated Béla IV of Hungary on the Marchfeld. On the same plain in 1278 Ottokar was defeated by Rudolph of Hapsburg and slain. In modern times the most important battles fought on the Marchfeld were those of Aspern (q.v.) and Wagram (q.v.) in 1809.

MARCH FLY. Any one of the dipterous insects of the family Bibionidæ, so called because these flies are most common in the early spring. They are of medium size, rather thick-bodied and rather hairy, but they are weak fliers. The wings are frequently fuscous. More than 300 species are known. The larvæ feed upon excremental or vegetable substances and are supposed to attack the roots of growing grass. The larvæ of some species have been found on the surface of snow. One of the commonest species in the United States is the white-winged bibio (*Bibio albipennis*), which sometimes occurs in enormous numbers. The smallest forms belong to the genus *Scatopse* and breed in decaying animal and vegetable matter.

MARCHIENNE-AU-PONT, mär'shë'n'ô'-pôn'. A town in the Province of Hainault, Belgium, 2 miles west of Charleroi, on the Sambre River (Map: Belgium, C 4). It is an important coal-mining centre, has an industrial school and manufactures of iron, machinery, and glass. Pop., 1900, 18,461; 1910, 21,635.

MARCHING. General Principles. A successful march, whether in peace or war, is one that places the troops at their destination at the proper moment and in the best possible condition. In war marches are of daily occurrence, and success depends in a great measure upon the skill with which they are conducted. Good marching is secured by careful preparation, strict discipline, and the due observance of march sanitation. While conforming to other requirements, marches are conducted so as to reduce to a minimum the hardships of the troops. When possible ample notice is given so that preparations can be made without haste. The march is habitually at route order. Troops are informed of the length of halts so that they can take full advantage of the same. The men are not kept under arms longer than necessary, nor required to carry heavy burdens when transportation is available. Special care is paid to the feet of the men and to the hoofs and backs of animals. In prolonged marches at least one day in seven should be a day of rest. A forced march is never undertaken unless the situation requires it. As a rule troops on the march pay no compliments; individuals salute

when they address, or are addressed by, a superior officer. The conduct of a march (forming the column or columns, distribution of troops, start, rate, length of march, etc.) is controlled by the situation and object to be accomplished.

Forming the Column.—To form the column a "march order" is issued by the superior commander. This order states the object of the march, gives the distribution of the troops, order of march of the main body, and the manner of forming the column. In drafting such orders the road space and rate of march of the different fractions of the command and their distances from the *initial point* must be considered. With foot troops and cavalry marching four abreast, artillery and trains in single column of carriages, the following may be assumed for approximate calculations: two men per yard for foot troops, one man per yard for each mounted man, 20 yards for each gun, caisson, or wagon, and 12 yards for each auto truck. **Distribution of Troops.**—The order of march of a column is controlled mainly (1) by tactical considerations, which are paramount in the presence of the enemy, and (2) by the rule requiring the hardships of troops to be reduced to a minimum. During an advance the order of march of a column is generally as follows, the necessary security being provided: combatant troops (with combat trains): 1, cavalry and horse artillery; 2, infantry and light or mountain artillery; 3, engineers and signal troops; 4, trains, etc. During a retreat this order of march is reversed. A detachment of engineers marches near the head to repair bridges, etc. Infantry usually marches in column of squads, column of twos when necessary; cavalry in column of fours on good roads, otherwise in column of twos; artillery in section or double-section column, depending on the width of the road. **The Start.**—When practicable, marches begin in the morning, ample time being allowed for the men to breakfast, animals to feed, and the animals and wagons to be packed. Foot troops do not start before broad daylight; mounted troops, when practicable, about an hour after broad daylight. Too early a start is inadvisable, as both men and animals rest better in the early morning hours.

Rate and Length of Marches. The rate of march of a mixed command is regulated by that of the foot troops. For *infantry* the rate prescribed for *drill* is 100 yards a minute or 3.4 miles an hour; *on the road* the maximum to be counted on is 88 yards a minute or 3 miles an hour; including halts this rate is reduced to $2\frac{1}{2}$ to $2\frac{3}{4}$ miles. The rate of infantry columns under average road conditions may be assumed at $2\frac{1}{4}$ to $2\frac{1}{2}$ miles per hour. The average march of infantry is 15 miles a day; large bodies, 12 miles. Small bodies under favorable conditions may average 20 miles. For *cavalry* the *drill* rate is: walk, 4 miles; trot, 8 miles; gallop, 12 miles per hour. The average walk of a horse is at the rate of a mile in 16 minutes, or $3\frac{3}{4}$ miles an hour; the average trot a mile in 8 minutes, or $7\frac{1}{2}$ miles an hour. *In the field* the usual gait is the walk of $3\frac{3}{4}$ miles per hour; including halts, $3\frac{1}{4}$ to $3\frac{1}{2}$ miles per hour. The average march of cavalry, after men and animals are hardened, is 25 miles a day.

The daily march of *field artillery* is the same as that of the command of which it forms a part; if alone, it covers from 15 to 20 miles.

The rate of a *wagon train* under average conditions in long columns is about 2 miles per

hour, including halts. Small trains may make $2\frac{1}{2}$ miles. The daily march is the same as infantry.

The average load of a *pack mule* is 250 pounds, and thus loaded a pack train can travel 20 to 25 miles a day over ordinary roads; over rough country, 10 to 15 miles. The rate of auto trucks varies with the road and truck. **Halts.**—As a rule infantry halts 15 minutes after the first three-quarter-hour march; thereafter 10 minutes every hour. Cavalry 5 minutes every hour. Artillery from 5 to 10 minutes.

Marches may be classified as follows: 1. *Marches in peace*, which include changing station and practice marches. 2. *Marches in campaign*, which include concentration marches, marches in the presence of the enemy, forced marches, and night marches. In *changing station* marches are conducted almost solely with reference to the comfort of men and animals and facility of supply and camping, as such marches do not involve tactical considerations. *Practice marches* have for their purpose hardening the men and animals and instructing officers and men in campaign duties. *Concentration marches* assemble at a certain time and place bodies of troops from different localities. Computation of time and road space is important. *Marches in the presence of the enemy* are controlled solely by tactical considerations, and require the use of certain troops, for information and security, disposed as advance, flank, and rear guards, for the protection of the main body of troops. If the command is a division the following is a not unusual disposition: *advance guard*, consisting of one brigade of infantry, all of the divisional cavalry, one battalion of artillery, one company of engineers, a detachment of signal troops, and a detachment of the sanitary train. Following this, with a distance of from $\frac{1}{2}$ to 1 mile, is the *main body*, in order of march as follows: one regiment infantry, one battalion of artillery, a regiment of artillery, two brigades infantry (less one regiment), engineers, signal troops, artillery combat trains, trains. A division at war strength consists of 22,000 men, 7500 animals, and 900 vehicles. With its field trains, closed up without distance, a division will occupy about 12 miles of road.

Forced Marches are not made unless absolutely necessary, as they seriously impair the fighting power of the best troops. A maximum day's march of infantry and trains is about 28 to 30 miles. Such a march should not be prolonged more than 36 hours. Under favorable conditions cavalry and field artillery may march at a rate of 50 miles in 24 hours for three or four days. Under very favorable conditions a *single* march of 100 miles can be made in from 24 to 30 hours.

Night Marches are sometimes made in hot weather, but usually to surprise the enemy or to secure a favorable position to attack at night or at dawn. Special precautions must be taken to keep the units in touch and in the proper roads or trails. If secrecy is required special instructions are given with regard to smoking, lights, talking, etc. Cavalry follows infantry; the artillery is in rear with a special infantry escort.

French infantry has always had a reputation for rapid marching. In June, 1914, the 166th regiment of (fortress) infantry marched 55.8 miles in 36 hours without having a man drop out. During former Indian campaigns troops

and squadrons of United States cavalry were credited on their records, on more than one occasion, with a distance of 110 miles in 24 hours. Consult *Field Service Regulations, United States Army* (Washington, 1914).

MARCHING THROUGH GEORGIA. A widely popular ballad of the Civil War, beginning "Bring the good old bugle, boys." It commemorates Sherman's famous march to the sea and was written by H. C. Work soon after the march commenced, on Nov. 16, 1864.

MARCHIONESS, mär'shün-ës, THE. In Dickens's *Old Curiosity Shop*, a small servant to Sampson Brass, and a friend of Dick Swiveller.

MARCHMONT, märch'mont, ARTHUR WILLIAMS (1852-). An English novelist, born at Southgate, Middlesex, and educated privately and at Pembroke College, Oxford. In 1888 he entered Lincoln's Inn. Up to 1894 he devoted himself to journalism in London and the provinces, editing at one time the *North Eastern Daily Gazette* and later the *Lancashire Daily Post* and contributing constantly to reviews and magazines. In 1894 journalism was abandoned for fiction, in the production of which this author was prolific; witness, among others, the novels: *Isa* (1887); *By Right of Sword* (1897), dramatized, and produced in America (1902); *Sarita the Carlist* (1902); *The Queen's Advocate* (1904); *The Man who was Dead* (1907); *An Imperial Marriage* (1909); *In the Name of the People* (1911); *The Mystery of Egrave Square* (1912); *When Love Called* (1913); *The Heir to the Throne* (1914).

MARCIANISE, mär'chà-nē'zà. A town in the Province of Caserta, Italy, 18 miles by rail from Naples, in a low, unhealthy plain, where are several small lakes. Weaving of flax and hemp and the raising of fruits and grain constitute the principal industries. Pop. (commune), 1901, 12,785; 1911, 13,465.

MARCIL, mär-sel', CHARLES (1860-). A Canadian journalist and statesman. He was born at Ste. Scholastique, Province of Quebec, was educated at Ottawa College, and in 1879-81 was on the staff of the *Montreal Gazette*. He was with the *Montreal Herald* (1882-86), the *Montreal Post* (1886-96), and afterward with *La Patrie* and the *Star*, of the same city. He was an unsuccessful Liberal candidate for the Quebec Legislative Assembly (1897), but was elected to the House of Commons for Bonaventure in 1900. He became Deputy Speaker of the House in 1905, and was Speaker thereof in 1909-11. In 1911 he was appointed a member of the King's Privy Council for Canada, and in the same year was made an honorary vice president of the Universal Races Congress at London, England. He acquired a wide reputation as a public speaker.

MARCION, mär'shon. A second-century Christian, classed among the heretics. He was born in Sinope, Pontus, and died after 160. About the year 140 he came to Rome, where he fell under the influence of the Syrian Cerdo (see CERDONIANS), from whom his Gnostic ideas were perhaps derived, and here he founded his church. He afterward traveled through the East, visiting Rome again in the episcopate of Anicetus (154-165). Nothing is known of his later life. His disciples, chief among whom was Apelles, continued his work, and Marcionite churches were soon to be found scattered over north Africa, Gaul, Asia Minor, and Egypt.

It is said that Polycarp (q.v.) once met Marcion in the streets of Rome and saluted him as "the first-born of Satan." In this he gave expression to the general sentiment of the Church, for Marcion was attacked by almost every orthodox writer from Justin onward. Yet Marcion regarded himself in the light of a reformer. He believed that Christianity marked an essentially new departure, but that it had already become corrupted through the admixture of Jewish elements. These must be purged out. For him Paul was the only true Apostle, because he alone thoroughly abjured Judaism. These principles appear in Marcion's Scripture canon—the earliest Christian collection known—which embraced one Gospel (Luke, without the story of the infancy, which was "Jewish") and 10 of Paul's Epistles (omitting those of Timothy and Titus). Church writers accused him, with apparent justice, of "mutilating" the Scriptures. His own chief work, entitled *Antitheses*, set forth the alleged contradictions between Law and Gospel. The Creator of the Old Testament was represented as a cruel and vindictive being, wholly different from the God of love revealed through Christ. Marcion's Christology was docetic, i.e., he taught that Christ suffered only in appearance, for neither suffering nor a material body could be supposed of the Divine. (See DOCETÆ.) Since matter was regarded as evil, his ethics resulted in a severe asceticism. His Gnostic tendency appears in the dualistic tenet that man's body cannot be saved, only his spirit, which is the opposite of matter. This was a striking departure from the common Christian belief. An attempt has recently been made to prove that the old Roman symbol, which lies at the basis of the Apostles' Creed, was formed to combat Marcion's Gnosticism. The Marcionite church was completely organized, having its clergy, its rites, and its Scriptures. The sacrament of baptism was administered much as in the orthodox Church, but in the Eucharist water was substituted for wine. In the East Marcionite churches are found as late as the sixth century, but in the West they disappeared earlier, being absorbed by the more virile Manichæans. (See MANICHÆISM.) Their downfall was due in part to ecclesiastical opposition and in part to hostile legislation under Christian emperors from Constantine onward. In the persecutions through which they passed not a few Marcionites suffered a martyr's death, and the property of their churches was declared forfeited to the Catholic church. Consult, for information as to the surviving fragments of Marcion's works, C. T. Crutwell, *Literary History of Early Christianity* (London, 1893), and Gustav Krüger, *History of Early Christian Literature* (New York, 1897). Among the sources, consult the interesting work of Tertullian, *Against Marcion*, translated in *The Ante-Nicene Fathers*, vol. iii (New York, 1905). In general, consult: Adolf Harnack, *History of Dogma*, vol. i (Boston, 1894), and Wace and Piercy (eds.), *Dictionary of Christian Biography and Literature* (ib., 1911).

MARCKE, EMILE VAN. See VAN MARCKE, EMILE.

MARCKS, ERICH (1861-). A German historian, born in Magdeburg and educated at the Gymnasium there and in the universities of Strassburg, Berlin, and Bonn and in Paris and London. He was docent at Berlin (1887-92) and became professor of modern history at Freiburg (1892), Leipzig (1894), Heidelberg (1901),

Hamburg (1907), and Munich (1913). At Leipzig he was an editor of *Leipziger Studien aus dem Gebiet der Geschichte*. With the exception of an incomplete biography of Coligny (1892), a study of Queen Elizabeth of England (1897), and some local historical works, Marcks's published books deal with modern personages and problems, especially in Germany and England. They include: *Kaiser Wilhelm I.* (1897; 7th ed., 1910); estimates of Ludwig Häusser (1903) and of Treitschke (1906); several volumes on Bismarck, notably the first volume of a biography (1909); *Deutschland und England* (1900; also in English as *England and Germany*, 1900); *Die imperialistische Ideen in der Gegenwart* (1903); *Biographical Essays* (1905-08); *Einheitlichkeit der englischen Auslandspolitik* (1910); the popular *Männer und Zeiten* (1911); *Historische und akademische Eindrücke aus Nordamerika* (1913).

MARCO BOZZARIS. A well-known poem by Fitz-Greene Halleck on the death of the Greek patriot Bozzaris (q.v.). It appeared in the *New York Review* in 1825.

MARCO DA OGGIONE, mär'kô dä ôd-jô'nâ. An Italian painter. See OGGIONE, MARCO DA.

MARCOMAN'NI (Lat., from OHG. *Markaman, border man, from *marca*, border + *man*, man). An ancient German people who, in the time of Cæsar, lived along the banks of the Rhine, but afterward, as appears from Tacitus and Strabo, settled in Bohemia, from which they expelled the Boii. Their King, Maroboduus, entered into an alliance with the tribes living around them to defend Germany against the Romans. The combined forces of the alliance numbered 70,000 men, and the Emperor Tiberius signed a treaty with them in 6 A.D.; but the Marcomannic alliance was defeated 11 years later by the Cherusci and their allies; and in 19 the Gothic Catualda drove Maroboduus from the throne and himself usurped the sovereignty. But he was soon overthrown and the native dynasty established, under whose rule the Marcomanni extended their territory up to the Danube, till their encroachments alarmed the Romans, who attacked them in the time of Domitian. This war, which subsided for a time in the reigns of Trajan and Hadrian, broke out again under Marcus Aurelius, and was carried on with bitterness from 166 to 180, when it was ended by the Peace of Commodus. The Marcomanni continued to make raids into the provinces of Noricum and Rætia, and in 270 invaded Italy as far as Ancona. In the fourth century their name fades away from history; it has been held that the Marcomanni were merged with the Boiarii or Baiouarii, later known as the Bavarians. See BAVARIA, *History*.

MARCONI, mär-kô'nê, GUGLIELMO (1874-). An Italian electrical engineer, inventor of the wireless telegraph. He was born of an Italian father and an Irish mother at Bologna, April 25, 1874. After study under Rosa at Leghorn he entered the University of Bologna. There he came in contact with Professor Righi, who had long been interested in the nature of the Hertzian waves. The young man saw the possibilities of using these waves for the transmission of messages, improved the coherers of Onesti and Branly, made several successful experiments at Griffone in 1895, and in 1896, having failed to interest the Italian government in his behalf, went to England, where his plans were laid before the post-office authorities.

There his project was well received and successful tests were made between Penarth and Wiston. Sir William Preece, engineer in chief of the British telegraph system, who had himself made experiments in 1893 and 1894, took up the new method, tested it, and declared it successful, but limited in application. Almost immediately afterward tests of the Marconi method were made by the Italian Ministry of Marine at Spezzia. In 1897 the Marconi Wireless Telegraph Company, Limited, was founded and two years later signals were successfully exchanged across the English Channel, and the system was established pretty generally in the British and Italian navies, although at the time some insular jealousy was aroused in England that the scheme of a foreigner should be adopted in view of Preece's early study of the problem.

In December, 1901, Marconi sent signals to Newfoundland from his station at Poldhu on the coast of Cornwall, and on Dec. 19, 1902, he succeeded in transmitting messages between Poldhu and the permanent station erected at Glace Bay, Nova Scotia, this being the first occasion of the transatlantic transmission of wireless messages. Previously, however, in February, 1902, Marconi had been able to maintain communication between the transatlantic steamship *Philadelphia* and Poldhu for a distance of 2099 miles in the case of test letter signals and for 1551 miles for actual messages. These experiments proved the possibility of constant long-distance communication between vessels at sea and the mainland, as well as the general advance of the art. By 1903 Marconi was able to begin the transmission of news messages between America and Great Britain for the London *Times*, and during the same year continuous communication was maintained between land and the steamship *Lucania* during her entire crossing, so that news messages could be supplied to the vessel. Similar communication was maintained between Poldhu and the British warship *Duncan*. By 1904 over-sea transmission was developed to a point of efficiency and reliability, so that a daily newspaper containing the news of both Europe and America could be published on the vessels of the Cunard line. In 1907 a limited commercial service across the Atlantic for public use was established, and from that time its use increased without, however, making any serious inroads into the business of the submarine telegraphs. In the meantime his experimental work continued and he invented a directive system of wireless, as well as a new persistent wave system, which was brought out in 1906. The underlying physical considerations were studied and apparatus—notably new detectors and generators giving the form of wave desired—was evolved which increased the efficiency of the transmission and reception of messages.

About 1910 Marconi brought out a new valve receiver and a new electrolytic detector. He also developed about this time a duplex system by which the sending and receiving devices are rendered operative and inoperative alternately in rapid succession, avoiding synchronism at the two stations. By this time the Marconi Company had developed its transatlantic service on a practical basis, and its station in Argentina was able to receive signals from Nova Scotia and from Ireland, a distance of 5600 miles, which was extended to other South American stations, making an aggregate of 7000 miles.

The promotion of the Marconi companies both

in Great Britain and in the United States was not free from unfavorable comment. In fact, in 1912 charges were made that Premier Asquith, Chancellor Lloyd George, and other members of the British cabinet had corruptly favored the Marconi Wireless Telegraph Company and had benefited through speculation in its stock. The subject was investigated by a parliamentary committee and in May, 1913, Marconi was placed on the stand. He replied vigorously to the various charges and insinuations both technical and commercial. No general blame attached to him in this connection and the cabinet members were regarded as having been only indiscreet, but for the time being the incident was conspicuous in British politics.

On May 1, 1913, an advisory committee of Parliament reported that the Marconi system alone was certainly capable of meeting the requirements for the Imperial wireless chain, but that the company need not be employed as contractors for all the work, and that it was not necessary to employ exclusively the apparatus of the company then in use, as further developments might be reasonably expected. In the meantime the business of the Marconi system had developed broadly and it was employed generally on the vessels of the British merchant marine and at various colonial stations, as well as throughout the United Kingdom. When Italy entered the European War (June, 1915), Marconi took charge of the wireless for his government. He was decorated with the Russian Order of St. Anne, the Italian Order of St. Maurice and St. Lazarus, and with the Grand Cross of the Crown of Italy; and he received the freedom of the city of Rome (1903). In 1904 Oxford and Glasgow gave him honorary degrees; he became a Chevalier of the Civil Order of Savoy (1905); received the Grand Cross of the Order of Alphonso XII; and with Ferdinand Braun shared the Nobel prize for physics (1909). He received the British G.C.V.O. in 1914 and in the next year was nominated a Senator of the Kingdom of Italy. See WIRELESS TELEGRAPHY.

MARCO POLO. See POLO, MARCO.

MARCOS, FRAY. See NIZA, MARCOS.

MARCOT, mär'kō', JEAN BAPTISTE ANTOINE MARCELIN, BARON DE (1782-1854). A French soldier, born at La Rivière, Corrèze. He left the Collège de Sorèze in 1799; served in the Republican army in Italy under his father, Gen. Jean Antoine Marcot; and was rapidly promoted until he became aid-de-camp to Marshal Augereau in the Russian and Prussian campaigns of 1806-07. He was with Lannes and Massena in the Peninsular War, and in 1812-13 was colonel of light cavalry in the Russian and German campaigns. During the Hundred Days he served as a general of brigade under Napoleon, and for this was exiled upon the Second Restoration. He returned to France in 1819; became a *maréchal de camp* in 1830 and a lieutenant general in 1836; was made a peer of France in 1845; and retired in 1848.

MARCOU, mär'kō', JULES (1824-98). A French geologist, born in Salins in the Department of Jura. He was educated in Paris and, after completing his course at the Collège St. Louis, made geological excursions through the Alps. In 1846 he was attached to the mineralogical department of the Sorbonne and conducted geological investigations in various parts of Europe and from 1848 to 1850 in the United

States and Canada. In 1853-54 he was employed by the United States government in surveying the Rocky Mountains, but he returned in 1855 to Europe to accept the chair of paleontological geology in the Polytechnic School of Zurich. In 1860 he again visited the United States and was engaged with Prof. Louis Agassiz in paleontological researches, and afterward entered the government service. He died at Cambridge, Mass. He published two fine geological maps, one of the United States in 1853, another of the world in 1862 (2d ed., 1875). Marcou became best known, perhaps, for his *Recherches géologiques sur le Jura salinois* (1848) and *The Taconic System and its Position in Stratigraphic Geology* (1885). He published many scientific papers besides the following more extended works: *Geology of North America* (1858); *De la science en France* (1869); *Origin of the Name America* (1875); *First Discoveries of California, and the Origin of its Name* (1878).

MARCOUX, mär'kō', JOSEPH (c.1770-1855). A Canadian missionary. He was born in Canada, was educated for the Catholic priesthood, after his ordination was sent as a missionary to the various Iroquois tribes, and in 1819 settled among them at Caughnawaga, on the south shore of the St. Lawrence River. His persevering labors resulted in imparting a considerable degree of civilization to the Indians, and he built a schoolhouse and church at Caughnawaga for their benefit. He became a master of the Iroquois language, of which he wrote a grammar and dictionaries. He also published in that language: *The Life of Christ*; *Letters to Iroquois Chiefs* (1848-49); *Prayer Book* (1852); *Catechism* (1854).

MARCOUX, VANNI (1879-). A French basso, born at Turin, Italy. Having received a liberal education, he was admitted to the bar and began to practice law; but, as his musical talent showed itself early, he also devoted much time to the serious cultivation of music, studying with Collino of Turin and later with Boyer at Paris. At his debut in Paris he immediately attracted attention because of his striking and quite exceptional power of characterization. From 1905 to 1912 he appeared every season at Covent Garden in London. In 1912 he became a regular member of the Boston Opera Company. His repertory is very extensive, including almost all the important rôles in older and modern French and Italian operas. He created the title rôle in Massenet's *Don Quichotte*.

MAR/CUS, SAINT. Bishop of Rome, or Pope, Jan. 18 to Oct. 7, 336. He was a native of Rome and is said to have had a share in the building of two churches, one of which still remains as San Marco, although frequently altered and repaired.

MAR/CUS AURELIUS ANTONINUS. See AURELIUS.

MARCUS AURELIUS CLAUDIUS. See CLAUDIUS II.

MARCUS AURELIUS OLYMPIUS NEMESIANUS. See NEMESIANUS.

MAR/CY, MOUNT. The loftiest of the Adirondack Mountains and the highest point in New York State, situated in Essex Co., 10 miles south of Lake Placid (Map: New York, G 2). It is 5344 feet high and was known to the Indians as *Tahavus*, the "cloud divider." Within a few miles of it are many other famous Adirondack peaks, such as McIntyre Mountain (5112 feet), Mount Skylight (4920 feet), Mount Hay-

stack (4918 feet), Basin Mountain (4825 feet), Mount Redfield (4606 feet), and Saddleback Mountain (4530 feet).

MARCY, HENRY ORLANDO (1837–). An American surgeon, born at Otis, Mass. In 1863 he volunteered in the Union army as assistant surgeon. He was assistant in chemistry at Harvard after the close of the war; then studied surgery at Berlin (1869) and in England under Lister, and devoted himself especially to the bacteriology of wounds. He was president of the American Academy of Medicine in 1884, and of the American Medical Association in 1892. Marcy wrote *Best Methods of Operative Wound Treatment* (1882), *The Perineum: Its Anatomy and Surgical Treatment* (1889), and the very valuable work *Anatomy and Surgical Treatment of Hernia* (1892).

MARCY, RANDOLPH BARNES (1812–87). An American soldier, born at Greenwich, Mass. He graduated at West Point in 1832. He was assigned to the United States regular infantry, and was chiefly engaged against the Indians until the outbreak of the Mexican War, for his services in which he was promoted captain (1846). Subsequently he was engaged in explorations in the Red River country (1852), in operations against the Seminoles (1857), and in the Utah expedition of 1857–58. He was appointed paymaster, with the rank of major, in 1859, and inspector general, with the rank of colonel, in 1861. During the Civil War he was chief of staff to General McClellan (his son-in-law), in West Virginia, on the Peninsula, and in Maryland; and in 1865 was brevetted major general in the regular army for faithful and meritorious services during the war. In 1869, after performing inspection service in a number of military departments and as inspector general of the military division of Missouri, he was appointed inspector general of the United States army, with the rank of brigadier general, and was president of the Army Regulation Board until Jan. 1, 1881, when he retired from active service. He contributed largely to magazines, and published: *Exploration of the Red River* (1853); *The Prairie Traveler* (1859); *Thirty Years of Army Life on the Border* (1866); *Border Reminiscences* (1871).

MARCY, WILLIAM LEARNED (1786–1857). An American statesman, born Dec. 12, 1786, at Southbridge, Mass. He graduated at Brown University in 1808 and entered upon the practice of law at Troy, N. Y., in 1810. At the opening of the War of 1812 he entered the volunteer service as a lieutenant, and on Oct. 22, 1812, led a successful attack upon St. Regis, a Canadian post. For this he was soon afterward promoted to be captain. Before the end of the war he returned to Troy, where he was active as a newspaper writer and politician, supporting the Tompkins faction against the Clintons, and allying himself with the "Albany Regency" (q.v.). After filling several minor offices, and after a service of six years as Comptroller of the State, he was made an associate justice of the New York Supreme Court in 1829. In 1831 he was elected Senator of the United States by the Democratic party, but resigned the office upon being chosen Governor of New York in 1832. In the Senate he served as chairman of the Judiciary Committee, and gained distinction by his defense of Martin Van Buren against the attacks of Henry Clay. In the course of a speech on the question of appointment to office

he upheld the right of the President to bestow the offices upon his political supporters, saying, "We can see nothing wrong in the maxim that to the victors belong the spoils," thus associating his name in history with the spoils system. He was, however, much more than a spoilsman: "he was a hard-headed, aggressive Democratic partisan, with none of the popular power of his younger rival, Douglas, but with much more caution and political shrewdness." He served as Governor for three terms, and was nominated for a fourth term in 1838, but was defeated by William H. Seward (q.v.). He was then appointed a commissioner on claims against the Mexican government, serving in that capacity until 1842. In 1845 he became the Secretary of War in President Polk's cabinet. His ability in this position was severely tested by the Mexican War. In the presidential campaign of 1848 he supported General Cass. The last and most important public station in which he served was that of Secretary of State during Pierce's administration (1853–57). Among the foreign complications or treaties which demanded action on his part in this capacity were the settling of the Mexican boundary, the Canadian reciprocity treaty, Commodore Perry's negotiations with Japan, the British fishery dispute, the Ostend Conference, and the so-called Koszta Affair (q.v.), which added much to his popularity. In these and in other matters Marcy successfully defended the interests of his country and displayed the qualities of a trained statesman and accomplished diplomat. One of his notable diplomatic papers was his instructions to the American ministers abroad to appear at court "like Franklin in the simple costume of an American citizen" when this could be done without detriment to the interests of the United States. Marcy's death occurred at Ballston Spa, N. Y., but a few months after the expiration of his term of office. He is entitled to high rank as a statesman, while as a shrewd politician he was at his time almost unsurpassed. Consult: J. S. Jenkins, *Lives of the Governors of the State of New York* (Auburn, 1851); J. F. Rhodes, *History of the United States from the Compromise of 1850*, vols. i and ii (New York, 1892); S. Webster, "Mr. Marcy, the Cuban Question, and the Ostend Manifesto" in vol. iii of the *Political Science Quarterly* (ib., 1893); De A. S. Alexander, *Political History of the State of New York* (ib., 1906).

MAR CZALI, mār'tsá-lě, HENRY (1856–). A Hungarian historian, born in Marczali, County Somogy. He was educated at the University of Budapest and, after studying in Berlin, Paris, and London, became lecturer (1880) and professor (1895) of the Historical Seminary of the University at Budapest. He contributed to the great millennial history (in Magyar) of Hungary (1895–1901), edited by Szilagyi; and himself published: *Ungarns Geschichtsquellen* (1882–88); *Hungary in the Times of Joseph II* (1891); *Mary Theresia* (1900–04); *Enchiridion Fontium Historiæ Hungariorum* (1902), in Latin and Magyar; *Hungary in the Eighteenth Century* (1910); *Ungarische Verfassungsgeschichte* (1910); *Ungarisches Verfassungsrecht* (1911).

MARDI GRAS, mār'dé' grā'. See CARNIVAL.

MARDIN, mār-dēn'. The capital of a sanjak in the Vilayet of Diarbekir in north Mesopotamia, Asiatic Turkey (Map: Turkey in Asia, D 3). It is strikingly situated on the steep slopes of a conical hill 5000 feet above sea

level, crowned by the ruins of an old castle. It has a number of mosques, bazars, and baths, as well as Christian churches and monasteries, and is the seat of an important American mission with a church and a school. It is also the seat of the Jacobite Patriarch of Antioch, who occupies an ancient and interesting monastery not far from the city. It is also the headquarters of a Roman Catholic archbishop. Pop., about 25,000, of whom less than one-half are Moslem Kurds; the rest are Christians of various Eastern sects.

MARDONIUS (Lat., from Gk. *Μαρδόνιος*, *Mardonios*, from *OPers. Marduniya*). A Persian general, son of Gobryas and son-in-law of Darius Hystaspes. In 492 B.C. he commanded an expedition sent out by Darius to punish the Eretrians and the Athenians for the aid they had given to the Ionians. (See GREECE, *Ancient History*.) Near Mount Athos, however, his fleet was destroyed by a storm, and when, shortly afterward, his land forces were cut to pieces, he returned to Asia and was relieved of his command by Darius. On the accession of Xerxes he was restored to favor and was appointed one of the generals of the expedition against Greece. After the battle of Salamis (480 B.C.) he was left by Xerxes with 300,000 men to conquer Greece. In the following year, 479 B.C., he was defeated and probably slain in the battle of Plataea, by the Greeks under Pausanias. Consult Herodotus, vi, 43-45, 94; vii, 5, 9, 82; viii, 100 et seq., 113 et seq., 133-144; ix, 1-4, 12-15, 38-65, and the editors on these passages. Consult also the standard histories of Greece.

MARDUK. See MERODACH.

MARDUK, mār'dōōk. The chief god of Babylon. An older form of the name seems to have been *Maruduk*. He was manifestly a Sumerian divinity. Since he is represented as a son of Ea, the god of Eridu, it is possible that a dynasty of Eridu established itself in Babylon between the dynasty of Uruk and Ur Engur of Ur, with Marduk as its chief god. For some centuries previous to this the city probably had a prevalently Akkadian population, as the Semitic god Nabu appears to have established for himself so strong a position that it had to be recognized even in later times. With the growth of Babylon the importance of its great god increased. When Hammurapi's conquest of Larsa, made in 2094 B.C., made it the capital of all Babylonia, Marduk naturally tended to become the head of the Babylonian pantheon, and he was greeted as "King of the gods," "King of heaven and earth," "Lord of lords, king of kings." The Semitic population also seems to have called him Bel, he is addressed as Bel at the end of the Code of Hammurapi and elsewhere, and hence the Hebrews also spoke of him as Bel or Bel Merodach (q.v.). In Eridu Marduk seems to have been a sun god, and it was probably there that the myth developed according to which he became the creator of the present world and of mankind after his conquest of the chaos monster Tiamat. This myth spread from Babylon to Assyria and even to Syria. In the city of Assur this mighty deed is ascribed to Assur in the time of Sennacherib. Among the Hebrews it is Yahwe who violates Rahab, overcomes Tehom, punishes Leviathan, and creates the world. Later the struggle is transferred to Michael and the Dragon and St. George and the Dragon. In the astral system of the Babylonian sages, which identified the chief deities with the

great stars, Marduk was thought of as connected with the planet Jupiter. The Marduk of Babylon therefore seems to have lost to some extent the solar character that Marduk of Eridu possessed. The spiritual nature ascribed to him as lord of gods and men comes to view in many hymns. In one of these the worshiper prays: "Put truth into my mouth, let good thoughts be in my heart." The great temple of Marduk in Babylon was known as E-sag-ila (the lofty house), and to him was also dedicated the temple tower, called E-temen-an-ki (the house of the foundation of heaven and earth). Both have been laid bare by the excavations of the Deutsche Orientgesellschaft. (See BABYLON; BABEL, TOWER OF.) Consult: Zimmern, in Schrader, *Die Keilinschriften und das alte Testament* (3d ed., Berlin, 1902); Jastrow, *Die Religion Babyloniens und Assyriens* (Giessen, 1902-12); Jeremias, *Das alte Testament im Lichte des alten Orients* (Leipzig, 1906); Rogers, *The Religion of Babylonia and Assyria* (London, 1908); Condamin, in Huby, *Christus: Manuel d'histoire des religions* (Paris, 1913).

MARE AU DIABLE, mār ô dyâ'bl', LA (the devil's pool). A romance by George Sand (1846).

MARÉCHAL, mār-rā'shāl', PIERRE SYLVAIN (1750-1803). A French atheistic writer, born in Paris. He studied law, but became sublibrarian at the Collège Mazarin and held that position until 1784. His parody on the Psalms (1784) caused his dismissal, and four years afterward his *Almanach des honnêtes gens*, a sort of calendar, in which the names of celebrated men were substituted for those of saints, earned him four months in prison. His other works include: *Les voyages de Pythagore* (1799) and a *Dictionnaire des athées anciens et modernes* (1800), in which he was assisted by Lalande, the astronomer.

MARE CLAUSUM, mār-rê klā'sūm or mār-rā klou'sūm (Lat., closed sea). In international law, a body of water, as a bay, a sea, or a great lake, which is under the exclusive jurisdiction of a single power. Usually such a body of water is *mare clausum* when its shores are exclusively possessed by a single power, as is the case with Lake Michigan, which lies wholly within the territory of the United States, and as was formerly the case with the Black Sea before Russia had wrested its northern and eastern shores from Turkey. The doctrine that a nation may by appropriation convert a portion of the open sea into a *mare clausum* was formerly maintained by Great Britain with respect to the Narrow Seas, the North Sea, and the Atlantic from Norway to Spain, by Russia with respect to Bering Sea within 100 miles of the Alaskan and Siberian coasts, and by Sweden and Denmark with respect to the Baltic and Arctic seas, but these pretensions were always disputed and have long since been abandoned. See HIGH SEAS; BERING SEA CONTROVERSY.

MAREE, mār-rē', LOCH. A beautiful lake in Ross and Cromartyshire, northwestern Scotland (Map: Scotland, C 2). It is about 12 miles long by 2 miles wide, and very deep. It is studded with islets, and surrounded by mountains 3000 feet high. It drains by the Ewe over an artificial dam to Loch Ewe.

MARE'IA, or **MA'REOTIS** (Lat., from Gk. *Μαρεώτις*). A salt lake of the Nile delta in the north of Egypt, separated from the Mediterranean by a narrow isthmus of sand on which

is situated the city of Alexandria (Map: Egypt, E 1). Its modern name is Birket or Behêret Maryut. It is some 12 miles long, with width of about the same extent, but in antiquity it is said to have been somewhat larger. The surrounding district was anciently very fruitful and the Mareotic wine had a high reputation. During the Middle Ages the lake dried up because the canals flowing into it from the Nile were choked with sand. In 1801 the English, during the siege of Alexandria, cut through the isthmus west of Abukir, allowed the sea to flow in, and destroyed 150 villages. Mehemet Ali tried to reclaim the resulting salt marsh (6 to 10 feet deep), but with little success. The water of the lake is used for the manufacture of salt by evaporation. Consult Stanley Lane-Poole, *History of Egypt in the Middle Ages* (New York, 1905), and Baedeker, *Egypt* (6th ed., Leipzig, 1908).

MARE ISLAND. An island, about 2 miles long, in Solano Co., Cal., at the east end of the Bay of San Pablo and opposite the city of Vallejo, from which it is separated by a strait half a mile wide. It has ferry connection with that city. On its west shore is situated the Pacific station of the United States navy, its yard being one of the largest in the country. It has a naval arsenal, sectional floating dock, an observatory, and a lighthouse of the first order.

MARE LIBYUM. See LIBYAN SEA.

MAREMMA, mã-rêm/mã (corruption of *Marittima*, "situated on the sea"). A vast marshy region of Tuscany, west Italy, extending along the coast, from the mouth of the Cecina to Orbetello and 15 to 20 miles inland (Map: Italy, C 3). In ancient times these districts were drained, cultivated, and inhabited, but the neglect of watercourses has brought about their malarial condition, which is, however, being again improved, since Leopold of Tuscany in the early part of the nineteenth century began drainage canals. The railway line along the coast has greatly contributed to the improvement of the district.

MARENCO, mã-rêm'kô, CARLO, COUNT (1800-46). An Italian Romantic dramatist, born at Cassolnuovo, resident and mayor of Ceva, Piedmont. He was the author of some 15 tragedies, dealing with mediæval subjects and revealing the influence of Alfieri, and more directly that of Pellico, as well as a tendency to adopt the methods of the historical drama of Romanticism. The most popular of his plays were *Buondelmonte*, *Pia de' Tolomei*, and *Arnaldo da Brescia*. Of these the *Pia* still enjoys some vogue, after being immensely popular in its own day, interpreted by Adelaide Ristori. The *Arnaldo* was overshadowed by Nicolini's famous tragedy of the same title. Consult the edition of his *Tragedie* (Turin, 1837-44); the *Tragedie inedite*, etc. (Florence, 1856); Orlandi, *Il teatro di C. M.* (Florence, 1900).

MARENCO, LEOPOLDO, COUNT (1831-99). An Italian dramatist, born at Ceva, Piedmont. He was the son of Carlo Marenco (q.v.) and wrote his play *Isabella Orsini* when only 20 years old. In 1871 he scored decided triumphs with *Il falconiere di Pietro Ardena* and *Celeste*. His plays, which affect, when most distinctive, a sentimental tone and a mediæval stage setting, include: *Piccarda Donati* (1869); *Saffo* (1880); *Rosalinda* (1884); *Lo spiritismo* (1869); *Il ghiacciaio di Monte Bianco* (1870); *Quel che*

nostro non è (1877); *Giorgio Gandi* (1882); *Bice* (1884). His collected works were published in 20 volumes (1884 et seq.) at Turin.

MARENGO, mã-rêm'gô. A locality near Alessandria, Italy, the scene of one of the most famous of Napoleon's battles, fought on June 14, 1800, in which the French completely defeated the Austrians under General Melas (Map: Italy, B 2). After Napoleon got control of the government he determined to wage a vigorous war against Austria so that she would be unable to help England and Russia. Moreau (q.v.) was sent to Germany, while Napoleon himself crossed the Great St. Bernard Pass into Italy with about 40,000 men. On June 14 Melas crossed the Bormida from Alessandria, assailed the French, and at first was successful, because Napoleon had scattered his troops in an effort to find the Austrians. But at five in the afternoon Desaix (q.v.) and Kellermann (q.v.) appeared with fresh troops and swept all before them, though the former lost his life in the charge. The French lost about 7000 in killed, wounded, and prisoners, while the Austrians lost about 10,000. The battle firmly established Napoleon's supremacy in France. General Melas was compelled to sign the Convention of Alessandria, by which he surrendered Genoa, Piedmont, and the Milanese, and promised to withdraw the Austrian garrisons from all cities to the west of the Mincio. Military critics have generally maintained that the Marengo campaign was one of the most brilliant conceptions in the history of warfare. See NAPOLEON I.

MARENHOLTZ-BÜLOW, mã'ren-hölts-bu'lô, BERTHA VON (1810-93). A German educator and author, born near Brunswick. Attracted by the ideas of Friedrich Fröbel (q.v.), whom she met in 1850, she became his disciple and devoted her life to founding kindergartens in Germany and many other European countries. Her activity in London attracted much attention and is noticed by Dickens in *Household Words*. Among her writings are: *Beiträge zum Verständnis Friedrich Fröbels* (1876); *Der Kindergarten* (2d ed., Dresden, 1878); and a number of pamphlets on the kindergarten, several of which have been translated into English. Consult Goldschmidt, "Bertha von Marenholtz-Bülow," No. 239, in the *Sammlung wissenschaftlicher Vorträge* (Hamburg, 1896), and *Life of Baroness Bertha Marenholtz-Bülow*, by her niece of the same name (New York, 1901).

MARENZIO, mã-rêm'tsi-ô, LUCA (c.1555-99). An Italian composer of madrigals, born at Coccaglio, between Bergamo and Brescia. He was a chorister in the Brescia Cathedral and received musical instruction from its organist, Giovanni Contini. He began publication in Venice (1581), with a collection of madrigals for five voices, and he issued nine books of the same within 10 years. About 1584 he was living in Rome, employed by Cardinal d'Este as maestro di cappella, and in 1587 he had a post at the Polish court, but went back to Rome (1595), and received an appointment in the chapel of the Pope. He composed a quantity of Church music, but it is on account of the great advance he made upon his predecessors in the production of madrigals that he is chiefly remembered. Six books of them for six voices were published in Venice (1582-1609), and he wrote others for three, four, eight, and twelve voices.

MAREOTIS, mã'rê-ô'tis. See MAREIA.

MARET, mǎ'rě', HUGUES BERNARD, DUKE OF BASSANO (1763-1839). A French statesman. At the beginning of the Revolution he was editor of the *Bulletin* (the original of the *Moniteur*), containing the proceedings of the Constituent Assembly, a position which gave him much political influence. At first inclining to the Jacobins, he subsequently favored a constitutional monarchy. In 1792 he became chief of a bureau in the Ministry of Foreign Affairs, and after Aug. 10, 1792, was employed in various diplomatic missions—as Envoy to England, to Naples (1793), and to England again (1797). He coöperated with Napoleon in the coup of the 18th Brumaire (1799). He became Napoleon's confidential adviser, and later his Secretary of State for Foreign Affairs. During the Hundred Days, Napoleon made him Duke of Bassano. He was in exile during the Restoration; but Louis Philippe restored him to the peerage in 1831, and made him the head of a short-lived ministry.

MARETZEK, mǎ're-tsěk, MAX (1821-97). A German-American composer, director, and impresario, born in Brünn, Moravia. He studied music there and also at Vienna and Paris. In 1843 he composed the opera *Hamlet*, which secured him the place of music director at the Royal Opera in London. In 1847 he went to New York, and in 1848 was the musical director at the Astor Place Opera House. In 1849 he commenced his career as an impresario of Italian opera in New York, and continued it until 1878, subsequently teaching. He published in 1855 *Crotchets and Quavers; or, Revelations of an Opera Manager in America*; composed the opera *Sleepy Hollow* (1879); and wrote chamber and orchestral music. He died on Staten Island, N. Y.

MAREY, mǎ'rǎ', ETIENNE JULES (1830-1904). A French physiologist, born at Beaune (Côte-d'Or). He went to Paris when 20 years old, took the degree of doctor of medicine in 1860, and the same year began work in physiology at the Collège de France. In 1864 he established a physiological laboratory, and in 1867 was appointed adjunct professor of physiology in the Collège. He became a lauréat of the Institute and a member of the Academy of Medicine (1872) and of the Institute (1878). He began to publish scientific tracts as early as 1857, and worked on the experimental physiology of the heart and circulation, on animal heat, on the electric phenomena which provoke or accompany movements in animals, and on the action of poisons which especially concern the nerves and muscles. In 1863 he invented the sphygmograph, which has been an important laboratory instrument. His studies and works on motion in animals, especially on the flight of birds and insects, have given him a wide reputation, since he devised photographic methods of recording the motions of the wings. His most important publications were: *Physiologie medicale de la circulation du sang* (1860-64); *Physiologie du système circulaire* (1866); *La methode graphique dans les sciences experimentales* (1878); *Developpement de la methode graphique par l'emploi de la photographie* (1885); *Physiologie du mouvement: le vol des oiseaux* (1890); *Le mouvement* (1894).

MARGADANT, mǎr-gǎ-dǎnt', SIMON LEMM. The real name of the German humanist Simon Lemnius (q.v.).

MAR'GARET (1353-1412). Queen of Den-

mark, Norway, and Sweden. She was the second daughter of Valdemar IV, King of Denmark, and the wife of Haakon VI, King of Norway, whom she married in 1363. On the death of her father without direct male heirs, the Danish nobles, after an interregnum, offered the crown in 1376 to Margaret and her husband in trust for their infant son Olaf. By the death of Haakon in 1380 Margaret became sole guardian of the young Prince, who died in 1387. Such was the skill with which she had conducted the government that the estates of both kingdoms concurred in electing her as their joint sovereign. She nominated her cousin, Eric of Pomerania, her successor; and although, owing to Eric's infancy at the time, and his subsequent incapacity, the real power rested in the hands of Margaret, she contented herself from that time with the title of "Margaret, by the grace of God, daughter of Valdemar, King of Denmark." At the moment that Margaret was cementing the union of Norway and Denmark, the condition of affairs in Sweden opened the way for a further extension of her power. The Swedish King, Albert of Mecklenburg, had so thoroughly alienated the affections of his subjects that the nobles declared the throne vacant and offered to acknowledge Margaret as their ruler. The Queen lost no time in sending an army into Sweden to support her pretensions, and defeated the King's German troops at Aasle near Falköping in 1389, where Albert fell into her hands. The King remained in prison till 1395, during which time Margaret continued the work of subjugating Sweden. In 1397 she effected the so-called Union of Kalmar (q.v.), by which the crowns of the three Scandinavian kingdoms were henceforth to remain united. Eric, who was in his sixteenth year, was invested with the triple dignity. Margaret continued to exert great influence in the government. She died towards the close of 1412, while she was attempting to bring about peace between Eric and the Duke of Holstein. Consult M. Hill, *Margaret of Denmark* (London, 1898).

MARGARET, or **MARGUERITE**, mǎr'g'rět' (variously called of ANGOULÊME, of ORLÉANS, of ALENÇON, and of NAVARRE) (1492-1549). A daughter of Charles of Orléans, Count of Angoulême, sister of King Francis I of France. She was born at Angoulême, April 11, 1492. In 1509 she married the Duke d'Alençon, and two years after his death (1527) Henri d'Albret, titular King of Navarre. His small dominions, for Francis I failed to reconquer the entire Kingdom as he had promised, she governed after his death in 1544. Their daughter, Jeanne d'Albret, became mother of Henry of Navarre (Henry IV of France). Margaret was active in politics, in religious reform, and in literature. Of a strong mystical tendency, she favored religious liberty rather than Protestantism, and was the leading exponent of the Neoplatonic movement which was cultivated for a while within a restricted milieu. During the ascendancy of her influence with her brother, she was an effectual defender and patron of humanists and men of letters of such varied complexion as Rabelais, Marot, Des Périers, Dolet, Peletier, Brodeau, and many others. Her little courts at Nérac and at Pau, for a time the most brilliant intellectually in Europe, roused seemingly groundless slander. After undergoing many disappointments she died at Odos in Bigorre, the 21st of September, 1549. Her affection for her

brother was especially beautiful. During his captivity in Spain in 1525, she went to console him and tried in vain to secure less rigorous conditions of release from Charles V. Though a victim of much slander on the part of her enemies, no charges have been brought against her personal character that can be supported by investigation. Her literary work comprises *Le Miroir de l'âme pécheresse* (Alençon, 1531), which was translated into English prose in 1544 by Queen Elizabeth, then eleven years of age. This translation was reproduced in facsimile by Ames (London, 1897). In 1547 some of the religious and dramatic poems of Margaret of Navarre were collected together in a volume entitled *Les Marguerites de la Marguerite des Princesses*, reprinted in 1873 in four volumes. While her poems are usually written in an easy, flowing style, there hovers over them a veil of mysticism which at times obscures the thought. Her *Letters*, of considerable interest from the historical or literary point of view, were published by Génin in 1841-42 (2 vols., Paris). Other poems, consisting of two *comédies*, *Les prisons*, *Le navire*, and a number of shorter pieces, were discovered in the National Library in 1895 and published by Lefranc under the title *Dernières poésies* (Paris, 1896). As a prose writer Margaret is probably deserving of even greater praise than as a poet. Though some have attempted to cast doubt upon the authorship of the *Heptameron* (q.v.), it is very probable that Margaret dictated the work to her secretary Des Périers, or at least the greater part of it. It was originally printed in 1559 at the order of Jeanne d'Albret. Though apparently of no great personal beauty, Margaret's character was marked by a sweetness of disposition combined with intellectual strength as well as a scrupulous morality free from all prudery; and she probably contributed more to the renaissance of learning in France than any other individual at that time, not even excepting Francis himself.

Bibliography. Margaret has been the subject of a considerable number of studies in recent years, due to a certain extent to the large number of her inedited works that are being published. She forms the subject of one of Brantôme's discourses in *Les dames illustres* (vi, 1665-66). Other works worthy of note are Leroux de Linçay, *Essai sur la vie et les ouvrages de Marguerite d'Angoulême* (Paris, 1853); Ferdinand Lotheissen, *Königin Margarete von Navarra* (Berlin, 1885); M. W. Freer, *The Life of Marguerite d'Angoulême* (London, 1895); Rasmussen, *Marguerite of Navarre* (Copenhagen, 1901); Courteault, *Marguerite de Navarre* (Paris, 1904); M. G. Fawcett, *Five Famous French Women* (London, 1905); M. B. Ryley, *Queens of the Renaissance* (Boston, 1907); Cristina Garosci, *Margherita di Navarra* (Turin, 1908); and Madame Darmesteter, *Marguerite d'Angoulême, reine de Navarre* (Paris, 1910). For a critical estimate of her, see Cabantous, *Marguerite d'Alençon et les débuts de la réforme* (Montauban, 1898), and A. J. M. Lefranc, *Grands écrivains de la renaissance* (Paris, 1914). For the most recent discovery of inedited poems by her, see F. Gohin, "Huitains inédits de Marguerite de Navarre et d'un amant platonique," in the *Mélanges Emile Picot*, vol. i (Paris, 1913).

MARGARET, SAINT (c.1045-93). A queen of Scotland. She was the daughter of Edward

the Exile, son of Edmund Ironside, and was born, according to tradition, in Hungary. In 1067 she came to Scotland with her brother Edgar Atheling (q.v.) and soon after became the wife of King Malcolm III. She appears in the chronicles as a woman of almost angelic character and saintly virtues, and numerous instances are recorded of her works of piety and unceasing devotion to the cause of the Church. She exercised a refining influence on the rough manners of the Scottish court by the example of her stainless life, and advanced the welfare of her people by her wide beneficence to the crippled, the orphaned, and the poor. She died Nov. 17, 1093, after receiving news of the death of her husband and her eldest son in a border raid. She was canonized by Pope Innocent IV. Consult: W. F. Skene, *Celtic Scotland*, vol. i (Edinburgh, 1876); Andrew Lang, *History of Scotland from the Roman Occupation*, vol. i (2d ed., New York, 1900); R. S. Rait, *Five Stuart Princesses* (ib., 1908).

MARGARET GRUNT. See MARGATE FISH.

MARGARET OF ANJOU, ʾān'zhōō' (1430-82). Queen Consort of Henry VI of England. She was born on March 23, 1430, and was the daughter of René the Good of Anjou, titular King of Naples and Jerusalem. When in 1439 the peace party in England, headed by Cardinal Beaufort, came into power, they sought to end the Hundred Years' War, and as a step in this direction looked around for a suitable French princess as a wife for the young Henry VI. Their choice fell upon Margaret, and in 1445 the marriage took place. She became, however, rapidly unpopular, the loss of the English possessions in France being charged against her. When in 1453 a son was born to her, Richard, Duke of York, gave up all hope of succeeding peacefully to the crown. Just before the birth of the son Henry had become insane and York had been made Regent; but on the King's recovery in 1455 he led the Yorkists in arms against the house of Lancaster, inaugurating the Wars of the Roses. Margaret became leader of the Lancastrians. In 1460 she was victorious at Wakefield, where the Duke of York fell, but the battle of Towton (q.v.) in 1461 was disastrous to the Lancastrian cause. In 1462 and 1463 Margaret made attempts to restore the fortunes of her house and invaded England without success; and in 1464 her adherents were defeated at Hexham. In 1470 Warwick (q.v.) joined the Lancastrians and restored Henry VI to the throne, but in 1471 Edward IV won a decisive victory at Barnet; Henry was recaptured, and spent the remaining weeks of his life in the Tower. Meanwhile Margaret had landed in England, but was defeated and taken at Tewkesbury in 1471, while her son lost his life on the battlefield. She remained in captivity for about five years, till Louis XI redeemed her for 50,000 crowns. She then retired to France, and died at the château of Dampierre, near Saumur in Anjou, on Aug. 25, 1482.

Bibliography. M. A. Hookham, *Life and Times of Margaret of Anjou, Queen of England and France* (2 vols., London, 1872); Sir J. H. Ramsay, *Lancaster and York*, vol. ii (Oxford, 1892); C. W. C. Oman, *Political History of England*, vol. iv (London, 1906); Schmidt, *Margareta von Anjou (Palaesta)*, vol. liv, Berlin, 1906; Gairdner's introduction to the *Paston Letters*, vol. i (Edinburgh, 1910); Edgcombe Staley, *King René d'Anjou and his Seven Queens* (New

York, 1912). See *ROSES, WARS OF THE; HENRY VI.*

MARGARET OF AUSTRIA (1480-1530). A daughter of Maximilian I of Austria and of Mary of Burgundy. She was born at Brussels and brought up at the French court. Affianced to the Dauphin, afterward Charles VIII, by the Treaty of Arras (1482), she was sent back in 1491 by the King, who married Anne of Brittany. About five years later she married John, Prince of Asturias, heir to the Spanish throne, but he died the next year. In 1501 she became the wife of Philibert II, Duke of Saxony, who died three years later. In 1507 her father made her Regent of the Netherlands. In this office she displayed great ability, carried on the policy of centralization, repressed heresy, but watched also over the material welfare of the country. She participated in the conference at Cambrai in 1508, and negotiated with Louise of Savoy the Peace of Cambrai (1529), called the *Paix des Dames* (Ladies' Peace). Consult Christopher Hare, *High and Puissant Princess Marguerite of Austria* (New York, 1907), and E. E. Tremayne, *The First Governess of the Netherlands: Margaret of Austria* (London, 1908).

MARGARET OF FLANDERS, or OF CONSTANTINOPLE (c.1200-80). Countess of Flanders and Hainault. She was the younger daughter of Baldwin IX, Count of Flanders and Hainault, who died without male issue, the succession passing to her elder sister, Joanna. Margaret, who was usually called "Black Meg," married Bouchard d'Avesnes, bailiff of Hainault, in opposition to the King's wishes, and after a number of years the marriage was annulled, owing to the fact that Bouchard in early life had taken the lower orders of priesthood. In 1223 Margaret married William of Dampierre, and between the children of the two marriages bitter strife ensued for the succession to the lordship over the two counties, which Margaret had obtained in 1244, on the death of her sister. The dispute was referred to the arbitrament of Louis IX of France, who decided that after the death of Margaret Hainault should go to the sons of d'Avesnes, while the children of the second marriage were to receive Flanders. Margaret's reign of 35 years seems to have been one of prosperity for her subjects. Consult Charles Duvivier, *La Querelle des d'Avesnes et des Dampierre* (2 vols., Brussels, 1894).

MARGARET OF PARMA (1522-86). Regent of the Netherlands. She was an illegitimate daughter of the Emperor Charles V and was born and brought up in Brussels. In 1536 she married Alessandro de' Medici, Duke of Florence, who was murdered in 1537; and in 1542 Ottavio Farnese, who became Duke of Parma and Piacenza. She was appointed by Philip II in 1559 to govern the Netherlands with Granvelle (q.v.) as her chief adviser. Though well inclined personally to the people of the Netherlands and their liberties, she yielded readily to the fanatic orders of Philip and the counsels of Granvelle. The attempt to introduce the Inquisition into the country brought about the revolt of 1566, which was the beginning of the long struggle for independence in the Netherlands. In 1567 Alva (q.v.) was sent to crush out all opposition and Margaret resigned her office.

MARGARET OF VALOIS, vā'lwā', or OF FRANCE (1553-1615). A French princess, daughter of Henry II of France and Catharine de'

Medici, and wife of Henry IV. She was born at Saint-Germain-en-Laye, May 14, 1553, and received an excellent education. Her marriage to Henry of Navarre at Paris on Aug. 18, 1572, was intended to be a bond of perpetual reconciliation between Catholics and Huguenots, but was followed after a week by the Massacre of St. Bartholomew. With no love lost on either side, husband and wife, during Henry's forced sojourn at the French court, lived in good-natured toleration of each other's transgressions. After the flight of Henry of Navarre in February, 1576, she was detained for some time as a hostage, but in 1578 rejoined her husband at Pau in Gascony. There she remained for four years and then returned to Paris. Her intrigues at court aroused the resentment of Henry III, who subjected her to repeated humiliations, imprisoned her, and finally instituted a public investigation into her conduct (1583). From 1587 to 1605 she lived at the château of Usson in Auvergne, and there wrote her *Mémoires*. In 1599, after the death of Gabrielle d'Estrées, the favorite of Henry IV, she consented to a divorce from the King, who for a number of years had been desirous of an heir. In 1606 she returned to Paris, where she lived on the best of terms with Henry, attending the coronation of her successor, Maria de' Medici, in 1610. Her *hôtel* in the Rue de Seine was a centre for Paris learning and fashion until her death. With her the house of Valois became extinct. Her *Mémoires*, *Poésies*, and *Letters* were published by Guessard (Paris, 1842). Consult: Leo de Saint-Poncey, *Histoire de Marguerite de Valois* (Paris, 1887); C. Merki, *La reine Margot* (ib., 1905); Albert Savine, *La vraie Reine Margot d'après les documents d'archives et les mémoires* (ib., 1908); H. N. Williams, *Queen Margot, Wife of Henry of Navarre* (London, 1911).

MARGARET TUDOR (1489-1541). The wife of the Scottish King James IV (q.v.). She was born at Westminster, Nov. 29, 1489, the daughter of Henry VII by Elizabeth of York. She was married after considerable negotiation to King James IV of Scotland on Aug. 8, 1503. She played a considerable rôle in the shifting politics of her time, especially after the death of her husband in 1513, but her importance to posterity consists chiefly in the fact that from her James VI of Scotland derived his claims to the English throne, which he ascended as James I of England in 1603.

MARGARIC ACID (from Lat. *margarita*, from Gk. *μαργαρίτης*, *margaritēs*, pearl, from *μαργαρος*, *margaros*, pearl oyster; so called from being deposited as pearly scales during cooling in alcohol in which it has been dissolved), $C_{18}H_{33}COOH$. An artificial solid fatty acid, similar to stearic acid and melting at about 60° C. It has been found in the wax of lichens. An acid having the same molecular composition as margaric acid, but melting at a somewhat lower temperature (55° C.), has been found in the seeds of *Datura stramonium* Linné, and is therefore named *daturic acid*. The name margaric acid was formerly applied to a mixture of palmitic and stearic acids that occurs in certain natural products. The fact that this substance was a mixture, and not a definite chemical compound, was demonstrated by Heintz.

MARGARITA, mār'gā-rē'tā. An island in the Caribbean Sea near the coast of Venezuela, to which country it belongs. Together with other neighboring islands, it forms the State of

Nueva Esparta (Map: Colombia, E 1). It is about 45 miles long and from 5 to 20 miles broad, with an area of 444 square miles. It consists of two mountain ranges, one of them over 4000 feet high, united by a low isthmus. There is a little agriculture and cattle raising, but the principal industries are fisheries and the production of salt. The valuable pearl fisheries of the island are a government monopoly, leased for a term of years to a private company, which is restricted so as to prevent the extinction of the pearl-producing oysters. The population is estimated at 50,000, mostly civilized Indians. The island was discovered by Columbus in 1498. The capital is Asunción (pop., 1933) and the chief port is Pampatar.

MARGARITE (OF. *marguerite*, Fr. *margarite*, *marquerte*, pearl, from Lat. *margarita*, pearl), or **PEARL MICA**. A hydrated calcium-aluminium silicate, closely related to the mica group and crystallizing in the monoclinic system. It is of a light-gray, red, or yellow color and is found associated with corundum, especially in the emery deposits in Asia Minor and the islands of the Grecian archipelago; also in Chester, Mass., Unionville, Pa., and localities in North Carolina.

MARGARITONE D'AREZZO, mār'gà-rè-tò'nà dà-rè'tsò (c.1236-89). A prominent Tuscan painter of the late mediæval epoch, a native of Arezzo. His frescoes in San Clemente at Arezzo have perished, but his Madonna and his Crucifix at San Francesco, his altarpiece at the National Gallery, and his various portraits of St. Francis show crude color, childish drawing, and lack of life; he was a representative of the end of the Italo-Byzantine decline rather than a herald of the Giottesque revival. Portraits of St. Francis were his favorite theme; several remain, both signed and unsigned, in the Vatican, at Siena, Florence, Pisa, Castiglione, and elsewhere. Vasari's contention that he excelled as a sculptor and architect is open to doubt, as the works he attributes to him—the church of San Ciriaco at Ancona and the monument of Gregory X at Arezzo—are not of his age or manner.

MARGATE. A popular watering place and municipal borough in the Isle of Thanet, Kent, England, 74 miles east of London and contiguous to Westgate and Broadstairs (Map: England, H 5). It has important fisheries, but is more noted as a pleasure resort for Londoners, with a theatre, baths, libraries, zoological gardens, esplanade, and excellent hotels. It has many London seaside charitable institutions. The town owns its water supply. Its ancient name was Meregate—the gate to the sea. Its parish church of St. John the Baptist was founded in 1050. Pop., 1901, 23,000; 1911, 27,085.

MARGATE FISH, or **MARGARET GRUNT**. A food fish (*Hæmulon album*), one of the grunts or roncós of the Gulf of Mexico and southward, where it is common in water of moderate depth and reaches a length of 2 feet or more. It is white, with olive-colored back and fins and indistinct spots; the mouth is orange. In some places no one will eat it, but at Pensacola and Key West, and in Nassau and other parts of the British West Indies, it is commonly sold in the markets, frequently under the name "porgy."

MARGAY, mār'gá (Brazilian name). A wild cat (*Felis tigrina*) of the forested parts of tropical America. The animal is so variable in size, color, and markings that several species have been described from its varieties. It seems to

differ little from cats generally in its habits, and occasionally is domesticated.

MARGELAN, mār'ge-lân', or **MARGILAN**, Old and New. Two towns in the Territory of Fergana, Russian Turkestan (Map: Asia, Central, O 2). Old Margelan, about 40 miles east of Khokand, is an Asiatic city, surrounded by a wall and containing mosques and bazars, etc. It has some trade in locally woven camel's-hair cloth and is the centre of a rich agricultural district. Pop., in 1912, 43,586, mostly Sarts, Tajiks, and Jews. New Margelan, situated about 10 miles south of the old town, is the seat of the administration of the territory, and had in 1912 a population of 10,751, mostly Russians.

MARGGRAF, mār'gráf, **ANDREAS SIGISMUND** (1709-82). A German chemist. He was born in Berlin; studied at Berlin, Strassburg, Halle, and Freiberg; and in 1735 became an assistant to his father, a chief apothecary. Elected a member of the Berlin Academy of Sciences in 1738, he was placed in charge of its chemical laboratory after 1754 and of its physics class after 1760. He made valuable observations on phosphoric acid and made improvements in metallurgical processes. His most important contribution, however, was in connection with the discovery of sugar in beet roots, and in 1747 he published an account of his experiments in extracting this sugar. He published also *Chymische Untersuchungen eines sehr merkwürdigen Salzes, welches das Saure des Phosphors in sich enthält* (1757) and *Chymische Schriften* (2 vols., 1761-67).

MARGGRAFF, **HERMANN** (1809-64). A German poet and humorous author. He was born at Züllichau; studied at Berlin; and, devoting himself to journalism, lived and wrote in Leipzig, Munich, Augsburg, and Frankfurt, finally settling in Leipzig (1853) as editor of the *Blätter für literarische Unterhaltung*. He wrote the critical essay, *Deutschlands jüngste Kultur- und Litteraturepoche* (1839); several plays, as, e.g., *Das Tüubchen von Amsterdam*; humorous novels, including *Justus und Chrysotomus, Gebrüder Pech* (1840), *Johannes Mackel* (1841), and *Fritz Beutel* (1855), after the fashion of Münchhausen; a biography of Ernst Schulze (Leipzig, 1855); *Schillers und Körners Freundschaftsbund* (1859); *Gedichte* (1857); *Balladenchronik* (1862).

MARGHERITA, mār'gà-rè'tà (**MARIA MARGHERITA TERESA GIOVANNA DE SAVOIA**) (1851-). Queen Dowager of Italy, the daughter of Ferdinand, Duke of Genoa. She was married in 1868 to her cousin, Humbert, the Prince Royal, who succeeded his father, Victor Emmanuel I, as King of Italy, Jan. 9, 1878, and who was assassinated at Monza on July 29, 1900. Her charm of manner and sweetness of disposition made her extremely popular in Italy.

MARGIN DEALS (OF. *margin*, from Lat. *margo*, boundary). Transactions in which one person, in the character of purchaser, puts up collateral security for the performance of his agreement to purchase securities or other property of fluctuating value. For example, a person employs a broker to purchase stock or other property for him. The buyer not having the money with which to pay the price, the broker advances it, upon receiving from the buyer (his principal) the deposit of a specified sum (margin) and an agreement that he (the broker) may sell the stock in case it depreciates so

that the stock and margin are no longer ample security for his advance. Such a transaction is perfectly valid and enforceable at common law. By constitutional or statutory provisions in some of the United States, however, even margin deals of this sort have been put under the ban and are void as tending to encourage speculative dealing in shares of corporations or in the necessities of life, and thus to enhance their price to the non-speculative buyer. In such jurisdictions the buyer may repudiate the agreement and recover from the broker any moneys put into his hands as a margin.

The term is more frequently applied to contracts entered into, and deposits made, to disguise gambling transactions in stocks or in property sold for future delivery. Deals of this sort are illegal and void at common law. Not only is the contract itself unenforceable, but negotiable paper or other securities given as a part of the transactions are void, and property deposited as a margin may be recovered. Margin deals of this kind, being in reality gambling transactions, are punishable in some of the States as criminal offenses. Consult F. R. Mechem, *The Law of Agency* (Chicago, 1889), and J. R. Dos Passos, *Treatise on the Law of Stock Brokers and Stock Exchanges* (2d ed., 2 vols., New York, 1905).

MARGITES, mār-jī'tēz. A mock-heroic epic, ascribed to Homer by Aristotle and by him considered to be the germ of comedy. It has also been attributed to Pogos of Halicarnassus, the brother of Queen Artemisia. It describes the various predicaments in which Margites, a foolish young fellow, was placed.

MARGOLIOUTH, mār-gō'li-ōt, DAVID SAMUEL (1858-). An English Arabic scholar, born in London. He studied at Winchester and at New College, Oxford, became fellow of New College (1881), and in 1889 was appointed Laudian professor of Arabic at Oxford. He also held the post of assistant keeper of Oriental books and manuscripts in the British Museum. In 1912 he represented the British government at the Oriental Congress at Athens. He wrote: *Analecta Orientalia ad Poeticam Aristotelem* (1888); *Jepheth Ben Eli, Commentary on the Book of Daniel* (1889); *Arabic Papyri of the Bodleian Library* (1893); *Chrestomathia Baidawiana* (1894); *Letters of Abul 'Ala* (1898); *Lines of Defense of the Biblical Revelation* (1900; 3d ed., 1903); *Mohammed and the Rise of Islam* (1905); *Cairo, Jerusalem and Damascus* (1907); *Mohammedanism* (1911); *The Early Development of Mohammedanism*, Hibbert lectures (1914); and he edited Yakut's *Dictionary of Learned Men* (1907-13) and Aristotle's *Poetics* (1911).

MARGOLIS, MAX LEOPOLD (1866-). An American Hebrew philologist, born at Merech, Vilna, Russia, and educated at the Leibnitz Gymnasium, Berlin, and at Columbia University, New York (A.M., 1890; Ph.D., 1891). He was lecturer on Jewish literature at the Glenmore School for Cultural Sciences at Keene, N. Y., in 1892, assistant professor of Hebrew and biblical exegesis in 1892-97 and professor of biblical exegesis in 1905-07 at the Hebrew Union College, Cincinnati, Ohio, and assistant professor of Semitic languages and literatures (1897-98) and associate professor (1898-1905) at the University of California. After visiting Europe in 1907-08, he served for a year as editor in chief of Bible translation

for the Jewish Publication Society of America, and in 1909 he became professor of biblical philology at Dropsie College for Hebrew and Cognate Learning, Philadelphia. He published: *The Columbia College Manuscript of Meghilla* (1892); *An Elementary Text-Book of Hebrew Accidence* (1893); *The Theological Aspect of Reformed Judaism* (1904); *A Manual of the Aramaic Language of the Babylonian Talmud* (1910).

MAR/GRAVE (Ger. *Markgraf*, border count). In early mediæval times the military chieftains or guardians to whom was intrusted the defense of the border, with the government over such frontier provinces, known as marks or marches. In continental Europe these margraves at first held their offices only during life, but, as they became more independent and powerful, their positions and titles became vested in the same line, and they were established as a powerful hereditary order of nobility. In England the lords or wardens of the marches were appointed to guard the frontiers of Wales and Scotland, and the office was long regarded as special or temporary; the term "marquis" was not applied to the office until 1395. See GRAF; MARK; MARQUIS.

MARGRY, mār'grê', PIERRE (1818-94). A French historian, born at Paris. He became as a young man adjunct curator of the archives of the department of the Minister of Marine, and in 1842 was intrusted with the task of studying the colonial history of France in America. Among his works are: *La navigation du Mississippi et les précurseurs de Fulton aux Etats-Unis* (1859); *Les Normands dans les vallées de l'Ohio et du Mississippi* (1860); *Les navigateurs français et la révolution maritime du XIVème au XVIème siècle* (1867); *Relations et mémoires pour servir à l'histoire de la France dans les pays d'outre mer* (1867); *Les seigneurs de la Martinique* (1879); *Découvertes et établissements des Français dans l'Amérique septentrionale* (1879-88); *Le conquérant des îles Canaries* (1880). He edited *Les souvenirs d'un homme de lettres*, based on Augustin Jal's manuscripts (1877).

MARGUERITE, mār'ge-rêt'. A garden plant. See CHRYSANTHEMUM.

MARGUERITE, or **MARGARET**. The principal female character in Goethe's *Faust*.

MARGUERITE DE VALOIS. See MARGARET OF VALOIS.

MARGUERITTE, mār'g'rêt', PAUL (1860-) and VICTOR (1866-). French novelists, brothers, sons of a general who fell at Sedan. Both were born in Algeria. Paul made his début as a naturalist writer, but turned more and more towards introspection and problems of morality. Alone he wrote: *Tous quatre* (1885); *La confession posthume* (1886); *Maison ouverte* (1887); *Pascal Gefosse* (1887; 2d ed., 1912); *Jours d'épreuve* (1889); *Amants* (1890; 2d ed., 1908); *Ma grande* (1892; 2d ed., 1911); *La tourmente* (1894); *L'Essor* (1896; 2d ed., 1910); *A la mer* (1906); *La flamme* (1909); *La faiblesse humaine* (1910); *La maison brûle* (1913). Victor, who had been an officer of cavalry, had published some verse and the novels *Le carnaval de Nice* (1897) and *Poum* (1897) before he joined his brother in one of the most notable collaborations in literary history. Alone he wrote in later years: *Prostituée* (1907); *Jeunes filles* (1909); *L'Or* (1910); *Pour mieux vivre* (1910); *L'Imprévu* (1910), a comedy;

Les frontières du cœur (1912); *Le journal d'un mollet* (1912); *La rose des ruines* (1913). Together the brothers produced a series of romances dealing with the Franco-German War, including *Le désastre* (1898), *Les tronçons du glaive* (1900), *Les braves gens* (1901), and *La commune* (1904). Their views on the social position of women are embodied in *Femmes nouvelles* (1899), *Les deux vies* (1902), and *Le prisme* (1905), the second of which was dramatized with great success as *Le cœur et la loi* (1905). They published a popular history of the war with Germany (1903); a volume of miscellaneous essays, *Quelques idées* (1905); *Sur le vif* (1906); *Vanité* (1907); *L'Autre*, a drama (1908); *Alphonse Daudet* (1908); *L'Eau souterraine* (1908; 2d ed., 1910); *Nos tréteaux* (1911). Paul Margueritte was one of the original members of the Académie Goncourt. Consult Pilon, *Paul et Victor Margueritte* (Paris, 1905).

MARHEINEKE, mār-hi'ne-ke, PHILIPP KONRAD (1780-1846). A German theologian. He was born at Hildesheim, May 1, 1780; educated at Göttingen; became repetent there, 1804; professor extraordinary of theology at Heidelberg, 1805; professor ordinary there, 1809; and in 1811 was called to the same position at Berlin and chosen pastor of the church of the Trinity, where he became a colleague of Schleiermacher. His studies lay principally in the direction of Christian symbolism and dogmatics. To the former he devoted his *Christliche Symbolik* (1810-14) and his *Institutiones Symbolicæ* (1812); to the latter, his *Grundlehren der christlichen Dogmatik* (1st ed., 1819; 2d ed., 1827). The second edition of this work is strongly Hegelian, and all his later work was done under Hegelian influence. The positive form of his theology may be found in his *Entwurf der praktischen Theologie* (1837). He wrote many books besides those named, including the important *Geschichte der deutschen Reformation* (1816) and *Die Reformation, ihre Entstehung und Verbreitung in Deutschland, dem deutschen Volke erzählt* (1846). He died in Berlin, May 31, 1846. His *Theologische Vorlesungen* appeared posthumously (1847-49), with biographical sketch. Consult Weber, *Le système dogmatique de Marheineke* (Strassburg, 1857), and Otto Pfeiderer, *Development of Theology in Germany* (3d ed., New York, 1909).

MARÍA CHRISTINA, mã-rě'ã kris-tě'nã (1806-78). Queen of Spain. She was a daughter of Francis I, King of the Two Sicilies, and was born in Naples, April 27, 1806. In 1829 she became the fourth wife of Ferdinand VII of Spain. In 1830 Ferdinand restored the law by which, in default of male issue, the right of inheritance was given to females. In October of that year the Queen gave birth to a daughter, Isabella. The Spanish Liberals gladly embraced the cause of the Queen, rejoicing to see Ferdinand's brother, the reactionary Don Carlos (q.v.), further removed from the succession to the throne. Ferdinand died Sept. 29, 1833, and by his testament his widow was appointed guardian of her children—the young Queen Isabella and the Infanta Louisa (born 1832)—and Regent until the Queen should attain the age of 18. A civil war at once broke out in Aragon and the Basque Provinces between the opposing parties known as Carlists and Cristinos, but the Queen mother seemed indifferent to everything except the company of Don Fer-

nandez Muñoz (1808-73), one of the royal body-guard, whom she made her chamberlain, and with whom she was united in December, 1833, in a morganatic marriage. Her practice as Regent was to adopt the course agreeable to the Minister of the day, and thus her government was despotic under one ministry and liberal under another. She contrived, however, upon many occasions to embrace the proceedings of her more liberal or constitutional ministers; but when she sanctioned by her signature the law which deprived the communes of the right to elect their councils, a popular commotion ensued and she was compelled to resign the regency, being succeeded by the Prime Minister, Espartero. She retired to France, but continued to interfere in the affairs of Spain. After the fall of Espartero she returned to Madrid (1843) and in October, 1844, her marriage with Muñoz, who was now made Duke of Rianzares, was publicly solemnized. Her participation in the schemes of Louis Philippe in the matter of the marriage of her daughters, in 1846, and the continued exercise of all her influence in a manner unfavorable to constitutional liberty, made her the object of great dislike to the whole Liberal party in Spain. At length, in July, 1854, a revolution expelled her from the country, and she again took refuge in France. She returned to Spain in 1864, only to retire again in 1868. She died at Havre, Aug. 22, 1878. Consult Hélène Vacaresco, *Kings and Queens I have Known* (New York, 1904), and E. B. d'Auvergne, *A Queen at Bay: The Story of Cristina and Don Carlos* (ib., 1910). See SPAIN.

MARÍA CHRISTINA (1858-). A Queen of Spain. She was the daughter of Archduke Karl Ferdinand of Austria, and in 1879 married Alfonso XII of Spain, to whom she bore a posthumous son in 1886, Alfonso XIII. She acted as Regent until Alfonso XIII was declared of age, May 17, 1902, carrying on the government with much ability and tact, and so training the young King that he was often spoken of as "the best-brought-up" boy in Europe.

MARIA DE' MEDICI, mã-rě'ã dã mã'dě-chě, MARIE DE' MEDICI in English and MARIE DE MÉDICIS in French (1573-1642). The second wife of Henry IV of France. She was the daughter of Francis I, Grand Duke of Tuscany, and was born at Florence, April 26, 1573. She was married to Henry IV in 1600, and in 1601 gave birth to a son, afterward Louis XIII. Maria, though beautiful, was an obstinate, ambitious, passionate, and stupid woman. Her quarrels with Henry over her favorites and the King's gallantries became the talk of Paris. Two Italians, Leonora Galigai and her husband, Concini (see ANCRE), exercised a powerful influence over her mind and encouraged her dislike to her husband, who on his part avoided her as much as possible. She was not publicly crowned as Queen until the day before Henry's assassination (May, 1610). For the next seven years she governed as Regent, but proved incapable as a ruler. After the murder of Concini, in 1617, Louis XIII assumed royal power, aided by his favorite, the Duke de Luynes, who had put Concini out of the way. Maria was kept under surveillance in the castle at Blois. She escaped in 1619, and began a war against the King and court, being allied with certain of the disappointed nobles. The conflict was brief, and ended in the complete overthrow of Maria. In 1621 the death of Luynes led to her return to court. Maria hoped to win over Richelieu to her

party, and he was created Cardinal and Minister of State, partly through her influence. She soon found out, however, that he did not care to be ruled by her, whereupon she resolved to undermine his influence with the King. Her intrigues for this purpose in 1630 failed, and she was imprisoned in Compiègne, from whence she escaped to Brussels in 1631. She finally found her way to England to the court of her son-in-law, Charles I, but was compelled to leave London in 1641. She died at Cologne on July 3, 1642. Maria de' Medici was a lover and patron of the fine arts, and Paris owes to her the Luxembourg Palace and other public works.

Bibliography. B. Zeller, *La minorité de Louis XIII: Marie de Médicis et Sully, 1610-1612* (Paris, 1892); id., *La minorité de Louis XIII: Marie de Médicis et Villeroy* (ib., 1897); Julia Pardoe, *Life of Marie de Médicis, Queen of France* (3 vols., New York, 1902); A. P. Lord, *The Regency of Marie de Médicis* (ib., 1903); Louis Batiffol, *Marie de Médicis and the French Court in the Seventeenth Century*, translated by Mary King (ib., 1908); F. A. d'Estrées, "Mémoires du maréchal d'Estrées sur la régence de Marie de Médicis, 1610-1616, et sur celle d'Anne d'Autriche, 1643-1650," in *Société de l'histoire de Paris, publication*, vol. ccxcix (Paris, 1910). See HENRY IV; FRANCE.

MARIAGE DE FIGARO, mǎ-rě-āzh' de fě-gǎ-ró', LE, OU LA FOLLE JOURNÉE. A comedy by Beaumarchais, produced at the Comédie Française in 1784. It forms the continuation of *Le barbier de Séville*.

MARIAGE FORCÉ, mǎ-rě-āzh' fôr-sǎ', LE (Fr., the forced marriage). A one-act prose comedy ballet by Molière (1664). The piece bore the name "ballet du roi," because Louis XIV danced in it as a gypsy.

MARIA GENS. A plebeian gens at Rome. It was never divided into families. Its most celebrated member was Gaius Marius (q.v.), conqueror of the Cimbri and the Teutones.

MARIAGER, mǎ-rě-ā'gěr, PETER (1827-94). A Danish novelist, born at Nyborg. He became known through translations from the French and German, such as that of Flammarion's *Inhabited Worlds*. His original works are: *Fra Hellas, Fem antike Fortællinger* (1881); *Den sidste Lamia, og andre antike Fortællinger* (1884); *Magthaveren paa Rhodos* (1886); *Sybaris* (1887), a drama; *Dronningen af Kyrene, og andre antike Fortællinger* (1890); *Et Bryllup i Katakomberne* (1893); *Sparta* (1895). All his stories relate to Greek and Roman subjects, and some were translated into English, German, Swedish, Dutch, and Greek.

MARIA II DA GLORIA, mǎ-rě-ā dǎ glō-rě-ā (1819-53). A Queen of Portugal. She was a daughter of Dom Pedro I, Emperor of Brazil, and a granddaughter of King John VI of Portugal. She succeeded to the Portuguese throne in 1826 on the death of her grandfather (her father Dom Pedro renouncing his claim to the throne in her favor), and, though only a child, was promised in marriage to her uncle, Dom Miguel, who was to act as Regent. The latter, however, in 1828 usurped the throne. In 1832-33 Dom Pedro successfully attacked Dom Miguel by land and sea, and in 1834 the usurper, yielding to the threats of England and France, submitted. Maria was established on the throne, and in 1835 she married the Duke Charles Augustus of Leuchtenberg, who died a few

months later. The next year she married Duke Ferdinand of Saxe-Coburg-Gotha-Kohary. She was succeeded by her eldest son, Pedro V.

MARIA LESZCZYŃSKA, lěsh-chin'skǎ (1703-68). Wife of King Louis XV of France. She was the daughter of Stanislas Leszczynski, King of Poland, and was born in Breslau before he came to the throne. Maria accompanied her father in his wretched wanderings after his expulsion from Poland. He settled in Alsace in 1719, and there the Duke of Bourbon saw Maria and arranged her marriage with Louis XV, who was seven years her junior. She lived in retirement, devoting herself to acts of piety and charity, and died at Versailles. Consult: D'Armaillé, *La reine Marie Leszczynska* (2d ed., Paris, 1870); De Nolhac, *La reine Maria Leszczynska* (ib., 1900); id., *Louis XV et M. Leszczynska* (ib., 1902).

MARIA LOUISA (1791-1847). The second wife of the Emperor Napoleon I. She was born Dec. 12, 1791, the daughter of the Archduke Francis, afterward the Emperor Francis I of Austria, and was married to Napoleon on April 2, 1810. The marriage seemed to give stability to the Bonaparte dynasty, and in some measure to afford a prospect of peace to Europe. On March 20, 1811, she bore a son, who was called King of Rome. On the abdication of Napoleon she was not permitted to follow her husband, but went with her son to Schönbrunn, where she remained during the Hundred Days and until 1816, when she received the duchies of Parma, Piacenza, and Guastalla. In 1822 she contracted a morganatic marriage with her chamberlain, Count von Neipperg, who had been her lover before and by whom in 1821 she had a son, the Duke of Montenuovo. Count von Neipperg died in 1829. In 1833 she entered into a secret marriage with Count Bombelles, likewise her chamberlain. She died at Vienna, Dec. 17, 1847.

Bibliography. A. L. Imbert de Saint-Amand, *The Happy Days of the Empress Marie Louise* (New York, 1890-91); id., *Marie Louise and the Invasion of 1814* (ib., 1892); id., *Marie Louise et le Duc de Reichstadt* (Paris, 1892); id., *Marie Louise, the Island of Elba, and the Hundred Days* (New York, 1894); id., *Marie Louise and the Decadence of the Empire* (ib., 1902); H. MARIA LOUISA, ORDER OF. A Spanish order founded by Charles IV, in 1792, and bestowed by the Queen on women of the old nobility. The recipient is expected to devote herself to charitable and pious works. The order has one class.

MARÍA LUISA, mǎ-rě-ā lōō-ě'sǎ (1751-1819). Daughter of Duke Philip of Parma and wife of King Charles IV of Spain (q.v.), whom she married in 1765 while he was still Prince of Asturias. When he succeeded to the crown in 1788 she and her lover, Godoy, Duke of Alcudia, managed to secure practical control of the government. After the revolution in 1808, which placed Ferdinand VII on the throne of his father, she and her husband fled to France and appealed to Napoleon, who induced the young King to restore the crown to his father and then persuaded the latter to cede it to him; whereupon he promptly bestowed it on his brother Joseph (q.v.). María spent the remainder of her life in exile at Marseilles and Nice and latterly at Rome, where she died.

MARÍA LUISA (1782-1824). Queen of Etruria, daughter of Charles IV of Spain (q.v.) and María Luisa of Parma (q.v.). She married Louis, eldest son of Duke Ferdinand of Parma, in 1795. In 1801 her husband was invested by Napoleon with the Kingdom of Etruria (Tuscany), the consideration being that Parma should revert to France on the death of Ferdinand. When Louis died in 1803, her son, Charles Louis, succeeded to the Etrurian throne under her regency, but the Kingdom was incorporated in 1807 in the French dominions. She then retired to Spain, but after her father's abdication lived in Parma and later in Nice. An attempt to flee to England was frustrated in 1811, and she was forced to seek refuge in a cloister in Rome, where she remained until 1814. The Congress of Vienna in compensation gave to the young Prince the city of Lucca, which his mother governed as Regent until he came of age, and in a subsequent treaty it was stipulated that Parma should revert to him on the death of the ex-Empress Maria Luisa. She was beatified by the Pope in 1876. The Queen's memoirs were published by d'Argy, entitled *Mémoires de la reine d'Etrurie* (Paris, 1814).

MARIAMNE, mā'ri-ām'nē. Wife of Herod the Great (q.v.). She belonged to the family of the Hasmonæans or Maccabees (q.v.), being the granddaughter of Hyrcanus II. Although she was deeply beloved by her husband, he had her put to death in a fit of jealousy, and remorse for the act embittered the later years of his life. She is famed for her beauty as well as her tragic fate.

MARIAMNE. The title of plays by Alexandre Hardy (1610), Tristan l'Érmitte (1637), and Voltaire (1723), based on the story of Mariamne, wife of Herod the Great.

MARIANA, mā'rē-ā'nā. A tribe of South American Indians. See MARANHA.

MARIANA, mā'ri-ā'nā. In Shakespeare's *Measure for Measure*, the charming and womanly lover of Angelo. Tennyson's *Mariana in the Moated Grange* and *Mariana in the South* were based on her character.

MARIANA. The name given by Capt. John Mason to the land granted him by the Council for New England on March 9, 1621-2. The patent, which was the second granted by the Council, covered the lands lying between the Naumkeag (Salem) and Merrimac rivers, with the islands within 3 miles of the shore, and was included in the present territory of Massachusetts.

MARIANA, mā'rē-ā'nā, JUAN (1536-1623 or 1624). A distinguished Spanish historian and scholar, born at Talavera. In 1553 he entered the Order of the Jesuits. His early studies in languages and theology were so brilliant that he was appointed to teach in the schools of his order, first at Rome (where the celebrated Belarmine [q.v.] was one of his scholars) in 1561, afterward in Sicily in 1565, and finally in Paris in 1569. After a residence there of seven years he settled at Toledo, where he resided till his death, at an extreme old age. His retirement, however, was passed in sustained literary activity. From an early period he devoted himself to writing a history of Spain (1592-1605). The original of this history was Latin, the elegance and purity of which have secured for Mariana a place among the most distinguished of modern Latinists. Mariana himself published a Spanish translation, which still remains one of the classics of the language. Among his other produc-

tions are his scholia of the Bible and an edition of the works of Isidore of Seville. But the most celebrated of the works of Mariana is his well-known treatise, *De Rege et Regis Institutione* (1599), in which is raised the important question whether it is lawful to overthrow and kill a tyrant. Mariana decides that it is right for every man to do so, even where the tyrant is not a usurper, but a lawful king, and esteems Jacques Clément (q.v.) equally with Brutus. Mariana's views on other subjects were broad-minded and liberal. In 1609 he published a volume *Tractatus VII Theologici et Historici*, which was placed upon the Index Expurgatorius and caused his arrest by the Inquisition. His *Discursus de Erroribus qui in Forma Gubernationis Societatis Jesu Occurrent* (Bordeaux, 1625) was reprinted by Charles III as a defense of his order banishing the Jesuits from Spain in 1767. Consult: Juan Mariana, *Historia general de España: ilustrada en esta nueva impresión de tablas cronológicas, notas, y observaciones críticas: con la vida del autor* (9 vols., Valencia, 1783-96); Leopold von Ranke, *Zur Kritik neuerer Geschichtsschreiber* (Leipzig, 1874); Georges Cirot, *Mariana, historien* (Paris, 1905).

MARIANA ISLANDS. See LADRONE ISLANDS.

MARIANI, mā'rē-ā'nē, ANGELO (1822-73). A famous Italian orchestral conductor, born at Ravenna. He received his entire musical education at the Liceo Filarmónico in Bologna, where he was a pupil of Rossini. In 1844 he began his career as conductor in Messina, whence he went to Milan. Here he found ample opportunity to display his remarkable gifts, so that in 1847 he was called to Copenhagen as court conductor. At the outbreak of the revolution of 1848, however, he hastened back to his native country and joined the colors. In 1852 he became conductor at the Teatro Carlo Felice in Genoa. Before long he had won the reputation of being the greatest conductor in all Italy. About 1860 he was called to the municipal theatre of Bologna, where he began a propaganda for Wagner, at a time when in Italy Lohengrin was regarded as a monstrosity. In 1873 he returned to Genoa, where he died a few weeks after his arrival. He composed a *Requiem* and several cantatas.

MARIANISTS. See MARISTS.

MARIANNA. A city and the county seat of Lee Co., Ark., 43 miles southwest of Memphis, Tenn., on L'Anguille River, at the head of navigation, and on the St. Louis, Iron Mountain, and Southern Railroad (Map: Arkansas, E 3). It carries on a considerable trade in cotton, and has cotton gins, cottonseed-oil mills, lumber mills, and manufactories of headings, box shooks, and spokes. The city contains an Elks' Home, courthouse, public park, and fine city hall building. The water works are owned and operated by the municipality. Pop., 1900, 1707; 1910, 4810.

MARIANNE, mā'rē-ān', OU LES AVENTURES DE LA COMTESSE DE. . . An unfinished romance by Marivaux (1731-41), to which a second part was added in 1755 by Madame Riccobini. The novel has been said to be the origin of *Pamela*. It is important as the first novel of analysis rather than of incident, and contains minute pictures of bourgeois and conventual life.

MARIANNE (mā'ri-ān') ISLANDS. See LADRONE ISLANDS.

MARIA'NUS SCOT'US (1028-c.1082). An Irish chronicler, whose real name was Moelbrigte. He took the vows of a monk at the age of 24 and, leaving Ireland, entered the monastery in Cologne in 1056. There he remained for two years. He became a recluse in Fulda in 1059, and continued as such all the rest of his life, which, after 1069, was spent at Mainz. His claim to remembrance rests upon a *Chronicon Universale*, extending from the birth of Christ to 1082, which contains extracts from Bede and other chroniclers, besides new material. The first printed edition was made at Basel in 1559, and five have appeared since then, including one published with translation at Dublin in 1892.

MARIANUS SCOTUS (died probably 1088), the contemporary and namesake of the above, was first abbot of the monastery of St. Peter, Ratisbon, of which he was one of the founders. He was born in Ireland. His calligraphy made him famous, and he is known as a saint.

MARIA (mā-rí'ā) **OF AUSTRIA** (1505-58). A Queen of Hungary, a daughter of Philip the Fair of Burgundy and Joan of Castile, and sister of the emperors Charles V and Ferdinand I of Hapsburg. Born at Brussels in 1505, she married Louis II of Hungary at 17 and was widowed at 21, her husband being killed by the Turks at Mohács. In 1530 she was appointed Governor-General of the Netherlands by Charles V, succeeding Margaret of Austria. There she ruled ably and firmly for 24 years. In general, she aided Charles in his foreign policy, often acted as mediator between him and Ferdinand, and resigned from her office in the Netherlands upon the abdication of Charles (1555). She retired to Spain, and died at Cigales. Maria was a patron of arts and letters, and left a valuable collection of manuscripts now in the Burgundian Library of Brussels. Consult T. Juste, *Les Pays-Bas sous Charles V; Vie de Marie de Hongrie* (Brussels, 1861).

MARIA PIA, mǎ-ré'ā pē'ā (1847-1911). A Queen of Portugal, daughter of Victor Emmanuel II of Italy, born at Turin. In 1862 she married Luiz I of Portugal. Upon the accession to the throne of her son Carlos I (Oct. 9, 1889), she became the dowager Queen. On Feb. 1, 1908, King Carlos and Prince Luiz, the heir apparent, were assassinated in the streets of Lisbon and Maria Pia's grandson Dom Manuel ascended to the throne. Of a very kindly disposition, she lived in close retirement after the accession of Manuel and devoted herself to charitable and philanthropic work. When Manuel was overthrown, in 1910, she went to live with her sister, Princess Clotilda, near Turin, Italy.

MARIA STUART, mǎ-ré'ā stōō'art. A tragedy by Schiller, printed and presented in 1800.

MARIA THERESA, mǎ-rí'ā te-rē'sā (1717-80). Queen of Hungary and Bohemia, Archduchess of Austria, and wife of the German Emperor Francis I. She was the daughter of the Emperor Charles VI (q.v.) and was born at Vienna, May 13, 1717. By the Pragmatic Sanction (q.v.) her father sought to secure from the European Powers her undisputed succession to the Hapsburg dominions in the absence of a male heir. On Feb. 12, 1736, she married Francis Stephen, Duke of Lorraine (soon after Grand Duke of Tuscany), and on the death of her father, Oct. 20, 1740, she succeeded to the hereditary possessions of the house of Austria,

which, in addition to the German, Hungarian, and Slavic lands, included Lombardy and the Belgian Netherlands. She found the monarchy exhausted, the finances embarrassed, the people discontented, and the army weak; while Prussia, Bavaria, Saxony, Naples, and Sardinia, stirred up by France, put forward claims to portions of her dominions, chiefly founded on the extinction of the male line of the house of Hapsburg and in contravention of the Pragmatic Sanction. The War of the Austrian Succession (1740-48) ensued, in which England supported Austria. (See SUCCESSION WARS.) Frederick II of Prussia soon made himself master of Silesia; Spain and Naples laid hands on the Austrian dominions in Italy; and the French, Bavarians, and Saxons overran the hereditary Austrian territories. The young Queen was in the utmost danger of seeing her realms dismembered, but was saved by the chivalrous fidelity of the Hungarians, the assistance of England, and most of all by her own resolute spirit. Her enemies quarreled among themselves, and the War of the Austrian Succession was terminated by the Peace of Aix-la-Chapelle in 1748. Maria Theresa lost Silesia and Glatz and the duchies of Parma, Piacenza, and Guastalla. In 1745 her husband (Francis I) had been raised to the Imperial throne of Germany on the death of Charles VII. During the period of peace that followed she initiated great financial reforms. Agriculture, manufactures, and commerce flourished, the national revenues greatly increased, and the burdens of the peasantry were diminished. All this time she was strengthening her resources in anticipation of a renewal of the war with Frederick the Great. Her indomitable pride and her devout Catholicism would not permit her to relinquish Silesia as long as she could fight for it. She found in Kaunitz (q.v.) a minister possessed of the wisdom and energy requisite for the conduct of affairs, and in him she placed almost unlimited confidence. He effected the alliance with France which disturbed all existing international arrangements (1756). In the Seven Years' War (q.v.) which followed Maria Theresa and her allies well-nigh achieved the ruin of Frederick the Great, but the generalship of the indomitable Prussian King, the incapacity of the generals of Louis XV, and Russia's abandonment of the cause of Maria Theresa enabled Frederick to emerge from the struggle with his dominions intact. The war reduced Austria to a state of great exhaustion, but when it was concluded Maria Theresa renewed her efforts to promote the national prosperity, and made many important reforms, ameliorating the condition of the peasantry and mitigating the penal code. Her son, Joseph II, became Holy Roman Emperor on the death of her husband in 1765. Maria Theresa associated him with herself in the government of her hereditary states, but in reality committed to him the charge only of military affairs. She joined with Russia and Prussia in the first partition of Poland (1772), Galicia falling to her share. She also compelled the Porte to give up Bukowina to her (1777). The brief War of the Bavarian Succession (1778-79) ended in her acquisition of a district along the Inn (Innviertel), but led to the formation of the Fürstenbund, or League of German Princes, which set bounds to the Austrian power in Germany. Maria Theresa died in Vienna, Nov. 29, 1780. Throughout her reign she displayed a resolute and masculine charac-

ter. Although a zealous Roman Catholic, she maintained the rights of the crown against the papal power and endeavored to correct some of the worst abuses in the church. She prohibited the presence of priests at the making of wills, abolished the right of asylum in churches and convents, and suppressed the Inquisition in Milan. Her son succeeded her as Joseph II (q.v.).

Bright, *Maria Theresa* (London, 1897); Hans von Zwiédineck-Südenhorst, *Maria Theresa* (Bielefeld, 1905); M. M. Moffatt, *Maria Theresa* (New York, 1911), containing an exhaustive bibliography. Her correspondence has been edited by Kervyn de Lettenhove, *Lettres inédites de Marie Thérèse et de Joseph II*, Royal Academy of Belgium, and by Alfred von Arneth (Vienna, 1867-81).

MARIA THERESA, ORDER OF. An Austrian order conferred exclusively for distinguished conduct in war, founded in 1757. The monarch is the head of the order. Pensions ranging from 600 to 6000 florins are given to members. The distinction is very sparingly conferred.

MARIA-THERESIOPEL. See THERESIOPEL.

MARIAZELL, mǎ'rê-â-tsêl'. A village in the Crownland of Styria, Austria, 2810 feet above the sea, 58 miles southwest of Vienna (Map: Austria, D 3). It is the greatest pilgrim resort of Austria-Hungary, being visited annually by about 150,000 people. The church containing a famous carved wood image of the Virgin was originally founded in 1363 and rebuilt in 1827. It contains a valuable Madonna by an unknown Italian master and a silver altar. In the vicinity there are large iron-foundry and paper-pulp works. Pop., 1900, 1499.

MARIBOJOC, mǎ'rê-bô-hôk'. A town of Bohol, Philippines, situated on high ground on the southwest coast, 8 miles north of Tagbilaran. It is an important road centre. Pop., 1903, 11,830.

MARICOPA, mǎ'rê-kô'pá, or COCO-MARICOPA. A tribe of Yuman stock (q.v.), formerly living about the junction of the Gila and Colorado rivers, southwestern Arizona. About 70 years ago, on account of the hostility of the Yuma, they moved up the Gila and confederated with the Pima (q.v.), with whom they are now living upon the Gila River reservation. They depend upon agriculture by irrigation and formerly raised large crops. They live in houses of corn-stalks and straw woven upon a framework of poles, with storehouses and arbors surrounding. Their women are superior potters, basket makers, and weavers of native cotton. The men formerly wore only the G-string, while the women wound a strip of cotton cloth about the waist. The hair was worn flowing and cut across the forehead. At present they are practically civilized through missionary effort and have a high reputation for industry and general good qualities. They number about 386. A sample of their work is shown on the Plate of INDIAN

BASKETS. See YUMAN STOCK. Consult Frank Russell, "Pima Indians," in *United States Bureau of American Ethnology, Twenty-Sixth Annual Report* (Washington, 1908).

MARICOURT, mǎ'rê'kôor', SIEUR DE. See LE MOYNE, PAUL.

MARIE (ADÉLAÏDE THÉRÈSE HILDA ANTOINETTE WILHELMINE), mǎ'rê' â'dá'lá'ed' tá'rêz' êl'dá' ân'twá'nê't' vèl'el'mên' (1894-), GRAND DUCHESS OF LUXEMBURG. She was the daughter of William Alexis (1852-1912), whose father, Adolphus of Nassau, became Grand Duke of Luxemburg in 1890 under the rule incorrectly termed the Salic Law (q.v.) upon the death of William III of Holland and the failure of the direct male line. In 1907, when her father had been Grand Duke for two years, as he had no direct male heir, the succession was made hers. Her father died on Feb. 25, 1912, and she succeeded on June 18 of that year. Her mother was Maria Anna (born 1861), daughter of Dom Miguel (1802-66) of Portugal. The young Grand Duchess bitterly objected to the breach of the neutrality of Luxemburg by Germany in 1914 and was even said to have attempted in person to stop the entry of German troops.

MARIE AMÉLIE DE BOURBON, mǎ'rê' â'má'lê' de bôor'bôn'. Queen of the French. See AMALIE, MARIE.

MARIE ANTOINETTE, ân'twá'nê't' (1755-93). Queen of France and consort of Louis XVI. She was the youngest daughter of Emperor Francis I and Maria Theresa and was born at Vienna, Nov. 2, 1755. At the age of 14 she was betrothed to the French Dauphin and in the following year was married at Versailles. Her reception by her husband and the King, Louis XV, was flattering, but her naïveté, unceremonious pleasantry, and detestation of rigid etiquette scandalized Versailles. Soon after the accession of Louis XVI (1774), her enemies, of whom the chief was the Count of Provence, younger brother of the King, who subsequently ruled as Louis XVIII, circulated libels accusing her of constant intrigues. Her love of luxury and extravagance and her indifference to the miseries of the people, combined with her attempts to use her influence with Louis XVI to shape the foreign policy of France in accordance with the interests of Austria, made her unpopular with the people and gained her the epithet of "the Austrian woman" (*l'Autrichienne*). The affair of the Diamond Necklace (q.v.), in 1785, hopelessly compromised her good name in the eyes of the public. Her influence on the internal politics of the country was not more fortunate. Loménie de Brienne and Calonne were ministers of her choice, and she shared the opprobrium called down upon them for their reckless squandering of the national finances. She strongly opposed the summoning of the Notables (1787) and of the States-General (1789); and she had good reason to dread their convocation, for one of the very first things the Notables did was to declare the Queen the cause of the derangement of the finances. From the first hour of the Revolution she was an object of fanatical hatred to the mob of Paris, who knew that she was conspiring with her brother, Leopold II of Austria, for the reestablishment of the absolute monarchy. In hours of crisis her resolute bearing spurred on the weak-willed Louis XVI to spasmodic assertions of his authority without bringing him to take a decisive step in defense of his rights. After the removal of the royal

family from Versailles to the Tuileries (Oct. 6, 1789) she attempted on various occasions to conciliate the good will of the people, but failed before the vindictive enmity of the Parisian populace. Out of personal antipathy to Mirabeau she could not be brought to accept the aid of the man who alone might have saved the monarchy from destruction. At last she resolved on flight. Her husband long refused to abandon his country, but she could not go without him, and finally the King consented. The flight took place on the night of June 20, but the royal fugitives were recognized and turned back at Varennes. The flight to Varennes only served to confirm the popular belief as to the Queen's intrigue with foreign powers, and, as a matter of fact, there is no doubt that Marie Antoinette had corresponded and continued to correspond with her brother relative to the invasion of France by an Austrian army for the purpose of rescuing the royal family. On June 20, 1792, a mob invaded the Tuileries, forced Louis XVI to don a liberty cap, and heaped insults on the Queen as they filed past her. On August 10 came the final storming of the Tuileries. Marie Antoinette's guards were murdered at her chamber door, and the unhappy Queen was compelled to seek refuge with her husband in the hall of the Convention, whence they were consigned on the 13th as prisoners to the Temple. Louis XVI was executed on Jan. 21, 1793. Marie Antoinette was separated from her son July 3, 1793, and on August 1 was removed to the Conciergerie. Twice while she was a prisoner in the Temple were unsuccessful attempts made to effect her escape. On October 14 she was brought before the Revolutionary Tribunal and charged with fomenting civil war and lending counsel to the foreign enemies of France. Testimony against her was given by Hébert, who sought to blacken her personal character with trumped-up charges. She was found guilty of treason after a two days' trial, was condemned to death on October 16, and was executed the same day.

The tragic fate of Marie Antoinette has given rise to a voluminous literature, in which the Queen has been depicted now as the victim, the sainted martyr, of the Revolution, now as the embodiment of the luxury, stupidity, and apathy towards the miseries of the people which characterized the powers of the old régime.

Bibliography. The memoirs of Madame de Campan, lady in waiting to the Queen, are inaccurate but important. They were first published in France in 1822 and have since appeared in numerous French and English editions. The latest edition in English is entitled *Memoirs on Marie Antoinette and her Court* (2 vols., Boston, 1909). Much of the Queen's correspondence has been published by Von Arneth, D'Hunolstein, De Reiset, F. Feuillet des Couches, and Geffroy. The memoirs of the Prince de Ligne and the Duke de Choiseul are of value. Other memoirs by contemporaries are: J. Weber, *Mémoires concernant Marie-Antoinette* (London, 1804-09); *Mémoires de M. le baron de Besenval* (Paris, 1805); *Mémoires de la baronne d'Oberkirch* (ib., 1853); E. Bavoux, *Mémoires secrets de J. M. Augeard, secrétaire des commandements de la reine Marie-Antoinette* (ib., 1866); Madame Vigée-Le-Brun, *Mes souvenirs* (ib., 1867); *Mémoires de Mme. la duchesse de Tourzel* edited by the Duc de Cars (ib., 1883). Consult also: Jacob, "Ueber den politischen Einfluss der Königin Marie Antoinette, von Frankreich," in

Historisches Taschenbuch, vol. ix (Leipzig, 1838), with a list of authorities; E. and J. de Goncourt, *Histoire de Marie Antoinette* (6th ed., Paris, 1884); A. L. Imbert de Saint-Amand, *Marie Antoinette and the End of the Old Regime* (New York, 1896); A. L. Bicknell, *The Story of Marie Antoinette* (ib., 1897); A. L. Imbert de Saint-Amand, *Marie Antoinette and the Downfall of Royalty* (New York, 1898); Hilaire Belloc, *Marie Antoinette* (ib., 1909); A. C. P. Haggard, *Louis XVI and Marie Antoinette* (2 vols., London, 1909); Pierre Ladoué, *Les panégyristes de Louis XVI et de Marie Antoinette depuis 1793 jusqu'à 1912: essai de bibliographie raisonnée* (Paris, 1912); O. G. von Heidenstam, *Marie Antoinette, Fersen, et Barnave: leur correspondance* (ib., 1913).

MARIE CHARLOTTE AMÉLIE. See CARLOTTA.

MARIE DE FRANCE, de fräns (twelfth century). The earliest French poet. She was born in France. She dedicated her fables to a certain William, whom some have identified with William Longsword of Salisbury; and she alludes in her *Fables* to a king, sometimes identified with Henry III of England. If these hypotheses be correct, it would appear that she lived in England and in the early thirteenth century, but textual evidence points to an earlier date. She wrote *Lais* and a collection of animal fables, a so-called *Ysopet*. A poem of 2300 lines on St. Patrick's purgatory (*L'Espugatoire Seint Patriz*) she derived from a Latin treatise by Henry of Saltrey, written before 1185. The *Lais* are 14 narrative poems, ranging in length from 100 to 1200 verses. Of these the best known is the *Chèvrefeuille*, describing an episode in the loves of Tristan and Iseult (Isolde); the finest is *Eliduc*. Noteworthy also are *Le rossignol*, *Les deux amants*, *Yonec* (a fairy tale of the bluebird), and *Lanval*. These Marie got from Kymric sources. Marie says she translated her 103 fables from an English version by King Alfred (*roi Alvez*), or, as two manuscripts read, "King Henry." The English version from which she worked is lost; the Latin that stood behind it comprised nearly all the collection of Romulus (ninth century), supplemented from the Jewish-Oriental fables preserved in the collection of Berachyah and Pisore Alphonse, and apparently also from early native sources. The poems of Marie de France are edited by Roquefort (Paris, 1820), and better by Warnke in vol. iii of *Bibliotheca Normannica*, with an essay by Röhler (Halle, 1885). Consult: Bédier, "Les Lais de Marie de France," in *Revue des Deux Mondes* (Paris, 1891), and on the *Ysopet*, a chapter by Sudre in *Petit de Julleville, Histoire de la langue et de la littérature française*, vol. ii (ib., 1896); also: Warnke, *Die Quellen des Esope der Marie de France* (Halle, 1900); *Marie de France: Seven of her Lays Done into English*, by Edith Rickert (London, 1901); *Three Lays of Marie de France Retold in English Verse*, by F. B. Luquiens (New York, 1911), containing a bibliography; Alice Kemp-Welch, *Of Six Mediæval Women* (London, 1913).

MARIE DE' MEDICI. See MARIA DE' MEDICI.

MARIE GALANTE, gá'lánt'. An island in the West Indies, one of the Lesser Antilles. It

belongs to France and lies 17 miles southeast of Guadeloupe, of which it is an administrative dependency (Map: West Indies, G 4). It is nearly circular in shape; area, 58 square miles. It consists of a limestone plateau, 300 to 600 feet high, surrounded by steep rocky shores. The climate is healthful and the soil is fertile, the chief products being sugar, coffee, and cotton. The chief town is Grandbourg, on the southwest coast. The population in 1901 was 15,181, consisting mostly of negroes and mulattoes. Marie Galante is so called from the name of the ship commanded by Columbus when he discovered the island in 1493.

MARIENBAD, mā-rē'en-băt. A famous watering place of Europe, situated near the west border of Bohemia, Austria, amidst pine-clad hills, at an altitude of 2060 feet, 36 miles northwest of Pilsen (Map: Austria, C 2). The visitors number about 30,000 annually. It is a small town, with a fine Roman Catholic church (1844-50) in Byzantine style, a tasteful synagogue, English and Russian churches, a theatre, four baths, including the Neubad, built in 1895, and a military Kurhaus. Its fine promenading grounds are adorned with monuments. Its 10 springs containing Glauber's salt do not differ essentially from those of Karlsbad except that they are cold. They range in temperature from 48° F. to 53° F. The principal springs are the saline Kreuzbrunnen and Ferdinandsbrunnen, used both for bathing and drinking. They yield yearly over a million bottles for export. The Marienquelle is used only for bathing, and contains a large proportion of carbonic acid. The chalybeate Ambrosius- and Karolinenbrunnen are used both for drinking and for bathing. Besides the above-mentioned springs there are mud baths and a hydropathic establishment. Considerable quantities of salt are exported. Although the springs of Marienbad enjoyed a local reputation long before the nineteenth century, it was only in 1808 that the first bathing establishment was opened and the place assumed its present name. Pop., 1900, 4588; 1910, 6280, chiefly Germans.

MARIENBURG, mā-rē'en-burk. An old town in the Province of West Prussia, 30 miles south-southeast of Danzig, on the Nogat River (Map: Germany, H 1). It is chiefly interesting because it was for one and a half centuries the seat of the grand masters of the Teutonic Order. These knights built the Marienburg Schloss, one of the largest and most strongly fortified buildings in Germany and one of the most remarkable secular buildings of the Middle Ages. It has a sixteenth-century town hall, a notable monument to Frederick the Great, a teachers' seminary, a Gymnasium, and an agricultural school. Marienburg remained in the hands of the Knights till 1457, when it was taken by the Poles. Marienburg was occupied by the Russians during their first offensive campaign against the Germans in the European War which began in 1914. They were later compelled to evacuate it. (See WAR IN EUROPE.) The town has large wool-cleaning works and manufactures machinery, chemicals, pottery, bricks, and cotton wadding. It trades in grain, wood, linen, and horses. Pop., 1900, 10,732; 1910, 14,019. Consult Bergau, *Das Ordenshauptaus Marienburg in Prussia* (Berlin, 1871).

MARIENWERDER, mā-rē'en-vēr'dēr. A town in the Prussian Province of West Prussia, on a tributary of the Vistula, 45 miles south of

Danzig (Map: Germany, H 2). It has a fourteenth-century cathedral with tombs of the grand masters of the Teutonic Order and a castle built by the Teutonic Knights, the founders of the town in 1233. The principal industries are sugar refining and the manufacture of cloth, machinery, lumber, print goods, soap, vinegar, and dairy products. There is a considerable trade in fruit. Pop., 1900, 9686; 1910, 12,983.

MARIE THÉRÈSE, mā-rē' tār'ez', OF AUSTRIA (1638-83). A wife of Louis XIV of France, daughter of Philip IV of Spain, born in Madrid. By the terms of the Peace of the Pyrenees (1659) she was married to Louis XIV (1660), giving up all claims to the Spanish throne. She lived very unhappily with Louis, but at length seemed to find comfort in religion. Consult H. L. Duclos, *Mme. de la Vallière et Marie Thérèse* (2d ed., 2 vols., Paris, 1870).

MARIETON, mā-rē'atōn', PAUL (1862-1911). A French poet and critic, born at Lyons. He early became associated with the Provençal movement in southern France and took a prominent part in that revival. (See FÉLIBRIGE.) He was the founder and editor of the *Revue Félibréenne*. His writings include: *Souvenance* (1884); *La viole d'amour* (1886); *Hellas* (1888); *La terre provençale* (1890); *Le voyage des Félibres et des Cigaliers sur le Rhône et le littoral* (1892); *Le livre de mélancolie* (1896); *Une histoire d'amour: George Sand et Alfred de Musset* (1897; 2d ed., 1903); *Le voyage des Félibres et des Cigaliers sur le Rhône et Vaucluse* (1895); *Jasmin* (1798-1864) (1898); *Hippolyta* (1902); *Le théâtre antique d'Orange et ses représentations* (1903, 1908); *Les épiigrammes* (1909).

MARIETTA, mā-rī-ēt'ā or mār'ī-. A city and the county seat of Cobb Co., Ga., 20 miles north by west of Atlanta, on the Louisville and Nashville, the Nashville, Chattanooga, and St. Louis, and the Western and Atlantic railroads (Map: Georgia, B 2). It has the Clarke Library and a city park. In the large National Cemetery here there are 10,532 graves, 2967 of unknown dead. Kenesaw Mountain (q.v.) is situated a short distance west. The city is the centre of a farming and stock-raising district and has extensive marble works, chair factories, knitting mills, machine works, table factory, etc. Marietta, first incorporated in 1852, is governed, under a charter of 1885, by a mayor, elected biennially, and a city council, chosen at large. The water works and electric-light plant are owned by the municipality. Pop., 1900, 4446; 1910, 5949.

MARIETTA. A city and the county seat of Washington Co., Ohio, 115 miles by rail southeast of Columbus, at the junction of the Ohio and the Muskingum rivers, the former being spanned by a bridge connecting with Williamstown, W. Va., and on the Baltimore and Ohio, the Pennsylvania Company, and the Marietta, Columbus, and Ohio railroads (Map: Ohio, H 7). It is the seat of Marietta College (q.v.), with a large library, and has a city park, set apart in 1788, and the oldest church organization and the oldest building in the Northwest Territory. The latter, known as the "Two-Horned Church," was once the office of the Ohio Land Company. It was destroyed by fire in 1905, but has since been rebuilt of brick along its original lines. In the cemetery here are buried many Revolutionary soldiers. The city is in an agricultural, petroleum, and coal region,

has large commercial interests through its river trade, and it manufactures flour, lumber products, stoves, tables and furniture, cars, tanned leather, carriages and wagons, refined petroleum, boats, oil-well tools, boilers, wooden bicycle rims, brick, harness, glass, caskets, etc. The government is administered under the Ohio municipal code of 1902 by a mayor, a unicameral council, a board of public safety appointed by the mayor with the concurrence of two-thirds of the council, and a board of public service elected by the people. All these officers are chosen for a term of two years. The city owns and operates the water works and electric-light plant. Pop., 1900, 13,348; 1910, 12,923; 1920, 15,140.

Marietta, the first settlement within the present limits of Ohio, was founded in 1788 by Rufus Putnam and a colony from New England under the authority of the Ohio Company (q.v.). It was named in honor of Marie Antoinette. In July, 1788, the Northwest Territory was formally organized here by Governor Arthur St. Clair. Blennerhasset Island, 12 miles below, was the scene of various incidents in the Burr Conspiracy. Marietta was first incorporated, as a town, in 1800. In 1890 the village of Harmar, where, in 1785, Fort Harmar had been built, was annexed. Consult Hoar, *Oration at the Celebration of the Centennial of the Founding of the Northwest at Marietta* (Washington, 1888).

MARIETTA COLLEGE. A coeducational institution of learning at Marietta, Ohio, founded as Muskingum Academy in 1797 by pioneers of the Ohio Company, chartered in 1835. It has a regular college course leading to the B.A. degree. The library, of over 60,000 volumes, is especially strong in the history of the old Northwest Territory. In 1914-15 the college had a faculty of 17 instructors and an attendance of 200. Its endowment was \$700,000, its income \$40,000, the value of its grounds and buildings \$350,000, and the total value of the college property \$1,000,000. The president in 1915 was George W. Hinman, Ph.D.

MARIETTE, mǎ'rê'et, AUGUSTE EDOUARD (1821-81). A French Egyptologist, born at Boulogne-sur-Mer. He became in 1849 assistant in the Egyptian museum at the Louvre. He was sent to Egypt to collect Coptic manuscripts, but there became interested in the ruins of Memphis and in excavations. Aided financially by the French government and by the Duke de Luynes, he excavated, in 1851, the Serapeum near the modern Sakkara and the tombs of the Apis bulls, finding thousands of inscriptions and statues, as well as many mummies of sacred bulls and cows, which went chiefly to Paris. In 1854 he returned to Paris and was made curator in the Egyptian Museum. In 1858 he went to Egypt and became director of the governmental excavations and curator of the monuments. Acting in this capacity, he cleared most of the ancient temples, the great Sphinx, the tombs at Sakkara, and other historic spots from sand and rubbish, and formed the Egyptian National Museum. In 1873 he received the biennial prize of 20,000 francs from the Institute of France. The Egyptian government gave him the title of Bey, later that of Pasha. He died in 1881 and was buried in a huge stone sarcophagus standing before the museum. He produced, with the aid of collaborators and draftsmen, many books, among them: *Mémoire sur la mère d'Apis* (1856); *Renseignements sur les 64 apis trouvés dans les souterrains du Sérapéum* (1856);

Choix de monuments et de dessins, découverts ou exécutés pendant le déblayement du Sérapéum de Memphis (1856); *Le Sérapéum de Memphis* (1857 et seq.); *Aperçu de l'histoire d'Égypte* (1867); *Abydos* (1870); *Les papyrus égyptiens du musée de Boulaq* (1872-77); *Denderah* (1869-75); *Monuments divers* (1872-82); *Deir-el-Bahari* (1877); *Karnak* (1875); *Voyage dans la Haute Égypte* (1878; 2d ed., 1893); *Catalogue des monuments d'Abydos* (1880); *Les Mastabas de l'ancien empire* (1881-89). The *Œuvres diverses d'Auguste Mariette*, edited by Maspero, began to appear in Paris in 1904. Consult Edouard Mariette, *Mariette Pacha* (Paris, 1904), and G. C. C. Maspero, *Notice biographique sur Auguste Mariette* (ib., 1905).

MARIGLIANO, mǎ'rê-lyǎ'nô. A town in the Province of Caserta, Italy, 10 miles northeast of Naples. It has a fine church and a palace. It manufactures spirits and markets grain and wine. Pop. (commune), 1901, 12,491; 1911, 12,502.

MARIGNANO, mǎ'rê-nyǎ'nô. See MELEGNANO.

MARIGNOLLI, mǎ'rên-yô'l'lê, GIOVANNI DE' (fl. 1290-1357). An Italian traveler, born at Florence. He was one of four legates of Pope Benedict XII to the court of the Khan of Cathay. Starting in 1338 he reached Peking in 1342 and remained there three or four years. He traveled in eastern China; after leaving that country he discovered a church of the Latin communion at Columbum in Malabar in 1348; made a long sea voyage down the coast and probably to Java; and on his return voyage was detained in Ceylon by a native ruler. By 1353 he had returned to Europe and delivered a letter from the Khan to Pope Innocent VI. He became a chaplain of Emperor Charles IV in 1354 and Envoy to the Pope from Florence in 1356. The story of his travels was brought to light by J. G. Meinert in 1820.

MARIGNY, mǎ'rê'nyê', ENGUERRAND DE (1260-1315). A French statesman and financier, born at Lyons-la-Forêt, Normandy. He became grand chamberlain and chief minister of Philip IV the Fair in 1304. He received many favors from Philip and from Edward II of England, but his share in the debasement of the French coinage made him unpopular. When Philip died in 1314, Marigny became a victim of the feudal reaction against the increasing royal power. He was accused of malfeasance in office and of treachery to the King, but his accounts were found to be correct. Louis X, however, permitted him to be convicted on a charge of sorcery, and he was hanged.

MARIGOLD (*Mary*, in allusion to the Virgin Mary, *gold*). A name given to certain plants of the family Compositæ, chiefly of the genera *Calendula* and *Tagetes*. The genus *Calendula* comprises about 20 annual and perennial herbs and shrubs, of which some of the former are found in the countries bordering on the Mediterranean, the latter chiefly in South Africa. Pot marigold (*Calendula officinalis*) is a common cultivated annual, native of southern Europe, with an erect stem, 1 to 2 feet high, obovate lower leaves on long stalks, and large, deep-yellow flowers. There are a number of varieties, some of which have double flowers. The whole plant has a slight aromatic odor and a bitter taste. The dried florets are often employed to adulterate saffron and sometimes for coloring butter or cheese. They are also used

in the preparation of soups. The plants are propagated by seeds sown in spring in ordinary garden soil in sunny or half-shady places. Later they are thinned to about one foot apart. The genus *Tagetes* consists of annual and perennial herbs, natives of the warmer parts of America from Arizona to Argentina. Although *Tagetes erecta*, one of those most frequently cultivated, bears the name of African marigold, and *Tagetes patula*, another well-known annual, is called French marigold, both species are Mexican. Corn marigold is *Chrysanthemum segetum*. Marsh marigold (*Caltha palustris*) has no botanical affinity with the true marigolds. *Bidens beckii* is called water marigold.

MARIKINA, mār'i-kē'nā. See MARMOSSET.

MARILLAC, mār'ē'yāk', CHARLES DE (1510-60). A French diplomat, born in Auvergne. He became an advocate in Paris; in 1535 went to Constantinople, where he became Ambassador shortly after; and in 1538-43 was Ambassador to Henry VIII of England. From 1547 to 1551 he served in the same capacity in Switzerland and at the court of Emperor Charles V, and in 1555 was one of the negotiators of the Peace of Ardres with England. In recognition of his services he was made Bishop of Vannes in 1550, Archbishop of Vienne in 1557, and a Councilor of State. He played a leading part in the Assembly of Notables at Fontainebleau in 1560, but his policies aroused the enmity of the Guises. He wrote *Discours sur la rouverte de la Trefve en l'an 1556* (1556).

MARINA, mā-rē'nā, or MALINTZIN, māl'ēn-tsēn'. A Mexican woman. She was born in Coatzacoalcas, probably in the early years of the sixteenth century. She was of a noble family, but when a child was sold in slavery to the Tabascan Indians. Soon after Cortés invaded Mexico she became his interpreter and his mistress. She constantly acted as intermediary between the Spanish and the natives, and thus became prominent in all the affairs of the Conquest. Their son, Don Martín Cortés, attained considerable importance in Mexico. She was afterward married to Juan de Jaramillo and was living as late as 1550.

MARINDUQUE, mār'ēn-dōō'kā. One of the Philippine Islands, situated in the Visayan Sea, 19 miles south of the Isthmus of Tayabas, separating North from South Luzon (Map: Philippine Islands, C 4). It is roughly circular in shape, with a diameter of 24 miles and an area of 667 square miles. Its coast line has four good harbors. Its surface is hilly, with a maximum altitude near the centre of probably 2500 feet. The interior is forested, with some fine grazing grounds. The principal occupations of the inhabitants are cattle raising and the cultivation of rice, coconuts, and hemp. Copra is manufactured and exported. Pop., 1903, 51,674, almost entirely Tagalog. Marinduque was a separate province until June 23, 1902, when the large island of Mindoro (q.v.) was annexed to it; it forms now a subprovince of the Province of Tayabas, Luzon. The capital is Boac (q.v.). Marinduque is a port of call on the main line of communication between Luzon and Mindanao.

MARINE, mā-rēn', MERCHANT, OF THE UNITED STATES. See MERCHANT MARINE OF THE UNITED STATES; UNITED STATES, passim; SUBSIDIES; SHIPBUILDING.

MARINE CITY. A city in St. Clair Co., Mich., 46 miles (direct) northeast of Detroit, on the St. Clair River and on the Rapid Rail-

road, a freight line (Map: Michigan, G 6). It is a residential city and summer resort. Important industries are the manufacture of salt and beet sugar and the building of wooden vessels for the Great Lakes. The water works are owned by the municipality. Pop., 1910, 3770.

MARINE CORPS (OF., Fr. *marin*, from Lat. *marinus*, pertaining to the sea, from *mare*, sea; connected with Goth. *marei*, AS. *mere*, OHG. *marī*, Ger. *Meer*, Ir. *muir*, OChurch Slav. *morye*, Lith. *māras*, sea; possibly connected with Gk. βρύξ, *bryx*, sea depth). A body of soldiers enlisted for service in the navy. While the marines, as they are called, are by many regarded as a relic of the days when the fighting complement of ships consisted of soldiers, this is not strictly true. Three hundred years ago, when the heavy gun displaced the ram as the principal naval weapon of offense, the soldiers on board ship rapidly decreased in numbers and importance and soon disappeared from the ships altogether. After a few years' absence they were brought back again. In 1653 Admiral Blake embarked a number on his ships to act as riflemen in his action against Van Tromp. Their efficiency probably led to the establishment of the British marine corps in 1664, but afterward it was several times wholly or partly abolished.

The value of well-trained and expert riflemen in the close-fought actions and frequent hand-to-hand encounters of the seventeenth, eighteenth, and nineteenth centuries was so great as to cause marines to form important parts of the complements of all men-of-war of those days. They were, moreover, of much use as a police force for controlling the mixed, ignorant, and often mutinous sailors who composed the crews in the days of the press gang and indiscriminate enlistment.

The United States marine corps was established by Act of Congress dated June 25, 1776, and provided for the appointment of one major (Samuel Nichols), nine captains, and ten first lieutenants. After the close of the Revolution the navy was practically abolished, and, with the other branches of the service, the marine corps disappeared. When the reorganization of the navy took place in 1798, the marine corps was again established with an authorized strength of 881 officers and men commanded by a major.

During the first 75 years of the nineteenth century the marine corps was one of the most important and distinguished parts of the navy, both afloat and ashore. Its officers and men added lustre to their name in the naval operations on the Barbary coast, in the War of 1812, and in the Civil War. But with the advent of the high-power gun the battle range increased to such an extent that riflemen were no longer of use in naval action, and the removal of marines from ships began to be urged. The arguments to this end were given added force by the fact that marines were no longer needed for ship-board police on account of the greatly improved character of the enlisted force of the navy. The removal might have taken place but for the contemporary total abolition of sails on fighting ships, which obviated the necessity for a ship's company composed wholly of sailors of the old type. It was therefore possible to find a place for a limited number of well-trained riflemen who could be utilized at the smaller guns. Then came the Spanish War and furnished its lesson as to the value of a military expeditionary force

to accompany the fleet, not only wholly under naval control, but thoroughly conversant with the practical needs of the vessels and of the service generally. The marine corps, therefore, shared in the general naval expansion which followed the war and has continued to increase as the navy has developed.

At present marines form about 10 per cent of the complements of large ships in the United States navy and are found most useful in landing operations for the protection of American citizens and their property in regions disturbed by war or insurrection. The sailors are drilled as infantry and artillery, but as their chief duties are connected with the main battery of the ship, when they are landed the battle organization of the vessel is entirely broken up, so that they cannot be spared without greatly weakening the efficiency of the ship.

Less than one-third the marine corps is on shipboard. The remainder is distributed in barracks in or near the principal naval stations. During the prevalence of ordinary conditions they act as guards and military police forces at these stations, but they are organized and trained as regiments or parts of regiments and are ready for mobilizing at any time as an expeditionary force of one to six regiments (two are usually in the Philippines) for immediate service wherever American interests are threatened by revolutionary disturbances abroad; or, in case of war, to be sent to seize certain foreign places, to establish a fortified advance base, or to protect weak or threatened points. They are carried in naval transports, conveyed by fighting ships, and accompanied by freight and supply ships if advance base and other materials are needed in quantities to make this necessary.

The commandant of the corps is a major general. The staff consisted (1915) of one adjutant and inspector, one quartermaster, and one paymaster, all with the rank of colonel. As assistants in these staff departments there are: 5 lieutenant colonels, 8 majors, and 13 captains. The line consists of 8 colonels, 7 lieutenant colonels, 8 majors, 94 captains, 97 first lieutenants, 89 second lieutenants, and 9921 noncommissioned officers and privates. Consult: J. F. Cooper, *History of the Navy* (New York, 1866); R. S. Collum, *The History of the Marine Corps* (ib., 1902); McLaughlin and Hart (eds.), *Cyclopedia of American Government*, vol. ii (ib., 1914); also, the works of Maclay, Spears, and other naval historians.

Marine Corps in Foreign Navies. France, Austria, Spain, Japan, and Greece have no marines. Argentina, Brazil, Italy, Germany, and the Netherlands have marine infantry. Chile has marine infantry and artillery. Denmark has marine artillery. Russia has marine infantry and artillery in large numbers. Most of the troops of these countries are used at naval stations and in the colonies; few are used on board ship except in the Russian navy. The British marine corps is very similar to the American, except that it is divided into marine infantry and marine artillery. It was established in 1664 and was at first called the Admiral's Regiment. At this time the irregular methods of obtaining crews for men-of-war and the lack of regulation of the naval forces made the presence of such a disciplined force necessary. Impressment and the dissatisfaction engendered by the various methods of forced service continued the necessity for nearly 200 years.

While no longer required for their original purpose, they still form a valuable part of the British navy. The budget for 1914-15 provided for 428 commissioned officers, 85 warrant officers, 1353 staff sergeants and sergeants, 1801 band ranks, buglers, and music, 227 band boys, and 14,691 rank and file.

MARINED, mǎ-rënd'. A term in heraldry, applied to an animal whose lower extremity terminates in a tail like that of a fish. See **HERALDRY**.

MARINE DISASTERS. See **SAFETY AT SEA**.

MARINE ELEVATOR. See **GRAIN ELEVATOR**.

MARINE ENGINEERING. That branch of the science and art of engineering which concerns itself with the propulsion of ships and the design and operation of ship machinery of all kinds. At one time it was solely concerned with steam engineering, but such is no longer the case, for ships not only have auxiliary machinery driven by electric power or internal-combustion engines, but many ships are propelled by them. The different parts of the subject are considered or treated under the heads of **BOILER**; **DYNAMO-ELECTRIC MACHINERY**; **INTERNAL-COMBUSTION ENGINE**; **SCREW PROPELLER**; **SHIP**; **SHIPBUILDING**; **SHIPPING**; **STEAM ENGINE**.

MARINE GLUE. See **CEMENT**; **GLUE**.

MARINE HOSPITAL SERVICE. See **PUBLIC HEALTH SERVICE**.

MARINE INSURANCE. The practice of marine insurance, at least on a purely commercial basis, antedates by centuries the application of the insurance principle to other kinds of risks. Even in ancient times there was developed a system of quasi-insurance in the form of loans on bottomry by which risks were at least partially transferred. In the Middle Ages marine insurance on a commercial basis first appeared as early as the thirteenth century in Flanders and in Portugal. The oldest legal document relating to insurance which has come down to us consists of the ordinances issued by the magistrates of Barcelona in 1435 to regulate the business of marine insurance. Marine underwriting appears to have been introduced into England by the Lombards early in the sixteenth century. By the eighteenth century that country had obtained the leading position in the business, which she has since maintained.

For many years marine underwriting in England was carried on exclusively by unassociated individuals and continued to be conducted on a strictly individual basis until late in the eighteenth century. The first step towards the regulation of marine underwriting by the **Lloyds Association** (see **LLOYDS**) was taken in 1779, when a printed form of policy was adopted, practically the same as the one still in use. In 1871 the **Lloyds Association** was incorporated by Act of Parliament, the articles of incorporation stating as the main objects of the organization the conduct of the business of marine insurance, the protection of the interests of the members of the association, and the collection and publication of information in regard to shipping. It is for the accomplishment of the last-named purpose that the association has developed its remarkable system of agencies, whose intelligence and dispatch in gathering and reporting shipping news are unequalled in any similar organization. Marine underwriting at **Lloyds** is still exclusively an individual transaction, though under the general supervision of the association. The

method of transacting business is as follows: A merchant having a ship to insure sends through a broker a slip setting forth the characteristics of the risk he desires insured. Any underwriter who desires to assume a part of the risk places on the slip his initials and the amount he is willing to assume. No one underwriter assumes very large risks, a ship and cargo being usually underwritten by a large number of individuals, each of whom carries from £100 to £500. The responsibility of each underwriter is limited to the amount for which he has subscribed. When the entire amount has been subscribed, the policy is made out and signed by those who have already put their initials on the slip.

In the seventeenth century two insurance companies, the Royal Exchange and the London, were authorized to transact a marine business, while the privilege was denied to all other companies. These two companies appear to have done little marine underwriting. In 1824 the monopoly restriction was removed, and since that time many companies have gone into the business. Even these companies, however, find it advantageous to work through Lloyds, each of them having a representative on the floor of that association.

In America marine insurance was the first form to be written. In 1759 the first office was established, although a large amount of individual underwriting had previously been carried on. This office was opened in New York and was known as the Old Insurance Office. The method of conducting business was by individual underwriting, after the manner of the English Lloyds.

It was not until near the end of the eighteenth century that corporations took up the business of marine underwriting. The first in the field were the Insurance Company of North America and the Insurance Company of the State of Pennsylvania. Both were located in Philadelphia, and both began marine underwriting in 1794. The growth of the business was rapid and was greatly stimulated by the expansion of American shipping during the period of the Napoleonic wars in Europe. The companies rapidly absorbed the entire business of the country, and by the year 1825 individual underwriting was practically at an end in the United States.

The period of the Civil War subjected the marine companies to a severe strain, and several of them succumbed. Since that time the condition of marine underwriting has reflected the condition of the shipping industry of the country. The great growth of the business has been seen, not in the insurance of risks on the high seas, but in the insurance of risks on inland waters. The headquarters for the insurance of shipping on the lakes is Chicago. The business is especially hazardous on account of the limited area over which the operations extend and a consequent great fluctuation in loss rate.

Upon the outbreak of the European War in 1914 the difficulties encountered by American shipping led to the passage by Congress of an Act to establish a bureau of war risks in the Treasury Department. The Act was signed by the President on Aug. 19, 1914, and went into effect immediately. The Secretary of the Treasury was authorized to appoint a director and other officers of the bureau and to aid the bureau in fixing premiums and in adjusting payments for losses. The function of the bureau

was to insure American ships and cargoes therein against loss or damage by risk of war whenever it appeared to the Secretary impossible for American shippers to secure war-risk insurance on terms substantially equal to those given foreign vessels or cargoes by their respective governments. An appropriation of \$5,000,000 was made to inaugurate the system, in addition to \$100,000 to defray the expenses of the bureau. The President was authorized to suspend the operation of the Act as soon as the necessity of war-risk insurance should disappear. In any event the Act was limited to two years from the date of enactment.

The general principles on which marine insurance is based are not different from those underlying other forms of insurance, but in practice the former presents a number of peculiar features.

The Policy. The common form of marine policy is the voyage policy, i.e., a policy to be in force for a voyage from one specified port to another. Occasionally, however, a ship is insured under a time policy, which is to be in force for a specified time, usually a year. The chief practical distinction between the two is that with a voyage policy there is always a warranty, express or implied, that the ship is seaworthy at the beginning of the voyage, while with a time policy no such warranty is implied.

An open policy is one which provides that in case of total loss the amount of the indemnity shall be determined by ascertaining the amount of loss actually suffered. It is incumbent upon the insured to prove the value of the destroyed property. A valued policy, on the other hand, provides that in case of total loss the amount stated in the policy shall be regarded as the value of the insured property and paid as indemnity. Valued policies are more frequently issued on the ship, while the cargo is more commonly covered by an open policy. The use of the valued policy has undoubtedly tended to increase the amount of overinsurance and deliberate destruction of vessels. This practice is especially easy under the system of individual underwriting prevailing at Lloyds, since the underwriter frequently knows little or nothing about the ship he is insuring beyond what is stated in the slip.

Objects. The objects most commonly insured under a marine policy are ship, cargo, and freights. Sometimes other objects are covered, such as the expected profits of the voyage or, more frequently, the liability for damages on account of collision. The insurance of freight is an illustration of a peculiar feature of marine insurance. In all other forms of insurance of property the amount of indemnity that can be recovered in case of loss is determined by the value of the property destroyed, *damnum emergens*. In marine insurance it is possible to insure an expected gain and to obtain indemnity if the occurrence of any of the events covered by the policy makes it impossible to realize the gain, *lucrum cessans*.

Dangers. A marine policy covers a far greater number and variety of dangers than any other form of policy issued. Besides the more characteristic perils of the seas, such as wind and wave, fire, collision, stranding, jettison, and the like, the policy covers three distinct kinds of danger—war risks, including detention as well as capture or destruction; pirates, rovers, and thieves; and barratry, or illegal acts of captain

or crew. As to the losses caused by the perils of the sea, they must be due to extraordinary action of wind and wave or to some other unusual cause. The losses caused by ordinary forces are known as wear and tear and are not covered by the insurance. The distinction between the two kinds of losses has been the subject of much litigation, and the present condition of the law of the subject is precise but complex. Modern policies cover some further kinds of loss, especially liability for damages on account of collision.

Insurance after the Loss. Uncertainty as to the fate of a vessel may continue for an indefinite time after the loss has occurred. Insurance may be taken out on an overdue ship, and even though it should afterward appear that the vessel had already suffered shipwreck at the time when the insurance was effected, the indemnity could still be collected. The premium rate on an overdue ship indicates the judgment of the underwriters as to the probability that the vessel has already suffered disaster.

Reinsurance. Individual underwriters enjoy only to a limited extent the advantages that come from the combination of a large number of risks in a group, and consequently single losses may involve a considerable share of their capital. They avoid this danger partly by underwriting only a small portion of the value of each ship they insure and partly by resorting to reinsurance. As it is always possible to insure a ship so long as it is unknown whether she suffered disaster or not, it is customary for those who have insurance in force on a vessel that is overdue to protect themselves by reinsuring her. They are naturally obliged to pay higher premiums than they themselves received. If this process of reinsurance is repeated several times, as is frequently the case, the effect is that a loss is distributed in small proportions over a large number of underwriters.

The Loss. Loss may be complete or partial. When it is complete the settlement between the insured and the underwriters is comparatively simple. On a valued policy an insurer becomes liable for the amount stated in the face of the policy. In the case of an open policy it is necessary for the insured to prove the value of the property destroyed or the amount of freight lost. Unless otherwise agreed, the value of the ship is its value at the time of starting on the voyage with the value of the ship's stores included; the value of the cargo is its invoice value with the addition of insurance premium and other charges; and the value of the freight is the amount the ship would have earned if she had reached her destination in safety.

Abandonment. A peculiar feature of marine insurance is the practice of abandonment, when the insured surrenders or abandons to the underwriters the property covered by the policy and demands his entire indemnity. This right does not always exist, but arises only when the insured property has suffered so serious damage from perils covered by the policy that it amounts to constructive total loss. With regard to the ship or the cargo there is held to be constructive total loss when the damage exceeds one-half the value of the vessel or cargo respectively and when the vessel is captured by the enemy or detained by embargo. There is constructive total loss of cargo when it is so badly injured that it has to be sold at some other place than its original destination. There is constructive loss of

freight when the ship is unable to complete her voyage, or the goods on which the freight is to be paid are so badly damaged that they cannot be carried to their original destination.

When the conditions are such as to give a legal right to abandon, it is optional with the insured whether he will take advantage of the right or not. If he decides to do so he must give notice to the insurer within a reasonable time; and having once elected to abandon, it is impossible for him to draw back. The effect of abandonment is to vest the title to the insured property in the underwriter and to convey to him all rights and claims on account of the ship and cargo.

Average. When there is partial loss and the insured cannot or does not elect to abandon and receive the entire indemnity, it becomes necessary to ascertain the amount for which the insurer is liable. Such partial losses are known by the name of "average," a term borrowed by marine insurance from general maritime law. It is frequently necessary to sacrifice some part of the ship or cargo in order to save the rest. It is obviously unjust to have the entire burden of loss under such circumstances fall upon the party whose property is thus voluntarily destroyed or injured. Maritime law, therefore, prescribes the way in which such losses shall be apportioned or averaged among all the interests at stake. The term "average" was later extended to include losses of all kinds. To distinguish those losses which are of such a nature that they ought to be apportioned among all the parties from those which ought to be borne entirely by the party whose property is damaged, the former kind of loss is called general average, the latter particular average. In the case of the ship, the voluntary cutting away of a mast to save the ship would be general average; the loss of a mast through the violence of the wind would be particular average. There is general average on the cargo when a part of it is jettisoned or thrown overboard to lighten the ship; there is particular average when a part of it is damaged as the result of the action of forces which are included in the policy. So far as the insurance is concerned, it is the general rule that the insurer is liable for all general averages under all conditions, in the absence of fraud. His liability for particular average, however, is usually limited in the policy. For certain kinds of commodities the policy exempts the insurer from all liability; for others, from liability for losses of less than 5 per cent or some other specified proportion, unless the ship be stranded; while for all other commodities and for ship and freight, liability does not attach unless the loss exceed 3 per cent or the ship be stranded. When several successive losses are experienced during the same voyage, the sum of all the losses is the amount considered in determining whether the percentage of loss is high enough to render the underwriters liable.

The measure of the liability of the insurer for particular average on the ship is the cost of repairs, including all extra expenses which they involve, with a deduction, usually of one-third, from the value of new material used in repairing the ship; in the case of freight it is the amount actually lost through the diminution in the weight of the cargo; and for the cargo it is that part of the invoice value of the damaged goods which remains after there has been subtracted from their total value such a proportion

of the total value as the gross value of the damaged goods at the port of destination is of the gross value of similar goods in a sound condition.

General Average. In the absence of insurance general average would be apportioned among all the owners of ship, cargo, and freight. Each party, including the one whose property was sacrificed, would make contribution in proportion to the value of the property he had at stake. In estimating that value the value of ship and cargo is usually taken at their actual value when they reach their destination, while the value of the freight is ascertained by subtracting the wages of captain and crew from the gross amount received as freight. When the different parties are insured, general average is paid by the underwriters and not by the owners of the property. So far as general average is concerned, insurance is a transfer from owners to underwriters of liability for contributions to reimburse those whose property has been sacrificed for the general good.

Sue and Labor. When loss or disaster threatens a ship or cargo, the master of the vessel is bound to do everything in his power to avoid the danger or avert the loss. Whatever expense is incurred for that purpose the underwriters are responsible for, under the so-called suing and laboring clause, which reads as follows: "In case of any loss or misfortune, it shall be lawful to the assured, their factors, servants, and assigns, to sue, labor, and travel for, in, or about the defense, safeguard, and recovery of the said goods and merchandise, or ship, or any part thereof, without prejudice to this insurance: to the charges whereof, we, the assurers, will contribute, each one according to the rate and quantity of the sum herein insured." While the clause says that the insured "may" so sue and labor, it is the established rule of law that he is bound so to act. The general rule is that, in case of damage or partial loss, the insured is bound to act as a prudent man would act under the circumstances if he were uninsured.

MARINETTE, măr'î-nét'. A city and the county seat of Marinette Co., Wis., 178 miles north of Milwaukee, on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Wisconsin and Michigan railroads (Map: Wisconsin, F 3). It is situated at the

mouth of the Menominee River, on Green Bay, opposite Menominee, Mich., with which it is connected by bridges and by steam and electric trams. Marinette has a fine harbor and carries on an extensive lake commerce, and its good water power and proximity to valuable forests have developed its extensive lumber interests. It is, moreover, growing in favor as a summer resort. There are also large box factories, knitting mills, granite works, several establishments making various cedar products, pail and broom factories, paper and pulp mills, ironworks, and manufactories of steam threshing machines, gloves, cutlery, pianos, cooperage supplies, and gas and traction engines. Settled about 1850, Marinette was incorporated in 1887. The government is administered under a general charter of 1898, which provides for a mayor, elected every two years, and a unicameral council. Pop., 1900, 16,195; 1910, 14,610; 1920, 13,610.

MARINETTI, măr'ê-nét'tè, FRANÇOIS (1878-). A poet, born at Alexandria, Italy, but a resident of France. He founded and directed the international review, *Poesia*, and initiated and became the advocate of a literature of "futurism." Among his works are: *Le roi Bombance* (1905), satirical tragedy; *La conquête des étoiles* (1902; 2d ed., 1908); *La ville charnelle* and *Les dieux s'en vont, d'Annunzio reste* (1908); *Poupées électriques* (1909), a drama; *Mafarka-le-futuriste* (1910); *Le futurisme* (1911), the manifesto of his school; *La bataille de Tripoli* (1912); *Le monoplane du pape* (1914).

MARINI, mà-rē'nè, GIAMBATTISTA (1569-1625). An Italian poet, born at Naples, Oct. 18, 1569, frequently called simply Cavalier Marino. He began the study of jurisprudence, but lived so wildly that his father eventually banished him from home. He was received by the chief admiral of Naples as secretary, but the part he played in connection with an abduction forced him to flee to Rome. There he prospered, and before long (1603) he was able to undertake a journey to Venice to superintend the publication of his verse. Attached to the household of Cardinal Aldobrandini, he traveled with him in Italy and, under his auspices, came into contact with many men of letters of the time. He next won the favor of the ducal ruler of Turin, Charles Emmanuel I, but, as a result of one of his many quarrels growing out of literary jealousies, he was arrested, and upon his release went to Paris, where he won the good graces of Maria de' Medici. He remained in France from 1615 to 1623, and then, returning to Italy, he was everywhere received with extraordinary honor. He died at Naples, March 25, 1625. Before his twentieth year Marini had gained considerable reputation by his *Canzone de' baci*. The first collection of his verse was that of Venice (1602-14), entitled *La lira*, in which there is an erudite imitation of Ovid, Tibullus, Spanish writers, and earlier Italian poets. Not to mention his *Sampogna*, his *Strage degl' innocenti*, his *Gallerie* and minor lyrics, his most noted production is the *Adone* (Venice, 1623), a long poem in octaves, ostensibly on the love of Venus and Adonis, but containing long digressions. What most attracts modern attention in this work is its mannerisms, the excess of imagery, and its overwrought style; with its contemporaries it aroused unbounded admiration, as well as bitter criticism among Marino's enemies. Of these the most venomous was

Tommaso Stigliani, whose *Occhiale* initiated a polemic lasting over half a century. The *Adone* is the most brilliant and most characteristic specimen of the concettistic literature of the Italian seventeenth century. As regards form, it shows the extreme development of the Renaissance theory of ornament as the essence of style; as regards substance, it reflects the sensualistic æstheticism of its time with a genius somewhat similar to that of our contemporary D' Annunzio.

Marino* (Naples, 1898); Croce, *Lirici marinisti* (Bari, 1910); id., *Studi letterari del seicento* (ib., 1911); Thomas, *Gongora et le Gongorisme considérés dans leurs rapports avec le Marinisme* (Paris, 1911).

MARIN INDIANS. See MIWOK STOCK.

MARINO FALIERO, mǎ-rě-nô fǎ-lyǎ-rô. A drama by Byron (1820).

MARINONI, mǎ-rě-nô-ně, HIPPOLYTE (1823-1904). A French inventor, born at Paris. He invented a rotary press which could print 40,000 impressions in an hour and was extensively used, and another which printed polychromes in six colors at the rate of 20,000 an hour, as well as many other improvements in printing. After 1883 he was editor of the *Petit Journal*.

MARIO, mǎ-rě-ô, GIUSEPPE, MARQUIS DI CANDIA (1810-83). An Italian dramatic tenor singer, born at Cagliari, Sardinia. In 1830 he received his commission as officer in the chasseurs Sardes, but abandoned his commission and fled to Paris, where he later secured the appointment of first tenor at the opera. At the same time he adopted the name Mario. After two years' study at the Conservatory he made his debut in 1838 in *Robert le Diable* and achieved the first of a long series of operatic triumphs. From 1845 to 1850 he fulfilled an engagement in Russia and on his return appeared in London, and in 1854 he went to America. In his private life he was known for generosity to struggling artists. His repertoire embraced all the staged operas of Rossini, Bellini, Donizetti, and Verdi. In 1844 he married the singer Grisi. He died in Rome. Consult Judith Gautier, *Le roman d'un grand chanteur* (Paris, 1912).

MARION, mǎ-rí-on or mǎ-r-. A town and the county seat of Perry Co., Ala., 28 miles northwest of Selma, on the Southern Railway (Map: Alabama, B 3). It has the Judson Female Institute (Baptist), opened in 1839; Marion Female Seminary, opened in 1836; Marion Military Institute; the Lincoln Normal School for colored pupils (Congregational); and a Carnegie library. An agricultural country surrounds the town. There are municipally owned water works. Pop., 1900, 1698; 1910, 1834.

MARION. A city and the county seat of Williamson Co., Ill., 114 miles southeast of St. Louis, Mo., on the Illinois Central, the Chicago and Eastern Illinois, the St. Louis, Iron Mountain, and Southern, and the Eldorado, Marion, and Southwestern railroads (Map: Illinois, G 10). It has a trade in grain and live stock, and manufactures of flour, cigars, canvas gloves, shoe machinery, novelties, etc. In the vicinity are fine timber lands and deposits of coal, the mining of which constitutes the leading industry. Pop., 1900, 2510; 1910, 7093.

MARION. A city and the county seat of Grant Co., Ind., on the Mississinewa River, 68 miles (direct) northeast of Indianapolis, on

the Cleveland, Cincinnati, Chicago, and St. Louis, the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Toledo, St. Louis, and Western, and the Chesapeake and Ohio of Indiana railroads (Map: Indiana, F 3). Interurban electric lines connect the city with Indianapolis and other cities and towns. Marion has a Federal building, fine courthouse, a large normal college, hospital, and Carnegie library. A National Soldiers Home, which cost \$1,500,000, is 3 miles to the south. The city is the centre of a farming region and has a supply of natural gas. There are extensive manufactories of glass products; also flouring, saw and planing, linseed-oil, and pulp and paper mills; foundries, cornice and brick works; and manufactories of bedsteads, motor trucks, railway supplies, furniture, cement posts and blocks, forgings, engines and boilers, paper-mill machinery, shoes, and gasoline motors. The government is vested in a mayor, elected every four years, and a unicameral council. Marion owns and operates its water works. Pop., 1900, 17,337; 1910, 19,359; 1914 (U. S. est.), 19,656; 1920, 23,747.

MARION. A city and the county seat of Linn Co., Iowa, 5 miles northeast of Cedar Rapids, at the junction of divisions of the Chicago, Milwaukee, and St. Paul Railroad (Map: Iowa, F 2). It is situated in a fertile agricultural country, is a healthful residential city, and has the county buildings, a Carnegie library, sulphur springs, a park in the centre of the city, and a septic sewer system. There are large freight yards and repair shops of the Chicago, Milwaukee, and St. Paul Railroad; also a flouring mill, a broom factory, cement block and vault works, and two greenhouses. Marion was settled in 1839 and was incorporated in 1852. Pop., 1900, 4102; 1910, 4400.

MARION. A city and the county seat of Marion Co., Ohio, 46 miles north of Columbus, on the Hocking Valley, the Cleveland, Cincinnati, Chicago, and St. Louis, the Pennsylvania, and the Erie railroads (Map: Ohio, D 4). There are division headquarters of the Erie Railroad, a Carnegie library, a normal school, the Marion County Children's Home, Old Ladies Home, Elks Home, and a fine Federal building. Marion is the centre of a farming district and has lime works, malleable iron works, silk mills, a piano factory, and manufactories of engines, steam shovels, dredges, shoes, agricultural machines, racing sulkies, etc. Pop., 1900, 11,862; 1910, 18,232; 1914 (U. S. est.), 22,032; 1920, 27,891.

MARION. A city and the county seat of Marion Co., S. C., 103 miles east of Columbia, on the Atlantic Coast and the Raleigh and Charleston railroads (Map: South Carolina, E 2). It is in a fertile region interested chiefly in cotton and tobacco growing and has cotton and cottonseed-oil mills, a foundry, large lumber mills, etc. There is a Carnegie library and a well-kept city park. Pop., 1900, 1831; 1910, 3844.

MARION. A city and the county seat of Smyth Co., Va., 107 miles west by south of Roanoke, on the Norfolk and Western Railroad, at the terminus of the Marion and Rye Valley Railway (Map: Virginia, C 5). It is the seat of the Southwestern State Hospital for the Insane, accommodating about 700 inmates, and of the Marion Female College (Lutheran). The principal industries are woodworking, milling, mining, and stone quarrying. Settled in 1832, Marion was first incorporated in 1871. The

town has its own water supply, obtained by the gravity system from springs which are about 3 miles distant. Pop., 1900, 2045; 1910, 2727.

MARION, FRANCIS (1732-95). An American soldier. He was born at Winyah, near Georgetown, S. C., in which neighborhood his grandfather, a Huguenot refugee, had settled soon after the revocation of the Edict of Nantes in 1685. In 1759 he removed to Pond Bluff, near Eutaw. In 1775 he represented St. John's Parish, Berkeley County, in the Provincial Congress, which adopted the Bill of Rights, and voted to raise forces after the battle of Lexington. He was commissioned a captain in Colonel Moultrie's regiment June 21 and took part in the occupation of Fort Johnson, which caused the flight of the royal Governor, Lord William Campbell. After his promotion to major, in 1776, he was stationed at the unfinished Fort Sullivan (afterward called Fort Moultrie), in Charleston harbor. He showed great coolness during Sir Peter Parker's bombardment, June 28, 1776, and was made lieutenant colonel in the regular service. For a time he was in command of Fort Moultrie, and then took part in the unsuccessful attack of D'Estaing and Lincoln on Savannah in 1779. When the British captured Charleston in 1780 and began to overrun the State, Marion fled to North Carolina, where he met General Gates, who received him coldly. Soon he was asked to command four companies of irregular cavalry, which had been raised around Williamsburg, S. C., and in August, 1780, Governor Rutledge gave him a commission as brigadier general of State troops. His irregular force was ill-equipped and ill-fed, yet Marion demonstrated himself the greatest of partisan leaders, in spite of many obstacles and disadvantages. After the defeat of Gates at Camden and of Sumter at Fishing Creek, this was for a time the only American force of any strength in the State. The men furnished their own equipment and came and went almost at will, as it was necessary to protect their families from the Tories and to plant their crops.

The first important action was on Aug. 2, 1780, at Nelson's Ferry, where two companies of British regulars were routed and 150 Continental soldiers taken at Camden were recaptured. Marion's men caused much trouble to Cornwallis by intercepting communications, capturing foraging and scouting parties, and intimidating the Tories. Major Wemyss and Colonel Tarleton were especially instructed to take him. For a time Marion was forced to retreat towards North Carolina, but in 1781 he established himself at the confluence of Lynch's Creek and the Pedee River, in a swampy forest known as Snow's Island. He took Fort Watson in conjunction with Col. Henry Lee, captured Fort Motte and Georgetown, fought at Quinby's Bridge and Parker's Ferry and at Eutaw Springs. The force was not disbanded until after the British evacuation, in December, 1782. In June, 1782, Marion put down a Loyalist uprising on the banks of the Pedee River, and in August he left his brigade and returned to his plantation. Marion was elected to the General Assembly in 1782 and was publicly thanked by that body in 1783. As he had been impoverished by the war, the sinecure of commandant of Fort Johnson was created for him with a salary of £500 per annum. After his marriage to a wealthy woman, Mary Videau, he represented St. John's in the State Senate and in the Con-

stitutional Convention of 1790. Consult: Sir Banestra Tarleton, *History of the Campaigns of 1780-1781 in the Southern Provinces of North America* (Dublin, 1787); Horry and Weems, *Life of General Francis Marion* (Philadelphia, 1852); W. G. Simms, *Life of Francis Marion* (ib., 1860); Edward McCrady, *History of South Carolina in the Revolution* (New York, 1901-02); and a "Study of Marion's Ancestry and Early Life," in *Southern and Western Monthly Magazine and Review*, vols. i, ii (Charleston, 1845).

MARION DELORME, mǎ'rê-ôn' de-lôrm'. A drama by Victor Hugo (1831), based on the life of the notorious courtesan of that name. She appears in De Vigny's *Cinq-Mars* and in Bulwer's *Richelieu*.

MARIONETTE, mǎr'i-ô-nět' (from It. *mario*, a fool or buffoon, or possibly from *mariolette*, meaning a diminutive figure of the Virgin Mary). A small, jointed figure, representing a character in the miniature drama of a puppet theatre. See PUPPET.

MARIOTTE, mǎ'rê-ôt', EDME (c.1620-84). A distinguished French natural philosopher. He was born in Burgundy and was the prior of St. Martin-sous-Beaune, near Dijon. He was active in developing experimental research in France and was one of the first members of the Académie des Sciences, founded in 1666. He repeated Pascal's experiments on gravitation and detected some peculiarities which had escaped that philosopher; confirmed Galileo's theory of motion; discovered through experiment an approximate formula for determining heights by the barometer; enriched hydraulics with a multitude of discoveries; and finally made a thorough investigation into the subject of the conduction of water and calculated the strength necessary for pipes under different circumstances. His collected works were published at Leyden in 1717 and at The Hague (2 vols., 4to) in 1740. His *Traité du mouvement des eaux* was published at Paris in 1686. Mariotte's name is associated with the law of gases discovered 14 years previously by Robert Boyle, this law being always known in France as Mariotte's law. It was published in a treatise, *Sur la nature de l'air* (1676). It is, in substance, that the volume of a gas varies inversely as the pressure it is under.

MARIOTTE'S LAW, usually referred to as the law of Boyle and Mariotte. See BOYLE'S LAW; GASES, GENERAL PROPERTIES OF.

MARIPOSA (Sp., butterfly). A local name in California for the opah (q.v.).

MARIPOSA GROVE. A tract of land 4 square miles in extent in Mariposa Co., Cal., containing two groves of the *Sequoia gigantea*, consisting of about 465 fine specimens. The largest of the trees, the Grizzly Giant, has a circumference of 94 feet, and its main limb, at a height of 200 feet, is 6½ feet in diameter. The road between the groves passes through an opening 9½ feet wide, cut through the heart of one of the trees. The tallest tree is 272 feet high, and a number exceed 250 feet. The tract is reserved as a State park.

MARIPOSA LILY. See CALOCHORTUS; LILIACEAE and Plate.

MARIPO'SAN, or YOKUT. A linguistic stock or family of North American Indians, formerly located in southern California, about Tulare Lake, and extending as far north as the junction of the Fresno with the San Joaquin.

Twenty-four subtribes are mentioned by Powell. Of these there survive: Choinimni, Chookiminah, Chukchansi, Kashowoo, Tachi, Wechikht, Wikchamni, Yokuts, and Yowdanchi, 533 individuals in all. Every village consisted of a single row of wedge-shaped huts of tule, with an awning of brush stretched along the front. These houses were used for sleeping purposes only. The mountainous condition of the country was naturally productive of a series of isolated areas, in which each camp with its separate captain and medicine man resided. The main sources of their food supply were fishing, hunting, and gathering acorns. Their weapons were sinew-backed bows and excellent arrows. There are no more delicate and beautiful baskets made anywhere than in the villages of this stock, and specimens are to be seen in every fine collection, together with fish weirs, fishing booths, fish traps, and tule boats. Consult Stephen Powers, *Contributions to North American Ethnology*, vol. iii (Washington, 1877), and J. W. Powell, *Seventh Annual Report of the Bureau of Ethnology* (ib., 1891).

MARIQUINA, mǎ'rê-kě'ná. A town of Luzon, Philippines, in the Province of Rizal. It is situated 7 miles northeast of Manila, at the intersection of several important roads, and has manufactures of shoes and other leather work. In the neighborhood are the medicinal iron springs of Chorillo. Pop., 1903, 8187.

MARIS, mǎ'ris. The brothers JACOB, MATTHIJS, and WILLEM, three of the most distinguished among modern Dutch painters. JACOB (1837-99), the eldest, was born at The Hague, studied under Stroebel, Van Hooc, and at the Antwerp Academy, also for a short time under Hébert in Paris. After his return from France he lived chiefly at The Hague. His art is essentially Dutch, owing most to Vermeer and Rembrandt; it is purely pictorial, powerful yet graceful. The color is soft, lucid, and delicately harmonious. His subjects are usually views of Dutch cities, canals, windmills, and the seashore. Twenty-four pictures by him, including the admirable "View of a Dutch Town" and "The Shell Gatherers," are in the Rijks Museum, Amsterdam. There is also a beautiful "View of a Village" in the Dordrecht Museum. Other fine landscapes are "The Bridge" (Frick collection, New York) and "Canal in Holland" (Metropolitan Museum, New York). Good examples of his figure paintings are the "Young Mother" (Rijks Museum) and "The Bird Cage."

His younger brother, MATTHIJS (Matthew) (1839-), was also born at The Hague, studied there at the Academy under Louis Meijer and at the Antwerp Academy. He followed his brother to Paris in 1869, but after 1872 lived chiefly in London. Possessed of a romantic imagination strongly tinged with mysticism, he lived the life of a recluse, painting in a vague, mysterious, yet intensely personal manner. His art is characterized by purity of line and charm of color. His type of woman is unique—monumental yet childlike, mysterious yet intensely living. Among his most celebrated paintings are "The Bride" and the "Cake Baker," both in the Mesdag collection, The Hague; "Butterflies"; "Primavera"; "Siska"; "In the Slums"; and "Revery" (Metropolitan Museum, New York). His landscapes include "Souvenir of Amsterdam," "The Four Windmills," and "Lausanne." His etchings and drawings are no less individual and charming than his paintings.

WILLEM (1844-1910) was almost equally as distinguished in landscape and cattle painting as his elder brothers, under whom he studied. His work is brighter and warmer in color but less virile and varied than Jacob's. He delights in gray-green tones, rich landscapes with sunlight effects. His subjects are usually landscapes with gleaming water, in which are cows or ducks, although he sometimes paints pure landscapes. The collection of James G. Shepard, in New York, possesses five of such paintings; the Rijks Museum, Amsterdam, six. The Shepard collection also possesses a like number of paintings by each of his brothers. Consult: Eduard Rooses, *Dutch Painters of the Nineteenth Century*, vols. ii and iv (London, 1898-1901); D. C. Thomson, *The Brothers Maris* (New York, 1907); Marius, *Dutch Painting of the Nineteenth Century*, English translation (London, 1908).

MARISMAS DEL GUADALQUIVIR, mǎ-rê'smās dël gwǎ'dál-ké-vêr', MARQUES DE LAS. See AGUADO, ALEJANDRO MARÍA.

MARISTS, mǎ'rist's, and **MARIANISTS**, mǎ'ri-an-ists (Neo-Lat. *Marista*, from Lat. *Maria*, Mary). The Society of Marists was founded by the venerable Jean Claude Marie Colin (born 1790 and died 1875), who obtained canonical approbation for his society from Gregory XVI in 1836 and was Superior General from 1836 to 1854. Many missionary houses and colleges were established in France and all Oceania was put under the care of the fathers. A province was erected in the United States in 1889, where they have, according to the official Catholic Directory of 1915, 123 priests, 36 scholastics and novices, 50 aspirants, 21 parishes, and 4 colleges. The *Marianists*, a distinct community, was begun in 1817 in France by William Joseph Chaminade, born in 1761. His society was approved by Leo XIII in 1891. The order has increased rapidly and expanded widely. They are to be found in Belgium and in many other European countries, as well as in China, Japan, Mexico, Canada, and the United States, where since their entrance in 1849 they have more than 50 establishments, including colleges, normal and parochial schools.

MARITANA, mǎ'rê-tü'ná. An opera by Wallace (q.v.), first produced in London, Nov. 15, 1845; in the United States, May 4, 1848 (New York).

MARITIME LAW (Lat. *maritimus*, relating to the sea, from Lat. *mare*, sea). In its broadest sense, that system of law, both public and private, which relates to commerce and navigation upon the high seas or other navigable waters. The sources of the law of the sea as now applied in England and the United States are more ancient and perhaps more complex than those of any other branch of our law. Some of its doctrines, as the law of general average, are traceable to the Rhodian laws, dating back to the eighth century B.C., from which they were adopted into the civil law of Rome, and by it spread over modern Europe. Many of its doctrines may be attributed to customs established by the revival of trade in the countries bordering the Mediterranean and in southwestern Europe in the thirteenth and fourteenth centuries. During this period the commercial states and cities began the compilation of the usages and customs of sea commerce and the judgments of the various maritime courts. The earliest of these is the *Consolato del mare* (q.v.). A later compilation, having even greater influence upon

English law, was that known as the laws of Oléron. (See OLÉRON.) The laws of Wisby, a compilation of mercantile customs and usages adopted by a congress of merchants at Wisby in the island of Gotland in the Baltic Sea, about 1288, which became the basis of the ordinances of the Hanseatic League, were also of great influence in the development of the modern laws of the sea; as were also the Hanseatic ordinances and the French marine ordinance, promulgated by Louis XIV in 1681, by which the whole law of shipping, navigation, marine insurance, bottomry, etc., was collected and systematized. The local ordinances of Barcelona, Florence, Amsterdam, Antwerp, Copenhagen, and Königsberg were also not without influence.

The earliest English compilation of maritime law appears to have been the Black Book of the Admiralty, supposed to have been published during the reign of Edward III. It was based substantially upon the laws of Oléron. The British Parliament has never passed general maritime ordinances, but the maritime law drawn from the sources here indicated has been embodied in a series of decisions of the courts of admiralty jurisdiction, which, with the decisions of our own Federal courts rendered since the American Revolution, constitute the maritime law of the United States.

Maritime law is administered in England by the courts of admiralty; in the United States by the Federal courts, which, by the Constitution, have jurisdiction over all causes in admiralty. This jurisdiction of the Federal courts is not, however, exclusive, and a suitor may seek his remedy at common law in the State courts wherever the common law is competent to give a remedy. In England maritime causes are said to be those which directly affect commerce or navigation upon waters in which the tide ebbs and flows. In the United States, where the conditions are different, maritime causes are deemed to be those directly affecting commerce upon navigable waters which in themselves or by means of other waterways form a continuous highway to foreign countries. Hence the fact that commerce in a given case is carried on only upon waters within a single State does not necessarily affect jurisdiction of the Federal courts, and such jurisdiction is not dependent upon the constitutional power of Congress to regulate commerce. As maritime jurisdiction depends upon the subject matter and not the parties, a United States court may take jurisdiction over a maritime cause arising in a foreign vessel between foreigners. The exercise of jurisdiction over foreigners is, however, purely discretionary, and may be refused; and it is a general principle that a maritime court will not take jurisdiction over a ship of war of a friendly foreign nation.

Liability for torts, or common-law wrongs, is recognized and enforced by the maritime law. Maritime torts include all wrongful acts or direct injuries arising in connection with commerce and navigation occurring upon the seas or other navigable waters, including negligence and the wrongful taking of property. The maritime law, however, regards only actual damages and allows no recovery for merely nominal injury. The test for determining whether a tort is of a maritime nature is the locality where the tortious act is consummated or takes effect. Thus, an injury to a bridge or wharf by a ship, inasmuch as the injury is effected upon land, is not within the jurisdiction of the admiralty

court, but an injury to a ship by a drawbridge is a maritime tort, of which the admiralty court has jurisdiction. The maritime like the common law does not recognize a right of recovery for wrongful death, but a statute may confer the right, which will then be recognized in admiralty in accordance with the settled principle that both the Federal courts of admiralty and of equity will provide a remedy for new substantive rights created by State statute. Such statutes have been enacted both in England and the United States. See COLLISIONS OF VESSELS; BOUNTY; BARRATRY.

The maritime law also recognizes and enforces contracts by awarding damages or enforcing liens which it recognizes as created on the basis of contract. In general the essential elements of a contract are the same under the maritime as at the common law. The maritime law differs from the common law only in the method by which it may enforce the contract and in attaching to the various classes of contracts certain legal incidents peculiar to each class. A contract is deemed to be of a maritime nature so as to be within the jurisdiction of an admiralty court when in its essence it is purely maritime, relating to commerce and navigation upon navigable waters as already defined, as contracts for the betterment of a vessel in aid of navigation or for the sustenance and relief of those engaged in conducting commercial operations at sea. Thus a contract of partnership in a vessel is not a maritime contract, neither is a contract to build a vessel, nor is a preliminary agreement leading to a maritime contract, as a contract to procure marine insurance, within the jurisdiction of the admiralty court. For a fuller discussion of the various forms of maritime contracts and their incidents, see such special articles as BOTTOMRY BOND; RESPONDENTIA; CHARTER PARTY; AFFREIGHTMENT; MARINE INSURANCE; SALVAGE; WHARFAGE; DEMURRAGE.

The jurisdiction of maritime courts also extends to all prize causes growing out of captures of vessels, of ships of war or privateers, made upon navigable water, or started there, although consummated on land. In England the law of prize is administered in a separate department of the admiralty court, as distinguished from the instance court in admiralty. In the United States no distinction is made between prize and other admiralty causes, all being within the jurisdiction of the district courts of the United States. By act of Congress captures made upon inland waters of the United States are deemed not to be prizes, and consequently are not within the admiralty jurisdiction of the United States courts. See PRIZE; INTERNATIONAL LAW.

The adjustment of the rights of the parties to a maritime venture in accordance with the principles of general average is also an important function of maritime courts, and the doctrines of general average are among the most important of the maritime law. (See MARINE INSURANCE, *Average*.) The English admiralty courts have by statute acquired jurisdiction over crimes committed on the high seas outside the marine league. Similar jurisdiction has by act of Congress been conferred on the United States district courts.

The peculiarities of maritime law and the character of the jurisdiction exercised by maritime courts are best illustrated by the law relating to maritime liens, which are enforced by proceedings in rem. A maritime contract may

give rise to a maritime lien when made for the benefit or assistance of a marine venture, and when made on the credit of the vessel rather than on the credit of the owner or charterer. There is a presumption that all contracts for necessary supplies and repairs to a vessel are made on the credit of the owner if in a home port, but upon the credit of the vessel if in a foreign port. The seamen and subordinate officers, but not the master of the ship, have a lien upon the ship for wages due. The marine carriers also have a lien for freight and demurrage.

Analogous to the contract lien, although strictly not based on contract, is the lien which any party to a maritime venture who has made a general average sacrifice has upon vessel or cargo, or both, to secure contribution in general average. Maritime liens may also arise *ex delicto* for all wrongs or injuries caused by the ship, or by collision, or by failure of the ship as a common carrier to carry or deliver goods safely.

It is a general principle of the maritime law that the master has the power, when necessity arises and he is unable to communicate with the owners, to sell both ship and cargo and confer a valid title on the purchaser to sell free of liens, which then attach to the proceeds. Lienors do not share pro rata in the subject of the liens, but have priority according to their importance as contributing to the safety or preservation of the property. Thus, as between different voyages, liens have priority in the inverse order of their creation. In the same voyage the order of priority is as follows: (1) costs of litigation; (2) salvage; (3) salary of seamen, cost of supplies and repairs, bottomry and respondentia, pilotage and towage.

The procedure of maritime law is extremely simple, never having been characterized by complex and technical rules, as was the procedure at common law. The most distinguishing characteristic is the power of the plaintiff to make the proceeding purely one in rem, i.e., one directed solely towards the property which the plaintiff wishes to subject to the maritime lien which he claims. The procedure may, however, at the plaintiff's option, be an action in personam, i.e., one in pursuance of which a personal judgment may be recovered against the master or owner; or, in the absence of rules of court to the contrary, it may be both in rem and in personam. The proceeding in admiralty is begun by filing a libel (q.v.) corresponding to the declaration or complaint in a common-law action. Upon filing of the libel the court issues its writ or mesne process, which is executed by the marshal or corresponding officer by attaching the *res*, i.e., the ship or cargo, if the proceeding is in rem, or by citing the respondent to appear and answer, if the proceeding is in personam. The respondent is then required to file his answer, or he may file exceptions, which correspond to the demurrer in an action at law. The issues raised are laid before a judge without a jury, or, as is more usually done, the testimony in the case is taken before a commissioner or corresponding officer, who reports it to the judge. The judge does not usually assess damages, but refers that question to a commissioner by an interlocutory judgment, and upon the commissioner's report renders a final judgment fixing the rights of the parties.

MARITIME PROVINCE (Russ. *Primorskaya Oblast*). A name given to the former Province of Primorskaya, which extends from the Arctic Ocean, where it reaches as far west as Tchaun Bay, to the north boundary of Korea. Its west boundary runs along the Stanovoi Mountains to about long. 130° E., then southeast and south to the Amur (which traverses the province in a northeasterly direction), then along the Usuri, which forms part of the boundary of Manchuria, and finally southwest to the Korean border, along the east frontier of Manchuria to Korea (Map: Asia, O 3). Its area is made up of the provinces of Kamchatka (q.v.) (502,424 square miles), Sakhalin (14,668 square miles), and Primorskaya (226,486 square miles). The northern portion, forming the northeast extremity of Asia, is a barren plateau from 1000 to 2000 feet in elevation and watered by the Anadyr and many other rivers. Its coasts are deeply indented and present a number of promontories towards Bering Strait and Bering Sea. The plateau is bordered on the north by mountains which rise to 8000 feet. The central part of the province is a narrow strip of land, 40 to 60 miles wide, along the Sea of Okhotsk, occupied by the Stanovoi Mountains and intersected by numerous short streams.

The southern part is somewhat lower west of the Amur, while the portion east of that river is occupied to some extent by the mountainous district of Sikhota Alin, rising above 5000 feet in its highest peaks. The flora of the northern part is extremely poor, consisting only of some lichens, mosses, and dwarf trees. The lower mountain slopes of the central portion of the province and the deep river valleys are thickly wooded. The same is true of the mountains in the southern part, where the lowlands are covered with thick grass, and some plants peculiar to warmer regions, such as the wild vine, are found. Northern Siberia has long been famous for its rich fauna, but many species, such as the blue fox, the black sable, the sea otter, the sea lion, the sea cow, and the whale, have either entirely disappeared or are rapidly approaching extinction. The fauna of the southern region is remarkable for its variety, including such different species as the tiger and the bear. The rivers in this part of the country are exceedingly rich in fish, the Amur and the Usuri being filled with salmon in August, and it is along their banks that the population of the province is concentrated. The northern part of the province is inhabited chiefly by the Tchukches, who are engaged in fishing on the coast and in reindeer breeding and hunting in the interior. Besides the Tchukches there are found some Koryaks on the coast. The central part of the province is inhabited only by a few Tunguses.

The climate presents great variety, owing to

the large extent of the region, but even in the south it is very severe. The temperature at Vladivostok, at the southern end of the province, averages only 39.5° F., while at Nikolayevsk, at the mouth of the Amur, it is below the freezing point. The summers in the southern part are extremely wet, and inundations are frequent.

Agriculture is confined by natural conditions to the southern portion of the province and is progressing very slowly. Hunting and fishing are still the chief occupations. Some gold is produced along the Amur. Immigration has made wonderful strides since the beginning of the twentieth century, as the population figures show. This is due chiefly to the Trans-Siberian Railway, which was completed in 1898. Many Little Russian peasants and Cossacks from the Don territory and Orenburg have been transported to the province by the government. Roads are very scarce, but a branch of the Trans-Siberian line traverses the province from Khabarovsk to Vladivostok for a distance of 469 miles. Nikolskoye, 69 miles north of Vladivostok, is the eastern terminal of the Manchurian branch of the Trans-Siberian line. The population in 1897 was 223,336, including about 45,000 natives, more than 23,000 Koreans, and over 29,000 Chinese; in 1912 the population was 572,000, the density per square mile being 2. The Russians constitute over one-half of the entire population. The original Russian population are organized on a military basis, and are known as Cossacks. The capital of the province is Khabarovsk (q.v.), but the most important town is Vladivostok (q.v.).

MARITZA, mā-rĕ'tsā (Lat. *Hebrus*). A river of the Balkan Peninsula (Map: Balkan Peninsula, F 4). It rises in the Balkans in Bulgaria, flows southeast through eastern Rumelia past the town of Philippopolis, and continues in that direction until it enters Turkey above Adrianople, where it bends south and falls into the Ægean Sea near its northeast corner. It is 300 miles in length, and is navigable for small boats to Adrianople, about 100 miles from its mouth. The treaty of Sept. 18, 1913, between Bulgaria and Turkey makes the lower reaches of the river below Mandra the new frontier.

MARIUPOL, mā-rĕ-ōō'pōl-y'. The capital of a district of the same name in the Government of Ekaterinoslav, Russia, situated on the north shore of the Sea of Azov, 63 miles west of Taganrog (Map: Russia, E 5). It has two Gymnasias, a theatre, and a customhouse. Soap and leather are its chief manufactures; it carries on a considerable trade in grain. Its harbor is visited annually by over 1300 coasting and about 100 seagoing vessels. Mariupol was founded in 1779 by Greek emigrants from the Crimea. Pop., 1911, 53,100, chiefly Greeks and Jews.

MA'RIUS, GAIUS (c.156-86 B.C.). A Roman general, born of an obscure family of the *Maria* gens, at the village of Cereatē (modern *Casamare*), near Arpinum, about 156 B.C. (See *ISOLA DEL LIBRI*.) In the Numantine War (134-133 B.C.) he served with great distinction under the younger Scipio Africanus. In 119 B.C. he was elected tribune of the plebs, and vigorously opposed the nobles, by whom he was intensely hated. He acquired social standing and political influence by his marriage with Julia, aunt of Julius Cæsar. In 114 B.C. he went to Further Spain as proprætor, and cleared the country of the robbers who infested it. He accompanied Q. Cæcilius Metellus Numidicus to Africa in 109 B.C.,

was elected consul two years after, and intrusted with the conduct of the Jugurthine War, which he brought to a successful close in the beginning of 106 B.C. Marius sent Sulla, then his quæstor, to receive Jugurtha, and this laid the foundation of future personal enmity. Numidia Marius thoroughly subdued and annexed to Rome. The military success of Marius had now made him the most conspicuous officer in the Roman army, while he had aroused enthusiastic admiration among his soldiers. Meanwhile an immense horde of Cimbri, Teutones, and other northern barbarians had burst into Gaul and repeatedly defeated the Roman forces with great slaughter. In consequence Marius was again called to the consulate for the year 104 B.C., and for the third, fourth, and fifth times in 103-101 B.C., for it was felt that he alone could save the Republic. The war against the Teutones in Transalpine Gaul occupied him for more than two years; but he finally annihilated them in a battle of two days' duration at Aquæ Sextiæ, now Aix, in Provence, where 200,000—according to others, 100,000—Teutones were slain. After this he assumed the chief command in the north of Italy against the Cimbri (q.v.), whom he overthrew on the Raudian Fields, near Verellæ, with a like destruction (101 B.C.). The people of Rome knew no bounds to their joy. Marius was declared the savior of the state, the third founder of Rome, and his name was mentioned along with those of the gods at banquets. He was made consul for the sixth time in 100 B.C. In the next 10 years, however, his prestige waned, particularly because of his association with Saturninus (q.v.). In the Social War (q.v.) he twice defeated the Marsi. When Sulla, as consul, was intrusted with the conduct of the Mithridatic War, Marius, who had long manifested an insane jealousy of his patrician rival, and was himself an aspirant for the command of this war, attempted to deprive him of the command, and a civil war began (88 B.C.). By procuring a new organization of the Roman tribes, through passage of a law to distribute the Italian allies among all the tribes, Marius secured an election to the command of the war. Sulla fled to his army at Nola, refused to resign the command, and marched on Rome. Marius was soon forced to flee, and after enduring the greatest hardships, and making numerous hairbreadth escapes, he reached Africa, where he remained until a rising of his friends took place under Cinna (q.v.). He then hurried back to Italy, in the absence of Sulla, and, along with Cinna, marched against Rome, which was obliged to yield. Marius was delirious in his revenge upon the aristocracy; a band of 4000 slaves is said to have carried on the work of murder for five days and nights. Marius and Cinna were elected consuls together for the year 86 B.C. Marius was, however, already in his seventy-first year, and died after he had held office only 17 days.

Unlettered, arrogant, and rude of manner, Marius did not possess the qualifications requisite for maintaining influence in times of peace. The effect of his personal presence is illustrated by the scene when, during his flight to southern Italy, near Minturnæ, a barbarian entered his room with drawn sword to assassinate him. When Marius called out, "Man, durst thou murder Gaius Marius?" the intruder, awed by the fiery eyes of Marius, dropped his sword in terror and fled. Consult: Beesly, *Marius and Sulla*

(New York, 1878), and the article "Marius I," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MARIUS, MERCATOR (c.390-c.451). An ecclesiastical writer of the earlier half of the fifth century, born in Africa. He was living in Rome, 418, and 10 years afterward in Constantinople, where he stayed until about 448, but authorities differ as to whether he was priest or layman. He is known to have been a friend and defender of Augustine, a denouncer of the Pelagian and Nestorian doctrine. His determined opposition to the promulgators of these heresies bore fruit in their expulsion from Constantinople. He made Latin translations of Nestorius, Theodosius of Mopsuestia, Cyril of Alexandria, Proclus, Theodoret, Pelagius, and other Greeks which are invaluable to students of Church history. These, together with his own controversial writings, were twice edited in Paris—in 1673 by Garnier and in 1684 by Baluze.

MARIVAUX, mǎ'rě'vô', **PIERRE CARLET DE CHAMBLAIN DE** (1688-1763). A French dramatist important in the development of French comedy, and a novelist, epoch-making in the evolution of French fiction. He was born in Paris, Feb. 4, 1688. His father was a Norman, director of the Mint at Riom in Auvergne, where and at Limoges Marivaux passed his youth. His literary taste developed early. At 18 he had written a play, *Le père prudent et équitable* (published 1712), and between 1713 and 1715 he produced three romances, *Effets surprenants de la sympathie*, *La voiture embourbie*, and *Le Don Quichote moderne*, all wholly out of key with his later work. Then, falling under the influence of the parodist La Motte, he undertook to travesty Homer and Fénelon, but turned from this ignoble task to the production of essays in the vein of the *Spectator* for the journal *Le Mercure* (1717). These showed keenness, but also preciosity. The year 1720 marks a turning point in Marivaux's genius and fortune. He lost his considerable wealth in the Mississippi Scheme, became dependent on his pen, wrote a poor tragedy, *Annibal*, and a good comedy, *Arlequin poli par l'amour*, and started the *Spectateur Français*, a weekly "Spectator," that might have succeeded if his unmethodical habits had allowed it to appear regularly. For the next 20 years he supported himself as a playwright, succeeding in comedy at the Italian Theatre and failing in tragedy at the Théâtre-Français. The more noteworthy of his 30 plays are: *Les surprises de l'amour* (1722); *Le triomphe de Plutus* (1728); *Le jeu de l'amour et du hasard* (1730); *Le legs* (1736); and *Les fausses confidences* (1737). He founded two other unsuccessful journals, and in 1731 began the publication of a novel, *Marianne*, which he left incomplete at its eleventh part in 1742. Madame Riccoboni finished it. In 1735 he began *Le paysan parvenu*, which also remained a torso. Yet these are his most important works. In 1736 he was elected to the Academy. Late in life he received a pension from Helvétius (q.v.) and another from Madame de Pompadour (q.v.). He died Feb. 12, 1763. Marivaux shows himself in his dramas and in his fiction interested primarily in the analysis and display of human feeling. He drew in both his novels pictures of contemporary society and of Parisian street life that remained unequalled for a century in their impressionistic realism, but his delight is in verbal surprise—a somewhat affected style known

in French literature as *marivaudage*. Marivaux's Works are in ten volumes (Paris, 1827-30). There is a modern edition of the plays by Fournier and also of *Marianne*.

W. Olmsted (rev. ed., New York, 1911); E. C. Baldwin, "Marivaux's Place in the Development of Character Portrayal," in *Modern Language Association of America, Publication*, vol. xx (Series 8, Cambridge, 1912).

MARJORAM (OF. *marjolaine*, *margelyne*, Fr. *marjolaine*, It. *majorana*, *maggiorana*, from ML. *majoranica*, from Lat. *amaracus*, *amaracum*, from Gk. ἀμάρακος, *amarakos*, ἀμάρακον, *amarakon*, marjoram, probably connected with Heb. *mārag*, to purify; influenced by popular etymology with Lat. *major*, greater), *Origanum*. A genus of annual, perennial, and shrubby plants of the family Labiate, natives chiefly of the East and of the Mediterranean region. Some of the species abound in a yellow essential oil, marjoram oil or oil of origanum, which is obtained by distillation. The common marjoram (*Origanum vulgare*), which has become naturalized in the United States, is a perennial plant, 1 foot high, with ovate leaves and roundish, panicle crowned heads of purple flowers, with large bracts. It is used, as are also other species, as a seasoning in cookery, and is said to be stimulant and tonic. Sweet marjoram (*Origanum majorana*) is an annual plant, a native of Greece and the East, with ovate grayish-green leaves, wrinkled bracts, and small white flowers. Its uses are similar to those of the common marjoram.

MARJORIBANKS, mǎrch'bānks, EDWARD, second BARON TWEEDMOUTH. See TWEEDMOUTH.

MARK, mǎrk (Ger., border, march). A German geographical term, signifying primarily the mark of a country's limits (the *march*), and hence applied as a designation of the border districts of the German Empire. Prussia began its existence as the north mark, erected against the invasion of the Wends, while Austria arose from the east mark, erected against the Hungarians. The governor intrusted with the charge of one of these border districts was called *markgraf*, or *margrave* (q.v.). There has been a long dispute among scholars as to the original meaning of *mark*. On this dispute, consult Maurér, *Geschichte der Markenverfassung in Deutschland* (Erlangen, 1856), and Fustel de Coulanges, *Histoire des institutions politiques de l'ancienne France* (6 vols., Paris, 1888-1908).

MARK (AS. *marc*, Ger. *Mark*; perhaps identical originally with *mark*, token, boundary). Originally the term appears to have been used to designate a unit of weight, most commonly of gold or silver. It was about equal to eight ounces, but it varied from country to country. In 1524 the Cologne mark was made the standard weight for gold and silver throughout the Holy Roman Empire, but the standard was never properly enforced. In Anglo-Saxon times the term "mark" was used to designate a money of

account, consisting of 100 pennies—in the twelfth century, 160 pennies. In 1663 a silver mark was issued in Scotland which was valued at 13s. 1d. English money. In the nineteenth century the mark was a common small coin among the German states, varying considerably in the different parts of Germany. In 1873 the gold mark of 100 pfennige was adopted as the monetary unit of the German Empire. It represents 0.3982 gram of gold (900 fine) and is valued at \$0.23821 in American money.

MARK (Lat. *Marcus*, Gk. *Μάρκος*, *Markos*), or **JOHN**, with the surname **MARK** (Acts xii. 12). The writer of the second Gospel. The incidental notices in the New Testament give the following facts: Mark was the son of a certain Mary, a householder of Jerusalem, at whose home the early Christians held meetings in the days of persecution (Acts xii. 1–12). He was a cousin of Barnabas (Col. iv. 10), hence, possibly, in case the relationship was on the father's side, of Levitical descent. An old tradition says that he had his thumbs cut off so as to be unfit for the priesthood. Peter calls him his "son" (1 Pet. v. 13), which means probably that he was converted to Christianity under Peter's ministry in Jerusalem. He came to Antioch from Jerusalem with Barnabas and Paul (Acts xii. 25), and accompanied them as an assistant on their first missionary journey (Acts xiii. 5). But he left them at Perga and returned to Jerusalem (Acts xiii. 13; cf. xv. 37–39). His action cost him Paul's confidence, and when Barnabas proposed to take him on a second journey Paul refused. The result was a separation, and Barnabas took Mark and went to Cyprus (Acts xv. 37–40). This was about 50 A.D. We hear nothing more of him until Paul's first Roman captivity (c.60 A.D.), when we learn (Col. iv. 10; Philem. 24) that he was then in Rome, reconciled to Paul and esteemed by him, and was about to visit Asia Minor. He may have come to Rome with Peter, who mentions him (1 Pet. v. 13) as with him in the city. The proposed journey to Asia was probably undertaken, as he was in the East when Paul wrote from Rome (c.65) to Timothy at Ephesus (?) asking him to bring Mark with him (2 Tim. iv. 11). At Rome, according to early tradition, he wrote his Gospel, not altogether as his own work, but as containing the substance of Peter's preaching. Another tradition makes him the organizer and first Bishop of the Alexandrian Church. In the nature of the case such traditions are difficult of proof. Consult the commentaries on Mark, especially that of Swete (London, 1898), and Zahn, *Einleitung in das neue Testament*, vol. ii (Leipzig, 1900). See **MARK**, GOSPEL OF.

MARK, EDWARD LAURENS (1847–). An American anatomist, born at Hamlet, N. Y. He graduated at the University of Michigan in 1871 and in 1872–73 acted as assistant astronomer on the United States Northwest Boundary Survey. He then studied zoölogy in Europe under Leuckart, Haeckel, and others, and obtained his Ph.D. at Leipzig in 1876. In 1877 he was appointed instructor at Harvard College, in 1883 assistant professor of zoölogy, in 1885 Hersey professor of anatomy, and in 1900 director of the Zoölogical Laboratory. In 1903 he became director of the Bermuda Biological Station for Research. In 1904 he was elected president of the American Society of Naturalists. His publications include: *Maturation, Fecundation, and Segmentation in Limax campestris* (1881);

Simple Eyes in Arthropods (1887); *Trichinae in Swine* (1889); *Studies on Lepidosteus* (1890); a translation from the German of O. Hertwig, *Text-Book of the Embryology of Man and Mammals* (1892), and a translation of Korschelt and Heider, *Text-Book of the Embryology of Invertebrates* (1895–1900). Consult Parker (ed.), *Mark Anniversary Volume* (New York, 1904).

MARK, GOSPEL OF. The second of the New Testament Gospels. Its first verse opens with a phrase ("The beginning of the gospel of Jesus Christ") that is evidently intended to be a caption for the narrative which follows. The narrative is arranged simply and in an order which, while not always exact, is usually the normal chronological order of the Gospel events. There is first the preliminary history reciting the ministry of John the Baptist and the entrance of Jesus upon his work, through the symbolic act of the baptism and the personal experience of the temptation (i. 2–13). There then follows the main portion of the narrative, which gives, first, Jesus' popular work in Galilee (i. 14–vii. 23) and his similar work in the region north of Galilee (vii. 24–viii. 26), and then breaks in upon this northern work with a presentation of it in the light rather of a work of instruction, chiefly to his disciples, than a work of construction among the people (viii. 27–ix. 29). This new character of Jesus' work is carried on into what may be generally considered his journey towards Jerusalem (ix. 30–x. 52). The event that marks this change is the disciples' confession of Jesus' Messiahship given in the neighborhood of Cæsarea Philippi, which was followed by Jesus' first clear declaration of his coming death (viii. 27–ix. 1). This is evidently considered by the Evangelist as the turning point in Jesus' work, leading him to a change in its character and method. Chapters xi–xiii are given to the final work in Jerusalem, which Mark, in common with the other Evangelists, presents as a work in which Jesus' Messianic claims are openly laid before the nation's religious leaders. The narrative closes, as in all the Gospels, with the Passion and Resurrection (xiv–xvi).

It is universally held that verses 9–20 of the last chapter (xvi) are a later addition to the Gospel, the original ending being generally regarded as lost. Just, how much further the narrative went and whether it included, as Luke alone can be possibly said to do, an account of the Ascension, can only be conjectured.

In comparison with the other Synoptists Mark is quite distinctly the shortest Gospel, considerable portions of the history appearing in Matthew and Luke being absent from Mark—such as the Nativity, the Sermon on the Mount, and that part of Luke which is devoted apparently to a story of Jesus' last journeyings to the Holy City; and yet where Mark gives the narrative in common with the other two he gives it with a fullness of graphic detail which the others do not possess. It is also characteristic of Mark that, though he has an account of the parables by the Sea of Galilee, he does not give the discourses of Jesus in a measure equal to that of Matthew and Luke. In the opinion of most critics this indicates that Mark had not access to, or at least did not make use of, the Logia collection of Matthew, though some hold that he made a moderate use of it. See **MATTHEW**, GOSPEL OF.

It is plain that this Gospel was written by a

Jewish Christian—not because of any Jewish cast of the Gospel, as in the case of Matthew, for such a cast it does not possess—but because (a) of the author's familiarity with Jewish things and his ready ability in explaining them (cf. ii. 18; vii. 3 et seq.; xii. 18; xiv. 12; xv. 6, 42), and (b) because of his acquaintance with the Aramaic language, expressions from which he frequently uses (cf. iii. 17; v. 41; vii. 11, 34; ix. 43; x. 46; xiv. 36; xv. 22, 34). On the other hand, it is clear that the readers were Gentile Christians—not simply because they were unacquainted with Palestinian customs and speech, but because this ignorance seems to be surrounded by a very general Latin atmosphere, as though the readers not merely needed the above interpretations and explanations, but needed them cast in this mold (cf. v. 9; vi. 27, 37; vii. 4; xii. 42; xv. 16, 39). As to the place of the Gospel's origin there is nothing definite to be gathered from the contents, though many modern scholars accept the opinion of Clement that it was written at Rome. The Latin atmosphere would most easily be thrown around the narrative in a Latin country. As to date, 64 to 70 A.D. are limits often suggested; but it is universally admitted that whatever may be the year of its composition, it gives every evidence of being the earliest of all the Gospels. In fact, a comparison of Mark's order of narrative with that of Matthew and Luke shows that Mark's order was that which Matthew and Luke had before them when they wrote. See MATTHEW, GOSPEL OF; LUKE, GOSPEL OF.

Early church writers, almost without exception, ascribe the authorship of this Gospel to Mark (q.v.), the cousin of Barnabas, and to Mark as in some way connected in the writing with Peter. Some of the Fathers, as Jerome and Origen, make the relation of Mark to Peter that of an amanuensis; others, as Eusebius, that of a reporter; others again, as Clement of Alexandria, Justin Martyr, and Irenæus, that simply of a disciple recalling his master's words. The earliest and most explicit testimony, and that which seems to bear upon its face the strongest proof of credibility, is the testimony from Papias, who describes Mark as the interpreter of Peter's preaching, and Mark's Gospel as his conscientious reproduction of what Peter's discourses contained. This testimony of Papias would agree with the original Greek character of the Gospel's composition; for, according to this testimony, the service which Mark rendered to Peter was evidently that of interpreting his Aramaic discourses into the Greek, which his audiences could understand. It would further agree with the fresh and vivid style of the Gospel's narrative; since such immediate contact with Peter's reminiscences as Mark must have had would give the stamp of an eyewitness to all his record. And it would yet further agree with a certain Petrine element which seems to be present at frequent points in the Gospel, since, however Mark may have reconstructed these discourses of Peter, he is not likely to have lost out of them altogether the personal element they must have contained.

Accordingly, the general verdict of criticism is that the second canonical Gospel is from the hand of Mark and in part reproduces Peter's personal knowledge of and participation in the Gospel events. At the same time this verdict attaches only to the substance of the Gospel, since there are clear traces of documentary

sources in the latter part of the Gospel, as in the discourse regarding the future in chap. xi, which could not come from Peter's oral stories. The question also arises whether Mark as we now have it may be an enlarged edition of the original Mark. On this subject there is not a unity of opinion; but, since the enlargement was in any case not great, the question is relatively unimportant.

Naturally in proportion as Mark's Gospel is the reproduction of Peter's preaching, so far must its purpose be a homiletic rather than a purely historical one. This purpose was to show that the deeds of Jesus proved his mission as a messenger from God. It was not so much to tell the story of Jesus' life, as to testify to the impression which Jesus himself had made upon the spiritual experience of his followers.

Bibliography. Burton, *Studies in the Gospel According to Mark* (Chicago, 1904); Burkitt, *The Gospel History and its Transmission* (2d ed., Edinburgh, 1907); B. W. Bacon, *The Beginnings of Gospel Story* (New Haven, 1909).

MARK ANTONY. See ANTONIUS, MARCUS.

MARKBY, märk'bī, SIR WILLIAM (1829–1914). An English jurist, born at Duxford, Cambridgeshire, the son of a clergyman. He was educated at Bury St. Edmunds and at Merton College, Oxford. He became a barrister in 1856 and 10 years later went to Calcutta as judge of the High Court. Upon his return to England in 1878 he was reader in Indian law at Oxford until 1900. He was a commissioner on the administration of justice in Trinidad and Tobago in 1892. Markby was knighted in 1889; 10 years earlier Oxford had made him a D.C.L. An eminent authority on Indian law, he published *Lectures on that subject* and the well-known *Elements of Law Considered with Reference to General Principles of Jurisprudence* (6th ed., 1905).

MARKET. See MARKETING ASSOCIATIONS, AGRICULTURAL.

MARKET BOSWORTH. See BOSWORTH.

MARKET BUILDINGS. From the earliest antiquity it has been the custom to reserve in cities and towns a space where farmers and merchants could exhibit and sell their commodities, and such spaces were sometimes surrounded with porticoes or with public buildings and entered by monumental gates. The gate of the Agora at Athens (c.40 B.C.) is still extant, and the foundations of a circular structure in Pompeii are identified as those of the Macellum (meat market). The Forum Boarium (cattle market) and Forum Olitorium (oil market) in Rome illustrate the practice of providing special places for particular commodities. This prac-

tice still prevails in all large cities, and the names Grassmarket, Haymarket, Piazza dell' Erbe, and the like preserve in many old cities the memory of the original use of the places or squares which bear them. In process of time various types of accessory buildings were developed in association with market places, such as belfries, clock towers, and crosses, usually standing in the centre or at one side of the open space and serving as stands from which proclamations and addresses could be made. Such were the loggias of the Mercato Vecchio and Mercato Nuovo in Florence, the Poultry Cross at Salisbury (England), the Tour de la Vieille Horloge at Rouen (France). A decorative fountain was a frequent feature, especially in Italy and Germany.

The erection of covered buildings provided with permanent stalls to serve the purposes originally met by mere open spaces was not common until late in the eighteenth century. Yet as early as the thirteenth century the grain market of Florence was housed in a massive arcaded building later converted into a church, the Or San Michele, and in the sixteenth century the Shah Abbas surrounded the Meidan-Shah at Ispahan with arcades providing shelter for merchants, while both there and in Constantinople certain streets were covered with vaulted roofs and given over to particular trades—the famous bazars of the Orient. The modern practice is to erect specially designed structures with stalls to be rented to the dealers, and so arranged as to furnish convenient access on the one hand to the supply wagons and on the other to the customers. Ventilation, drainage, water supply and refrigeration are scientifically provided for. The materials of construction are selected with especial reference to durability and cleanliness, and in many cities the markets are under the close supervision either of the health authorities or of a special officer or bureau.

The earliest market buildings were little more than sheds, of more or less architectural design, around a square in which a fountain supplied running water (Marché St. Germain, Paris). In 1811 the Halle au Blé, a circular grain market and exchange, covered by a dome of timber construction over 100 feet in diameter, was burned, and a new dome was built of iron, the earliest metallic roof of large space. In 1846-52 were built the vast Halles Centrales, by Baltard, covering over eight acres, in two blocks, with a lofty central avenue and four intersecting streets. This building, of iron and glass (except the lower part of the walls which is of brick), still admirably fulfills its purpose, and has been a model for other cities to follow. Smithfield Market, London, is another vast market of somewhat later date, of brick and stone, iron and glass, devoted to the wholesale meat trade. Important market buildings exist in nearly all large European cities; those of most American cities are far inferior to these in design and maintenance, and none deserves special mention. The early markets and their buildings were the precursors and prototypes of the modern exhibitions. See METAL WORK IN ARCHITECTURE; EXHIBITIONS, ARCHITECTURE OF.

MARKET CROSS. See CROSS.

MARKETENDERIN, DIE (Ger., The Canteen-Woman). An opera by Humperdinck (q.v.), first produced in Cologne, May 10, 1914.

MARKETING ASSOCIATIONS, AGRICUL-

TURAL (AS. *market*, from Lat. *mercatus*, traffic, market, from *mercari*, to trade, from *merx*, merchandise, from *merere*, to earn, deserve; connected with Gk. *μέρος*, *meros*, share). A market may be defined as a place where goods are bought and sold. A market may consist of a public place or building used for the exchange of goods, or in a broader sense it may consist of the world, a country, a city, or a locality, as world market, foreign market, domestic market, Chicago market, etc. The markets may vary by the type of produce sold, as a fish market, wheat market, live-stock market, etc.

Markets have existed from the time when men began to diversify their products. At first they were entirely local in character. To-day, in Europe nearly every town, and in America nearly all the large cities, have one or more market places. These may be simply open public squares in some centrally located district, or they may be substantial buildings fitted up with stores, booths, and containing cold-storage rooms for the preservation of perishable goods. The primary object in establishing such markets was to enable the producer and consumer to deal directly with each other.

As transportation facilities improved the area over which exchange took place increased accordingly. The development of cold storage and refrigeration widened the area from which perishable products are obtained and lengthened the season during which they are available. The ease and cheapness with which agricultural products may be carried long distances has brought about a very complicated system of marketing and given employment to a large number of middlemen. Many purchasers of agricultural products send their agents to the farms and purchase produce direct, but in the majority of instances one or more persons intervene in the process. There have been developed among farmers associations or organizations to eliminate one or more of these intermediators. The farmers have formed coöperative elevators to handle their grain, coöperative creameries and cheese factories to manufacture and sell their dairy products, egg circles to collect and sell their eggs, and produce exchanges to sort, distribute, and sell their fruits and vegetables.

The purpose in forming the coöperative organizations is to improve the business methods and add to the efficiency in the distribution and sale of farm products. Generally the organization is so arranged that each member benefits in proportion to his contribution of the produce sold. Generally he can own but one share and have but one vote. There are many modifications of this form, but the closer the organization adheres to these principles the greater is its chance of success.

Some of the advantages of coöperative marketing are that a group of farmers dealing in the same produce are normally educating one another and thus improving their methods of production. This improvement will generally take the form of a more uniform production, either through the growing of a better variety or through the better methods of packing and grading. Other advantages of coöperative marketing are the lower costs in distributing a large shipment than many small ones, the prompt news service with regard to prices and market conditions in large trade centres, and the ability to sell on the market offering the best inducements. Coöperative selling associations can con-

trol sufficient capital and employ able managers, and sell only to trustworthy persons who can be depended upon to pay cash on delivery and thus eliminate the necessity of the producer having much capital himself.

In associated marketing the producers insure one another against loss in particular sales, in that the association does not distribute the proceeds of each sale but accumulates the proceeds of all the sales and distributes the net amounts. This type of marketing association has been extensively developed in distributing the more or less perishable produce of the farmer. Co-operative marketing has been developed in the United States principally for the sale of fruits, vegetables, dairy products, and grains. In many European countries the coöperative idea has extended to the slaughtering and packing of various animals and to the gathering and distributing of poultry and eggs. The coöperative idea has had its greatest development in Denmark, where it revolutionized the agriculture of the country and added greatly to the prosperity of its rural population.

MARKET OVERT (Fr. *ouvert*, open). In the English law, an open or public market. The law of *market overt* is that the purchaser in good faith gets a good title to any goods which he may buy in such a market, even though the vender did not own or have a right to sell them. The law originated in an old Saxon custom which prohibited the sale of anything above the value of 20 pence, except in open market and in the presence of witnesses. The theory was that lost or stolen goods would probably be identified in a public market by the owner before the tradesman or original thief could dispose of them. This custom became the law of England after the Conquest, and was modified so as to include goods of any value and to dispense with the necessity of witnesses. It is applied to every kind of personal chattel except horses. By subsequent statutes the law was further modified, so that at present if stolen goods are sold in open market the title reverts in the owner upon the conviction of the thief. Only certain ancient markets have this character, outside of London, where every public shop is a market overt and every day is market day. This law has never existed in the United States. See **SALE**.

MARKET VALUE. The value of an article as established by public sales of such property in a particular locality. Market value may be established by regular market quotations where these exist or by the testimony of persons familiar with the price at which such property sells regularly in the market. If the market price is abnormally enhanced or depressed at the time and place for delivery of any goods, by wrongful combinations or by an illegal monop-

oly, other evidence than the market sales may be resorted to for the purpose of showing the fair market value of the property in question. Consult the authorities referred to under **TORT; DAMAGES; CRIMINAL LAW**.

MARKHAM, SIR ALBERT HASTINGS (1841-). A British admiral, distinguished for his participation in Arctic exploration. He was born at Bagnères. After his education in the Royal Navy Academy at Southsea, he entered the navy and served in China (1856-64), where he was commended for efficiency in the suppression of the Taiping rebellion and for his part in the operations leading to the fall of Peking. He rose to lieutenant (1862), commander (1872), captain (1876), rear admiral (1892), and admiral (1903). To advance the interest of Arctic exploration, he made a cruise in Baffin Bay in the whaler *Arctic*, which brought back in 1873 survivors of the *Polaris* American Arctic expedition. He commanded the *Alert* in the British Arctic expedition of 1875-76, when he reared the Union Jack, May 23, 1876, on the Arctic Ocean to the north of Grinnell Land, in the most northern point reached up to that time (83° 20' 26"). In 1879 he made a cruise to Nova Zembla. From 1901 to 1904 he was commander in chief at the Nore, and in 1906 he retired. Among his publications are: *The Cruise of the "Rosario"* (1873); *A Whaling Cruise to Baffin Bay* (1874); *The Great Frozen Sea* (1877); *A Polar Reconnaissance* (1880); *Life of Sir John Franklin* (1890).

MARKHAM, SIR CLEMENTS ROBERT (1830-1916). An English traveler, geographer, and author, born at Stillingfleet, York. He was educated at Westminster School and in 1844 entered the navy. In 1850 he was made lieutenant and in 1851 accompanied the expedition sent to search for Sir John Franklin; traveled in Peru (1852-54); accompanied the British expedition against Abyssinia (1867-68); entered the geographical department of the India Office (1867-77); was editor of the *Geographical Magazine*, secretary of the Hakluyt Society in 1858-87, and later secretary and then president of the Royal Geographical Society, from which he retired in 1905. He was knighted in 1896. He published: *Franklin's Footsteps* (1852); *Travels in Peru and India* (1862); *A History of the Abyssinian Expedition* (1869); *Major James Rennell and the Rise of Modern English Geography* (1895); *Richard Hakluyt: His Life and Work, with a Short Account of the Aims and Achievements of the Hakluyt Society* (1896); *Memoir of Archbishop Markham* (1906); *Richard III* (1906); *Quichua Dictionary* (1908); *Life of Sir Leopold McClintock* (1909); *The Story of Majorca and Minorca* (1909); *The Incas of Peru* (1910).

MARKHAM, (CHARLES) EDWIN (1852-). An American poet, born in Oregon City, Oreg. When 5 years old he was taken to live in California, and there during his boyhood he worked at farming, blacksmithing, and cattle and sheep herding. The San José Normal School and two Western colleges equipped him to serve first as a school principal and later as a school superintendent in California. He began to write verse for the California papers at an early age. His best-known poem, *The Man with the Hoe*, published in book form with other verses in 1899, had an immense vogue and made his name known the country over. He followed his success East, and resided in or near New York

City, where he was engaged chiefly in journalistic work for many years. He was elected a member of the National Institute of Arts and Letters. His other books include: *Lincoln and Other Poems* (1901); *The Poetry of Jesus* (1909); *Children of Bondage* (1909), with others; *The Shoes of Happiness, and Other Poems* (1914); *California the Wonderful* (1914).

MARKHAM, GERVASE or JERVIS (c.1568-1637). An English author, born at Gotham, Nottinghamshire. He served as a soldier in the Low Countries and attained a captaincy in the English army. Well versed in the classical and modern languages, he took up literature as a means of livelihood and prepared numerous volumes for the press. He wrote largely on topics connected with sport, and is also known for some indifferent poetry. A few works attributed to him were certainly written by others, but those regarded as genuine include: *The Most Honorable Tragedie of Sir Richard Grinville* (1595); *The Poem of Poems* (1595); *Covelarice, or the English Horseman* (1607); *Hunger's Prevention* (1621).

MARKHAM, WILLIAM (c.1635-1704). An American Colonial Governor, born in England. He was a first cousin of William Penn, by whom he was sent to America as Deputy Governor of Pennsylvania after the grant in 1681. On his arrival at New York, Brookholls, acting Governor in the absence of Andros, surrendered his authority over Penn's grant and gave him a letter to the local authorities. Proceeding to Pennsylvania, Markham called a council Aug. 3, 1681, and almost immediately began a controversy with Lord Baltimore about the Maryland boundary. He chose the present site of Philadelphia for the great city to be built, instead of that of the Swedish settlement of Upland (Chester), which was Penn's choice. When Penn arrived in 1682 Markham went to England to represent the colony in the boundary dispute, and when Penn returned to England Markham came again to America and was made Secretary of the Province and the Territories (the lower counties on the Delaware). He was Deputy Governor of the Territories in 1691, and was Lieutenant Governor for Governor Fletcher of New York (1693 to 1695), the crown having revoked the grant made to Penn and assumed control. He was continued in office until 1699 by Penn, who in 1694 had again secured possession, and during this time the new constitution was passed. Many charges, such as conniving at piracy and using courts to protect fraud, were made against him. Penn was not altogether satisfied with his course, but ordered him to be appointed Register-General of Wills in 1703. Markham was an Episcopalian and therefore out of sympathy with the aims of the Friends, nor was he a man of the force of character needed to cope with the Quakers.

MARKHOR, mär'kôr. See GOAT.

MARKING-NUT. The fruit of *Semecarpus anacardium*, a large tree of the family Anacardiaceæ, a native of the mountains of India. It has oblong leaves and terminal panicles of flowers. The fruit is a heart-shaped, black nut, seated on a large swollen receptacle, which when ripe is roasted and eaten, although when raw it is astringent and acrid. Between the two coats of the nutshell is a black, acrid juice, much in use for marking cotton cloths, a mixture of quicklime and water being applied to prevent

it from running and to brighten the color. It is also used as an external application in rheumatism.

MARKIRCH, mär'kêrk (Fr. *Sainte-Marie-aux-Mines*). A town of Upper Alsace, Germany, situated on the Leber, 40 miles southwest of Strassburg. It is an important manufacturing centre for cotton and woolen goods, and there is also a large dyeing industry. In the Middle Ages the town was famous for its silver, copper, and lead mines, which were abandoned during the nineteenth century, but reopened early in the twentieth. Cotton weaving was begun here in 1755. Markirch was occupied by the French in the European War which broke out in 1914. (See WAR IN EUROPE.) Pop., 1910, 11,778, about one-half Protestants.

MARKLAND, JEREMIAH (1693-1776). An English classical scholar and text critic. He was born at Childwall, England, and was educated at London and Cambridge. His works included a number of emendations of the text of Lysias and of Euripides, made partly in notes contributed to the edition of Lysias by Taylor and to Musgrave's edition of the *Hippolytus* of Euripides, partly in editions of the *Supplices*, the *Iphigenia in Aulide*, and *Iphigenia in Tauride* of Euripides; an edition of the difficult *Silvæ* of Statius (1728, 1824), which is considered a masterpiece of acute criticism; and *Remarks on the Epistles of Cicero to Brutus* (1745), in which he tried to prove them spurious. His attacks on the authenticity of the Ciceronian orations *Pro Domo Sua*, *Post Reditum in Senatui*, *Ad Quirites*, and the *De Haruspium Responsis*, in which he was afterward followed by F. A. Wolf, started a famous and long-standing controversy. Consult Wolf, *Litterarische Analekten*, vol. ii (Berlin, 1818), and J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

MARKLE, JOHN (1858-). An American coal operator, born at Hazelton, Pa. He graduated from Lafayette College in 1880; became general superintendent in the mines of his father's company; and later became president of the G. B. Markle Company, the successor of his father's firm and one of the largest "independent" anthracite-coal firms in Pennsylvania. John Markle represented the independent operators in the negotiations with President Roosevelt in the settlement of the anthracite coal strike of 1902, and he became president and chief engineer of the Jeddo Tunnel Company and of the Wilkes-Barre and Hazelton Railroad.

MARKOE, THOMAS MASTERS (1819-1901). An American surgeon. Born in Philadelphia, he graduated from Princeton in 1836 and from the College of Physicians and Surgeons, New York, in 1841. He was professor of anatomy in Castleton Medical College, Vermont, and of pathological anatomy at the medical department of the University of the City of New York (1852-54). In 1860 he became adjunct professor of surgery in the College of Physicians and Surgeons, being elected professor in 1870 and professor of the principles of surgery in 1879. He is author of *A Treatise on Diseases of the Bone* (1872).

MARKS, MRS. L. C. See PEABODY, JOSEPHINE PRESTON.

MARK TWAIN. The nom de plume of S. L. Clemens.

MARL (OF. *marle*, *merle*, Fr. *marne*, OHG. *mergil*, Ger. *Mergel*, from ML. *margila*, dim.

of Lat. *marga*, marl, from Gall. *marga*, Bret. *marg*, marl, Gk. *ἀργίλος*, *argilos*, white clay). A somewhat indefinite term applied in different localities to widely different materials. In a general sense it means essentially a naturally occurring mixture of calcium carbonate and clay with more or less sand, which usually falls to pieces on exposure to the air. Although probably the greater number of the marls of the United States conform to this definition, and depend for their agricultural value on their lime content, there are quite extensive deposits of the Cretaceous marls, known as greensand (especially in New Jersey), which contain variable but usually small amounts of lime and considerable amounts of potash (mainly silicate) and phosphoric acid. The name is also sometimes applied to friable clays, or mixtures of clay and sand, in which there is almost no trace of lime. Marl beds are widely distributed in the Atlantic coastal plain and have been exploited to a considerable extent in New Jersey, Maryland, Virginia, North Carolina, and South Carolina. The marls of these deposits generally belong to three classes and occur in geological formations which are found, as a rule, one above the other in immediate succession. The upper layer, blue or shale marl (Neocene), generally found at or near the surface, consists chiefly of sea mud with partially decomposed shells and bones. Its value depends mainly upon its content of carbonate of lime (40 to 50 per cent), although it contains in addition small percentages of potash (0.25 to 4.75 per cent) and phosphoric acid (trace to 1.75 per cent). This class predominates in Maryland, Virginia, and North Carolina, and has been used to a considerable extent with good results on worn-out or naturally infertile soils. The second class, Eocene or chalky marl, is commonly a coarse, friable chalk, consisting of comminuted shells and corals, of a light yellowish or grayish color to white, sometimes compacted into a solid limestone. Its content of lime is greater (50 to 95 per cent) than that of the shell marl, and the percentage of potash and phosphoric acid is smaller. In the lower layer occur the Cretaceous marls (greensand), which vary considerably in chemical composition and agricultural value. Their fertilizing value is determined largely by their content of potash (3.5 to 7 per cent) and phosphoric acid (1 to 4 per cent), although many are calcareous (1.25 to 9 per cent of lime). These marls have long been used with beneficial results by New Jersey farmers, although the benefit is more marked in case of marls rich in phosphoric acid and lime than in case of pure greensand containing a high percentage of potash, probably because the potash is in the form of an insoluble silicate (glauconite) and is very slowly available to plants.

Marl is both a direct and an indirect fertilizer, improving both the chemical and physical conditions of soils, correcting acidity, unlocking insoluble plant food, and promoting nitrification. It is very lasting in effect and has been used from ancient times for improving soils. But because lime (q.v.) is quicker in action it has been used in many cases instead of marl, although some kinds of marl are extremely useful on certain soils. On account of its bulkiness and the large amounts which must be applied in order to secure beneficial results, marl can be used profitably only in close proximity to the deposits.

Booth, in a report of the State geologist of Delaware, recommends 60 to 100 bushels per acre as the proper amount to be applied on poor light soils, 100 to 200 bushels on clay soils, while 200 to 500 bushels may be used with advantage on soils of good quality abundantly supplied with humus. The addition of quicklime to marl (30 to 40 bushels of lime to 300 to 400 bushels of marl) has been found to quicken the action of the marl. It is generally advisable to let marl lie exposed to the air some time before it is incorporated with the soil, that any poisonous compounds present may be destroyed.

The foregoing applies particularly to the impure marine marls of the coastal plain and their use for fertilizer. In those parts of the glaciated region where the soil is somewhat calcareous, e.g., in Maine, northwestern Connecticut, western New York, northern Indiana, and southern Michigan, marl deposits of quite a different type are found. They are formed in lakes, largely through the action of algae on calcareous water, and sometimes attain a thickness of 100 feet. This fresh-water marl is nearly pure calcium carbonate, and in recent years has been used very largely in the manufacture of Portland cement, especially in Michigan. Consult: Edmund Ruffin, *Calcareous Manures* (Shellbanks, Va., 1835); Ullmann, *Kalk und Mergel*; State geological reports of Alabama, Delaware, Florida, Georgia, Indiana, Kentucky, Maryland, Michigan, New Jersey, North Carolina, South Carolina, and Virginia; Maryland Agricultural Experiment Station Report, 1889; and especially *Bulletin 243* of the United States Geological Survey (1905), on "Cement Materials and Industry of the United States," by E. C. Eckel.

MARLATT, mär'lät, CHARLES LESTER (1863—). An American entomologist, born at Atchison, Kans. He was educated at the Agricultural College at Manhattan, Kans. (B.S., 1884; M.S., 1886), where he was assistant professor for two years. From 1889 to 1894 he was assistant entomologist, and thereafter first assistant and assistant chief entomologist, of the Bureau of Entomology, United States Department of Agriculture. He made entomological investigations for the Department in China, Japan, and Java in 1901-02. In 1912 he was appointed chairman of the Federal Horticultural Board to attend to the enforcement of the plant quarantine law to prevent the importation of diseased plants into the United States, a law which he had helped to secure. Marlatt was president of the Entomological Society of Washington in 1897-98 and of the Association of Economic Entomologists in 1899. His publications are for the most part official reports and bulletins.

MARLBOROUGH, mär'lbe-rü. An old and interesting town in Wiltshire, England, pleasantly situated in the valley of the Kennet, 75 miles west of London (Map: England, E 5). It is located in the midst of chalk hills known as the Marlborough Downs. The chief edifice is the "college" (founded in 1843), a handsome building occupying the site of an old castle built by Henry I. In this a Parliament, whose enactments were called the Statutes of Marlbridge, was held during the reign of Henry III. The town corporation dates from 1200. It owns remunerative real estate and a water supply and maintains an isolation hospital and sewage farm. Its products include cordage, leather, and malt. Pop., 1901, 3046; 1911, 4401.

MARLBOROUGH, mär'lbür-ö. A city, in-

cluding several villages in Middlesex Co., Mass., 28 miles west of Boston, on the Boston and Maine and the New York, New Haven, and Hartford railroads (Map: Massachusetts, D 3). Among the features of Marlborough are a handsome city hall, public library, high-school building, post office, hospital, and a soldiers' monument. There are extensive boot and shoe, box, and carriage factories, miner's lamp works, and manufactories of shoemaking machinery. The government is vested in a mayor, annually elected, a bicameral council, and administrative departments. The members of the license department are appointed by the mayor; of the police, fire, and street departments, by the mayor with the consent of the council; while the members of the water, health, and poor departments are elected by the council. The water works are owned by the city. Pop., 1890, 13,805; 1900, 13,609; 1910, 14,579; 1914, 14,991; 1920, 15,028. Settled in 1656, Marlborough was incorporated as a town in 1660 and was chartered as a city in 1890. In 1676, during King Philip's War, it was almost wholly destroyed by the Indians. Out of the parts of the original township Westborough was formed in 1717, Southborough in 1727, and Hudson in 1866. Consult Hudson, *History of the Town of Marlboro, Massachusetts* (Boston, 1862), and E. A. Bigelow, *Historical Reminiscences of the Early Times in Marlborough, Massachusetts, and Prominent Events from 1860 to 1910* (Marlborough, 1910).

MARLBOROUGH. The northeastern district of South Island, New Zealand (Map: New Zealand, South Island, D 2). Area, 4325 square miles, of which about 100 square miles are devoted to farming and 2625 to sheep grazing. It has a large business in dairy products; much timber is cut. Coal, gold, and copper are found in the district. Pop., 1906, 14,368.

MARLBOROUGH, DUCHESS OF. See JENNINGS, SARAH.

MARLBOROUGH, JOHN CHURCHILL, first DUKE OF (1650-1722). A celebrated English general. He was born probably June 24, 1650, at Ashe in the Parish of Musbury, Devonshire, the second son of Sir Winston Churchill, a politician and historian and a staunch supporter of the Stuarts. John Churchill was educated at St. Paul's School, but early in life entered the army. He saw some service at Tangier against the Moors, and from 1672 to 1677 he bore arms on the Continent against the Netherlands, serving part of the time under the great Turenne. A new era in the history of war was then beginning. Artillery and musketry had displaced entirely the old pikeman, and rapidity of movement henceforth decided campaigns. In 1674 Louis XIV made Churchill a colonel of his regiment, and in 1678 he was made colonel of foot in the English service. Though there was no question of Churchill's ability, still the rapidity of his promotion was due also to the fact that some time between 1665 and 1668 his sister Arabella had become the mistress of the Duke of York. About 1676 Churchill fell in love with Sarah Jennings (q.v.), who was a lady in waiting of Princess Anne (later Queen Anne), and noted for her imperiousness and her beauty. The couple were married early in 1678, and thus Churchill gained the favor of Princess Anne, who was under the complete domination of her dictatorial attendant. In the following years he was occasionally employed in diplomatic missions to Holland, but usually he was

in attendance on the Duke of York. In 1682 he was created Baron. When in 1685 the Duke of York ascended the throne as James II, Churchill became still more prominent. He commanded a body of troops to suppress the rebellion of the Duke of Monmouth (q.v.), and his coolness prevented a serious disaster to the royal troops at Sedgemoor (q.v.). Churchill was strongly attached to the English church, and his eulogists have maintained that he would not have betrayed it under any circumstances. This may be doubted, but he certainly did not desert the cause of the Church when he noticed the current of public opinion turning more and more against King James. The result was that he withdrew gradually from participation in the acts of this reign, and, though still affecting loyalty to the King, he began negotiations with William of Orange, and when the latter landed in England in 1688 Churchill was one of the first to go over to him with his troops. During the early part of the reign of William III he was in high favor; in 1689 was made Earl of Marlborough, and distinguished himself greatly during the invasion of Ireland, but lost all favor when he was suspected, and justly so, of preparing to betray William III and aid James II to recover the throne, of which he had helped to deprive him. Nevertheless, on the commencement of the War of the Spanish Succession in 1701 Marlborough was intrusted by William III with the command of the British army in the Netherlands. On March 8, 1702, however, the King died.

With the accession of Anne began the great epoch of Marlborough's life. Through his wife he controlled the Queen, while the son of the powerful minister Godolphin (q.v.) had in 1698 married his daughter. Thus he had a fairly free hand to carry out his great military exploits, though the allies, Dutch and Germans, often caused difficulties. The troops of the Emperor Leopold I were commanded by the great Prince Eugene (q.v.). Marlborough, who had been elected also captain general of the Dutch forces, took command in May, 1702, and in December was created Duke of Marlborough. He had under him about 10,000 English troops, 20,000 Dutch troops, and as many mercenaries, chiefly Germans. He was opposed by a French army of 75,000 men. The great danger to the allies was that the French would control the Rhine valley and thus completely isolate Austria. In order to prevent this Marlborough, who had been conducting a series of brilliant operations in the Low Countries, in the summer of 1704 made a rapid march to Bavaria and, having joined Prince Eugene, met the French on equal terms at Blenheim (q.v.) on Aug. 13, 1704. The battle was decided when Marlborough, by a skillful use of his cavalry, broke through the French centre and the enemy retired in great confusion. In this series of operations, instead of the old method of detailed operations and sieges, the two great leaders had concentrated all their forces in the important territory, and there by one decisive victory had won the whole campaign. Not the whole credit of the successes of the allies is due to Marlborough, a full half belonging to Eugene. For this victory great honors and pecuniary rewards were bestowed on Marlborough and he was made a Prince of the Empire (Austria). (See **BLENHHEIM HOUSE**.) He won other important victories during the war, as when he compelled the

French under Villeroi to evacuate the whole of Flanders by his victory at Ramillies on May 23, 1706, and, together with Eugene, defeated Vendôme at Oudenarde on July 11, 1708. By this last victory and the capture of Lille the road to Paris was opened, but Marlborough had no longer a free hand. His wife had had several quarrels with Anne, and the Queen was ridding herself of the complete ascendancy of the Duchess. Moreover, England was suffering from the burdens imposed by the long struggle, and the Tories, who opposed the war, were coming into power. On Sept. 11, 1709, Marlborough and Eugene won a doubtful victory at Malplaquet, but it was the last great battle of the English general. The same year the Duchess was dismissed by Anne, a Tory ministry assumed office, and in 1711 Marlborough was relieved of his command. His enemies accused him of having embezzled the public money, and for a time he was deprived of his offices, though the charge was not pressed. In his last years he was without influence or friends, being, in spite of his victories, unpopular on account of his avarice. Godolphin had died and most of the great lords were his enemies. Upon the accession of George I in 1714 he was made captain general and master of the ordnance, but took little part in public affairs. He died June 16, 1722, leaving a large fortune.

Marlborough has often been severely treated by historians. He was unquestionably unscrupulous and avaricious. On the other hand, it was a time when this was true of nearly all public men, regardless of party, and Marlborough has received more blame simply because he was more prominent. His military abilities, however, have never been questioned. Unlike his two great successors, Frederick the Great and Napoleon, he was never entirely unhampered. He was always compelled to have regard for the wishes of his allies and the political situation in England. But he was the first since classic times to impress upon generals the need of rapidity of movement and the execution of campaigns as a whole. Moreover, he had the ability, which only the greatest commanders have, to amalgamate the different elements of his army, to become the hero of his soldiers. His campaigns always showed a grasp of the proportion of things. He never frittered his strength away on details, but waited for the decisive battle. Among generals, he is one of the very few who never lost a battle, and never failed in a campaign.

Bibliography. Sir George Murray, *Private Correspondence of the Duke and Duchess of Marlborough* (2 vols., London, 1838); id., *Letters and Dispatches of John, Duke of Marlborough, from 1702 to 1712* (5 vols., ib., 1845); id., *Letters of the Duchess of Marlborough* (ib., 1875). The most complete life is that of William Coxe, *Memoirs of the Duke of Marlborough* (3 vols., London, 1847-48), but it is too partial to Marlborough. A bitter attack on Marlborough is in Macaulay's *History*; while an impartial character-study is to be found in G. E. B. Saintsbury, *Marlborough* (London, 1879). For the military history of Marlborough, and an estimate of him as a general, consult: T. A. Dodge, *Gustavus Adolphus and the Development of the Art of War* (Boston, 1895); Sir Archibald Alison, *Military Life of the Duke of Marlborough* (ib., 1879); F. W. O. Maycock, *An Outline of Marlborough's Campaigns* (New York,

1913); S. J. Reid, *John and Sarah, Duke and Duchess of Marlborough, 1660-1744* (ib., 1914); also general histories like J. R. Green, *History of the English People* (8 vols., New York, 1905-08).

MARLBOROUGH HOUSE. A mansion on the south side of Pall Mall, London, erected in 1710 by Sir Christopher Wren for the first Duke of Marlborough. It was bought by the government in 1817. In it Princess Charlotte and her husband, Prince Leopold, and subsequently the Queen Dowager Adelaide, lived. In 1863 it became the property and city residence of the Prince of Wales.

MAR/LIN. A city and the county seat of Falls Co., Tex., 28 miles southeast of Waco; on the Houston and Texas Central and the International and Great Northern railroads (Map: Texas, D 4). It is in a noted cotton-growing district and carries on an important trade in cotton, grain, and live stock. Among the industrial plants are several cotton gins, a cotton compress, a large cottonseed-oil mill, and brick and marble works. As a health resort, Marlin has considerable reputation, derived from its hot artesian wells, 3350 feet deep, the waters of which have a temperature of 147° F. and possess valuable medicinal properties. There are fine hotels and sanatoriums, a courthouse, and an opera house. The water works are owned by the city. Pop., 1900, 3092; 1910, 3878.

MARLIN. A godwit (q.v.).

MARLINESPIKE (from *marline*, from Dutch *marlijn*, from *marren*, to bind, Goth. *marzjan*, OHG. *marrjan*, dialectic Ger. *merren*, to retard, hinder, Eng. *mar* + *lijn*, Eng. *line*), **MARLINSPIKE**, or **MARLINGSPIKE.** A pointed iron instrument, used by sailors in knotting, splicing, etc. It is generally 8 to 12 inches long, about an inch in diameter at the head and tapering to a point at the other end. Its chief use is in separating the strands of rope or in opening out a knot which is jammed so tightly that it cannot be untied otherwise. In marling and in serving it is used as a lever to haul the turns taut. A large wooden instrument of the same general shape is termed a *fid*. See **KNOTTING** AND **SPLICING**.

MARLINSPIKE. The New England name for the boatswain or boatswain bird (q.v.).

MAR/LITT, E., the pseudonym of EUGENIE JOHN (1825-87). A popular German novelist, born at Arnstadt. Her father was a portrait painter; her patroness was the Princess of Schwarzburg-Sondershausen, who sent her to Vienna to study music. She became deaf, lived for 11 years at court, and then, withdrawing to Arnstadt, began there her novelistic career. *Die zwölf Apostel* (1865), *Goldelse* (1868), *Das Geheimnis der alten Mamsell* (1868), *Thüringer Erzählungen* (1869), *Reichsgräfin Gisela* (1870), *Heideprinzesschen* (1872), *Die zweite Frau* (1874), and other novels are familiar in English translations. They have little literary value. Her collected works appeared in 10 vols. (Leipzig, 1888-90; 2d ed., 1891-94).

MARLOW, or **GREAT MARLOW.** A municipal borough and market town in Buckinghamshire, England, on the north bank of the Thames, 32 miles west of London (Map: England, F 5). It is a much frequented fishing resort. Here Shelley wrote the *Revolt of Islam* in 1817. It has manufactures of silk, lace, paper, and furniture. Pop. (urban district), 1901, 4526; 1911, 4683.

MARLOWE, mär'lô, CHRISTOPHER (1564-93). A great English dramatist, the most important of Shakespeare's predecessors, and in some sense his master. The son of a shoemaker, he was born at Canterbury probably in February, 1564, and was educated at the King's School, Canterbury, and at Corpus Christi College, Cambridge, where he graduated in 1583, and took his M.A. in 1587. Here he made a thorough acquaintance with the Latin classics, and translated Ovid's *Amores* into English verse. His life after leaving Cambridge is hard to trace in detail. It seems to have been spent chiefly in London and to have been characterized by a revolt against conventional morality and established religion. His career ended untimely and unhappily: it was his misfortune to be killed in a drunken brawl at Deptford. Of the blasphemy and gross immorality that have often been ascribed to him he was probably not guilty. However, upon his reputation for heresy and irreligion (possibly grounded originally on his association with his old Cambridge tutor, Francis Kett, who was burned as a heretic at Norwich in 1589), was based a warrant for his arrest issued a few days before death removed him from the jurisdiction of the Privy Council. It is pleasanter to dwell on his intercourse with the chief men of letters in his time, including Kyd, Nash, Greene, Chapman, Raleigh, and probably Shakespeare. Whatever his life may have been, there can be no question of the magnificence of his genius and the far-reaching influence which he had upon the development of the English drama.

Not only did he establish the iambic pentameter as the recognized vehicle for serious drama, but he made it something more than it had been in various experiments since *Gorboduc* (1562). The metre became a living thing in his hand; by skillful variation of pause and accent, by the swift and smooth carrying along of the thought from line to line, it grew to be that blank verse which Milton perfected into one of the glories of English poetry. But his work was wider than this. Dropping the imitation of Seneca which had been trying to naturalize itself in England, he struck out boldly to create English tragedy by the laws of his own genius. The prologue to *Tamburlaine* contains what is really a manifesto, not only promising to lead his audience away

From jiggig veins of rhyming mother-wits

by his blank verse, but proclaiming a doctrine of unity far more healthful than the classical tradition which was endeavoring to impose itself upon England—the unity which comes from centering the action about one great passion, one mighty character. Great as was the age, stupendous as were its flights beyond what had been thought the uttermost limits of the possible, Marlowe is able to keep up with them, to find for them the "high astounding terms" which lend his tragedies such sublimity. In humor he was deficient; his touch is not always sure, and in his search for effect he sometimes overleaps himself and falls into bathos; but as a daring pioneer he won, and now more than ever, since Lamb and Hazlitt restored him to his place, keeps a rank among the very highest. It is hard to set limits to what he might have been had his life been prolonged; but after all his achievement is ample in that he made Shakespeare possible. After *Tamburlaine* (?1587;

printed 1590), comes probably the first dramatic rendering of the Faust legend in *Doctor Faustus* (?1589; printed 1604); *The Jew of Malta*, specially noteworthy for its relation to the *Merchant of Venice* (?1589; printed 1633); his most successful attempt at English historical drama, *Edward II* (?1592; first published 1594). The probable sources of Marlowe's important plays may be indicated here. In his *Tamburlaine* he seems to have relied mainly on Fortescue's translation (1571) of Pedro Mexias's Spanish life of Timur (1543), supplemented by hints from the *Vita Magni Tamerlanis* of Perondino (1551). *Doctor Faustus* was based on a story familiar enough in the Middle Ages, and used in a variant form by Calderon in *El Magico Prodigioso*; its earliest literary form appeared at Frankfurt in 1587. For *Edward II*, like Shakespeare, he makes free use of the chronicles of Stowe and Holinshed. In other words he collaborated with Nash, and possibly with Shakespeare, a share in at least the second and third parts of *Henry VI* being plausibly attributed to him. Of his nondramatic work the most important things are his unfinished paraphrase of the *Hero and Leander* of Musæus, and the famous lyric, "Come live with me and be my love." Consult his *Works*, ed. by Alexander Dyce (3 vols., London, 1850); by A. H. Bullen (3 vols., Boston, 1885); four plays, ed. by Ellis, with an introduction by J. A. Symonds, in the "Mermaid Series" (London, 1887); also A. W. Verity, *Influence of Christopher Marlowe on Shakespeare's Earlier Style* (London, 1886); Fischer, *Zur Charakteristik der Dramen Marlowes* (Munich, 1889); J. G. Lewis, *Christopher Marlowe* (London, 1891); A. W. Ward, *History of English Dramatic Literature to the Death of Queen Anne* (New York, 1889); J. A. Symonds, *Shakespeare's Predecessors in the English Drama* (London, 1900); Seecombe and Allen, *Age of Shakespeare*, vol. ii (3d ed., ib., 1909); Swinburne's *Marlowe* (conveniently accessible in New York, 1908 ed.); G. E. Woodberry, "Marlowe," in *The Inspiration of Poetry* (New York, 1911); W. L. Phelps, in *Essays on Books* (ib., 1914); and the exhaustive article by Sidney Lee in the *Dictionary of National Biography*, vol. xxxvi (London, 1893).

MARLOWE, JULIA (1870-). An American actress, born near Keswick, England, Aug. 17, 1870, her real name being Sarah Frances Frost. She came with her parents to America when five years old. Her later childhood was passed in Cincinnati, where at the age of 12 she had her first dramatic experience in a juvenile opera company. Four years afterward she began seriously to study for the stage, and in 1887 she appeared in New York, but it was in Boston, in December, 1888, that she won, as Parthenia in *Ingomar*, an assured place as a star. An actress of unusual personal charm, she soon became a popular favorite in a variety of rôles, especially as Viola in *Twelfth Night* and as Rosalind in *As You Like It*. In 1894 she was married to Robert Taber, with whom for a time she played, but they separated, and in 1899 were divorced. In 1913 she married E. H. Sothorn, whose associate she had been almost continuously since 1904. Among Miss Marlowe's successes may be mentioned her Highland Mary in *For Bonnie Prince Charlie* (1897); Barbara Friethie in Clyde Fitch's play of that name (1899); and Charlotte Durand in the dramatization of Cable's *Cavalier* (1902); *Colin-*

ette (1903); *Queen Fiametta*, and *When Knight-hood was in Flower* (1904). In the autumn of 1904 she began a co-star engagement with E. H. Sothern, under the management of Charles Frohman, appearing chiefly in Shakespearean plays. She met with unusual success in the rôles of Juliet, Rosalind, Beatrice, Portia, and Katherine in *The Taming of the Shrew*. Subsequently she appeared at various times in modern plays, but with no great success, and she came to confine herself almost entirely to Shakespearean parts. At the opening of the Century Theatre in New York, 1909, she appeared with E. H. Sothern in a production of *Antony and Cleopatra*. From 1910 to 1914, with her husband, she toured most successfully in Shakespearean repertoire, annually appearing for a season in New York. Indeed, both in artistic worth and in popularity, the Sothern and Marlowe productions of Shakespeare were the most notable of their time. Consult: McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); L. C. Strang, *Famous Actresses of the Day in America* (Boston, 1899); William Winter, in *Wallet of Time*, vol. ii (New York, 1913).

MAR/MADUKE, JOHN SAPPINGTON (1833-87). An American soldier, born near Arrow Rock, Mo. After studying at Yale and Harvard, he entered West Point and graduated there in 1857. In 1858-59 he saw service in the West, participating in the Utah expedition to subdue the Mormons, who were rebelling against the United States government. In 1861 he entered the Confederate army as first lieutenant, though almost immediately promoted to be lieutenant colonel. In 1862 as colonel of an Arkansas regiment he bore the guiding colors at Shiloh and captured the first prisoners. He was seriously wounded on the second day, and while recovering was recommended for promotion to brigadier general. During 1863 he was in Missouri and defeated the Federal forces at Taylor's Creek. He commanded the cavalry at Price's defense of Little Rock and here fought a duel, killing Gen. L. M. Walker. The next year he was promoted to be major general and led one of the three columns in General Price's Missouri raid, was taken a prisoner of war, and was held until August, 1865. He afterward engaged in the commission and insurance business (1866-71) and from 1871 to 1874 was editor successively of *The Journal of Commerce*, *St. Louis Evening Journal*, and *The Illustrated Journal of Agriculture*. He was secretary of the State Board of Agriculture in 1874. From 1875 to 1880 he was a railroad commissioner. In 1884 he was elected Governor of Missouri and died in office.

MARMANDE, măr'mänd'. The capital of an arrondissement in the Department of Lot-et-Garonne, France, on the Garonne River, 40 miles southeast of Bordeaux (Map: France, S., E 4). Its parish church is an interesting thirteenth-century Gothic edifice. Marmande has a communal college, schools of commerce and agriculture, and manufactures rope, cloth, canvas, and hats. It is situated in a region extensively engaged in agriculture and the cultivation of the vine. Pop. (commune), 1901, 9873; 1911, 9832.

MÁRMAROS-SZIGET, măr'mó-rôsh sí'gét, or MÁRAMAROS-SZIGET. The capital of the County of Mármaros, Hungary, beautifully situated on the Theiss and at the base of the wooded Carpathians, 232 miles east-northeast of Budapest (Map: Austria-Hungary, H 3). Its

institutions include a school of law, a Roman Catholic and a Reformed Gymnasium, and a teachers' seminary. It has important salt mines worked from ancient times which still have a large output. It also produces lumber, spirits, and vinegar. Pop., 1900, 17,445; 1910, 21,370.

MARMETTE, măr'mèt', JOSEPH (1844-95). A Canadian novelist. He was born in Montmagny, Quebec, and early devoted himself to a literary career, choosing the historical novel as a medium for bringing before the French-Canadians the stirring incidents of their history. He published: *Charles et Eva* (1867); *François de Bienville* (1870), portraying the unsuccessful siege of Quebec by Sir William Phips in 1690; *L'Intendant Bigot* (1872), a description of the closing years of French rule in Canada; *Le Chevalier de Mornac* (1873); and *Le tomahawk et l'épée* (1877).

MARMIER, măr'myá', XAVIER (1809-92). A French author, born in Pontarlier. He traveled extensively in Switzerland, Holland, and Germany. In 1835 he was attached to the scientific voyage of the *Recherche* to the Arctic Sea, at which time he acquired a knowledge of the Danish, Swedish, and Finnish languages. On his return in 1839 he was made professor of foreign literature at Rennes, and two years later received a sinecure under the Minister of Public Instruction. In 1842-49 he was again traveling, everywhere studying languages, idioms, and literature. His numerous works include narratives of his journeys and translations from the German and Scandinavian, such as *Histoire de la littérature en Danemark et en Suède* (1839); *Du Rhin au Nil* (1846); *Voyage pittoresque en Allemagne* (1858-59); *Cimarrósa* (1867); and *Contes russes* (1889). Consult the *Life* by Estignard (1893).

MAR/MION. A metrical romance by Sir Walter Scott (1808).

MARMION, SHACKERLEY (1603-39). An English dramatist, educated at Wadham College, Oxford, where he graduated B.A. in 1622 and M.A. in 1624. After trying his fortune in the Low Countries, he settled in London, where he lived somewhat riotously, and was at one time arrested for stabbing a man in a brawl. There he became associated with Ben Jonson, Heywood, and other literary men. He accompanied Sir John Suckling on the showy expedition to Scotland (1638). Falling ill at York, he was brought back to London to die. Marmion made a verse paraphrase of the *Cupid and Psyche* of Apuleius (1637), which was greatly admired by his contemporaries. It was reprinted by S. W. Singer in 1820. For the court, Marmion wrote several comedies, which are still interesting. They comprise *Hollands Leaguer* (performed 1632); *A Fine Companion* (printed 1633); *The Antiquary* (performed 1636). Consult his *Dramatic Works*, ed. by Maidment and Logan (Edinburgh, 1875).

MÁRMOL, măr'mól, José (c.1818-71). An Argentine poet and patriot, born at Buenos Aires. As Deputy and Senator for his native province, he took so firm a stand for the rights of the people that he was banished by Rosas. After the overthrow of the dictator Mármol was again Senator for Buenos Aires and had charge of the National Library until he lost his eyesight. He published a drama *El poeta* (1842); *El Peregrino* (1846); *El Cruzado*, a drama (1851); *Armonías* (1851); *Poesías* (2d ed., 1854); and an historical novel, *Amalia* (1855).

This last is the work by which Mármol is most widely known both at home and abroad, having been translated into French and German. After his death some of his poems and dramas were collected and published by his biographer, José Domingo Cortés, under the title *Obras poéticas y dramáticas de José Mármol* (Paris, 1875).

MARMONT, măr'môn', AUGUSTE FRÉDÉRIC LOUIS VIESSE DE, DUKE OF RAGUSA (1774-1852). A marshal of France, born July 20, 1774, at Châtillon-sur-Seine. He entered the French army in 1791 and was rapidly promoted. He met Bonaparte at Toulon, served with distinction in the Italian campaign, particularly at Lodi and Castiglione, and later accompanied Bonaparte to Egypt, where he became brigadier general. On returning to France Marmont supported Napoleon in the coup d'état of the eighteenth Brumaire, and afterward continued in active military service. After the battle of Marengo (1800) he was made a general of division. In 1801 he was inspector general in chief of artillery, and in 1805 he was made commandant of the army in Holland. His services in defending the Ragusan territory against the Russians and Montenegrins in 1806-07 won him his title of Duke of Ragusa. After the battle of Wagram (1809) he was intrusted with the pursuit of the enemy, and after the battle of Znaim he was made a marshal. He was thereafter for 18 months Governor of the Illyrian provinces, and in 1811 succeeded Masséna in the chief command in the Peninsula, where he assumed the offensive, and kept Wellington in check for 15 months, but was eventually defeated in the battle of Salamanca (July 22, 1812). A wound compelled him to retire to France. In 1813 he fought at the battles of Lützen, Bautzen, and Dresden. He maintained the contest with great spirit in France in the beginning of 1814; and it was not until further resistance was hopeless that he concluded a truce with Prince Schwarzenberg, which was followed by the abdication of Napoleon. The Bourbons at first loaded Marmont with honors and distinction. On the return of Napoleon from Elba Marmont was excluded from the general amnesty, and he fled to Aix-la-Chapelle. After the second Restoration he spent much of his time in agricultural pursuits, till the revolution of 1830, when, at the head of a body of troops, he attempted in vain to put down the insurrection, and finally retreating with 6000 Swiss, and a few battalions that had continued faithful to Charles X, conducted him across the frontier. From that time he resided chiefly in Vienna. He died in Venice, March 2, 1852. He was the last survivor of the marshals of the first French Empire. His *Mémoires* (9 vols., 1856-57) are valuable for the history of his time. He was also the author of *Voyage en Hongrie* (1837) and *Esprit des institutions militaires* (1845).

MARMONTEL, măr'môn'têl', ANTOINE FRANÇOIS (1816-98). A French pianist, born at Clermont-Ferrand, Puy-de-Dôme. He studied in 1828-32 at the Paris Conservatory, where he returned to teach in 1836, and in 1848 succeeded his former master, Zimmermann, as pianoforte professor. He published three books of piano studies, besides sonatas, nocturnes, serenades, minuets, reveries, and mazurkas, and his literary productions are: *Art classique et moderne du piano* (1876); *Eléments d'esthétique musicale et considérations sur le beau dans les arts* (1884); and *Histoire du piano et de ses origines* (1885).

MARMONTEL, JEAN FRANÇOIS (1723-99). A French dramatist, novelist, and critic, born at Bort, July 11, 1723, best known for two series of *Contes moraux* (1761-86), and the moralizing novels *Bélisaire* (1767) and *Les Incas* (1777). He studied for the church, but was attracted to letters by the patronage of Voltaire, went to Paris (1745), became a journalist, and won some success by his tragedies: *Denys le tyran* (1748) and *Aristomène* (1749). In 1753 a sinecure office attached him to the court at Versailles. During 1758 and 1759 he edited the *Mercure*. He was imprisoned 10 days in the Bastille for political satire in 1760, was elected to the Academy in 1763, and made its permanent secretary in 1783. His numerous contributions to the *Encyclopédie* (see DIDEROT) were collected as *Eléments de littérature* in 1787. He wrote also *Mémoires* and a treatise on French versification (1763). MarmonTEL's *Works* were edited by himself in 17 volumes, to which 14 were subsequently added. They were reedited by Villeneuve (Paris, 1819-20). The *Mémoires* are best edited by Tourneux (Paris, 1891). There was an English translation in 1904. Consult C. A. Sainte-Beuve, *Causeries du lundi*, vol. iv (Paris, 1857-62), and S. Lenel, *MarmonTEL, un homme de lettres au XVIII^e siècle* (ib., 1902).

MARMORA, LA. See LA MARMORA.

MARMORA, măr'mô-râ, SEA OF (anciently PROPONTIS). A small sea between European and Asiatic Turkey, communicating with the Ægean Sea by the Strait of the Dardanelles (anciently Hellespont), and with the Black Sea by the Bosphorus (Map: Balkan Peninsula, G 4). It is of an oval form, 140 miles in length by 45 miles in breadth, and the east shore is indented by the two large gulfs of Ismid and Injir Liman (Mudania). The depth is generally over 600 feet, and in some places reaches over 4000. There is a current running through it from the Black Sea to the Ægean. Its navigation is not difficult and it is a great avenue of commerce. It contains many islands, of which the largest is Marmora or Marmara, famous for its white marble quarries, which supplied the materials for several famous buildings of antiquity. During the European War which broke out in 1914, the Sea of Marmora was of great military importance. The only practical means of getting munitions of war into Russia and of getting supplies of grain, etc., from Russia was closed on account of the belligerency of Turkey. To open up this highway of commerce a great allied fleet attacked the Dardanelles simultaneously with a Russian naval attack on the Bosphorus. See WAR IN EUROPE.

MARMOR LUNENSE. See CARRARA; LUNA.

MARMOSET, măr'mô-zêt' (OF. *marmoset*, *marmouset*, Fr. *marmouset*, puppet, from ML. *marmoretum*, marble figure, from Lat. *marmor*, Gk. *μάρμαρος*, *marmaros*, marble, from *μαρμαίρειν*, *marmairein*, to sparkle). One of the small and pretty American monkeys formerly considered to be comprised in two genera (*Hapale* and *Midas*) of the family Hapalidae. These little creatures are distinguished from all other American monkeys by several features besides their diminutive size, long hind legs, long fur, and penciled ears. Their dentition is like that of the Old World monkeys in that it comprises only 32 teeth, without the four "wisdom" molars possessed by the Cebidæ. (See MONKEY.) Their thumbs are not opposable, their nails are in the

form of claws, and their tails (which are long and bushy) are not prehensile. These and other characters place them at the foot of the scale of the monkeys, and next to the lemurs. They are arboreal in habits and climb about in small parties in search of fruit and insects, much as squirrels do; and they habitually produce two or three young at a birth instead of one, as is usual with higher monkeys. Elliot in his *Review of the Primates* groups the tamarins and marmosets in the family Callitrichidae, dividing this into six genera, *Seniocebus*, *Cercopithecus*, *Leontocebus*, *Ediponidas*, *Callithrix*, and *Callicebus*. He recognizes about 65 forms. The common ouistiti (*Hapale*, or *Callithrix jacchus*) of Brazil is a familiar pet throughout tropical

DENTITION OF THE
MARMOSETS.

America, and is often brought to the United States or taken to Europe, but rarely survives even the first northern winter. It is not larger than a half-grown kitten, and is usually blackish, with the back and thighs banded with gray,

and two great tufts of hair on the ears pure white; the tail is ringed with black and gray. Several other species and varieties are known, some of which are vari-colored and others pure white. The smallest, and one of the most widely distributed, is only 7 inches long.

The tamarins, or silky marmosets, differ in dentition and also in the absence of tufts on the ears and the rings of color on the tail. Like the others, they are common pets in South and Central America, and some kinds stray as far north as central Mexico. Several species are well known, especially the negro tamarin (*Midas*, or *Cercopithecus ursulus*) of the lower Amazon valley; the queer little pinché (*Midas*, or *Edipomidas*, *ædipus*) of the Isthmus, which has a great growth of white hair on the head; and the silky marmoset, or marikina (*Midas*, or *Leontocetus*, *rosalia*), which is clothed in long silky hair of a golden hue; this hair forms a long mane on the head and neck, giving the name lion monkey to some varieties. This species is often seen in menageries, and is a common pet in its own country. Consult authorities mentioned under MONKEY; especially H. W. Bates, *A Naturalist on the River Amazons* (London, 1910). See Plate of AMERICAN MONKEYS.

MAR/MOT (Fr. *marmotte*, from It. *marmotta*, *marmontana*, from Rumanian *murmunt*, from OHG. *murmunto*, Ger. *Murmel*, from ML. *mus montanus*, mountain mouse, marmot). A name given to rodents of the ground-squirrel family. They resemble squirrels in their dentition, although in their form and habits they more resemble rats and mice. The animal to which the term (now little used) was first applied was the common marmot (*Arctomys alpinus*, or, as it is now known, *Marmota marmota*) of the mountains of Europe. It is about the size of a rabbit, grayish yellow, brown towards the head. It feeds on roots, leaves, insects, and the like, is gregarious, and often lives in large societies. It digs large burrows with several chambers and two entrances, generally on the slopes of the mountains, where the marmots may be seen sporting and basking in the sunshine during the fine weather of summer. They spend the winter in their burrows, in one chamber of which is a store of dried grass; but the greater part of the winter is passed in tor-

pidity. The alpine marmot is easily tamed. These features and habits are characteristic of the group. A half-dozen other species occur in Europe, Asia, and North America. The best-known American species are the woodchuck and its larger relative of the Rocky Mountains. See WHISTLER; WOODCHUCK; and Plate of GOPHERS, LEMMINGS, and MARMOTS.

MARMOUSETS, mär'mōō'zâ' (Fr., little men). A name given in contempt to the counselors of Charles VI of France (q.v.). They were for the most part members of the lesser nobility or of the citizen class and were despised by his uncles, who had governed the kingdom during the minority of Charles. Consult Ernest Lavisse, *Histoire de France*, vol. iv, part i (Paris, 1902).

MARNE, märn (Lat. *Matrona*). A river of France, the principal tributary of the Seine (Map: France, N., J 3). It rises in the Plateau of Langres, flows first northwest, then westward, with many windings through the departments of Haute-Marne, Marne, Aisne, and Seine-et-Marne, passes Chaumont, Saint-Dizier, Châlons, Epernay, and Meaux, and joins the Seine at Charenton, about 4 miles above Paris. Its length is 325 miles, and it is navigable for 226 miles to Saint-Dizier. It is a rather rapid stream, supplying power to a number of mills. It is paralleled in the upper reaches by lateral canals and its large traffic has been extended by means of canals, of which the most important is the Marne-Rhine Canal, which extends 195 miles from Vitry to Strassburg, passing through several tunnels. The great offensive movement of the Germans through France during the European War which began in 1914 received a final check at this stream, resulting in the series of very severe engagements lasting several days and known collectively as the battle of the Marne. See WAR IN EUROPE.

MARNE. An inland department in the northeast of France, part of the old Province of Champagne, extending southward from the frontier department of Ardennes (Map: France, N., J 4). Area, 3168 square miles. The department is traversed by the Marne River and a small portion of the Seine and Aisne. The soil is very fertile in the south, producing oats, wheat, rye, and barley, but chalky and arid in the north; on this dry and chalky soil, however, the best grapes for champagne wine are grown, especially in the neighborhood of Epernay and Avize and between the Marne and the Vesle. Cotton, metal, and woolen manufactures are largely carried on, also sheep raising and bee culture. There are large iron and copper foundries, blast furnaces, and machine works. Capital, Châlons-sur-Marne; important towns are Rheims and Epernay. Pop., 1891, 434,734; 1901, 432,882; 1911, 436,310.

MARNE, HAUTE. A department of France. See HAUTE-MARNE.

MARNIAN EPOCH. The name applied to the second Iron Age, or culture stage of Europe. It is so called from the Department of Marne, in northeastern France; also termed La Tène Period, from a station of that name in Switzerland. It lasted until the first century B.C. in France, Bohemia, and England, and until the tenth century A.D. in Scandinavia. It corresponds with the late Celtic of English archaeologists. See NEOLITHIC PERIOD.

MARNIX, mär'niks, PHILIP VAN, BARON SAINTE-ALDEGONDE (1538-98). A Flemish

statesman and writer, born at Brussels. He studied theology under Calvin and Beza at Geneva and returned to his native country (1560) a devoted adherent of the Reformed religion and a sworn foe of the Spanish government and the Inquisition. Upon the appointment of the Duke of Alva to the governorship of the Netherlands (1567) Marnix sought refuge in Germany. He shared in the labors of William of Orange, who, in 1572, sent him as his representative to the first meeting of the Estates of Holland at Dordrecht. After a year's captivity in the hands of the Spaniards he entered upon an active diplomatic career as representative of the Protestant provinces at Paris and London, and in 1578 at the Diet of Worms. He took a prominent part in the formation of the Union of Utrecht. (See NETHERLANDS.) In 1583 he became burgomaster of Antwerp, and, after a 13 months' siege, was forced to surrender the city to Alexander of Parma (1585). Thereafter he took little share in political life. His writings in prose and verse form a part of the classic literature of the Netherlands. Of these the most important are: *De roomsche byenkorf* (1569), a satire; an excellent translation of the Psalms; and *Wilhelmus van Nassouwe*, which has become one of the national hymns of the Netherlands. His works were published at Brussels in seven volumes by Lacroix and Quinet (1855-59). Consult: E. Quinet, "Marnix de Sainte-Aldegonde," in *Œuvres complètes*, vol. v (Paris, 1857); *Cambridge Modern History*, vol. iii (Cambridge, 1904); A. Elkan, *Philipp Marnix von St. Aldegonde* (Leipzig, 1909).

MARNØ, mār'nø, ERNST (1844-83). A German explorer of western Africa. He was born at Vienna and in 1866-67 went to Abyssinia. In 1869 he traveled to Khartum, then south to Fadasi, and in 1871 and 1872 explored the upper course of the White Nile. In 1874 he joined Gordon, who in 1878 put him in command of the District of Galabat, where he did much to suppress the slave trade. He died in Khartum. He wrote *Reisen im Gebiete des weissen und blauen Nil* (1874) and *Reise in der ägyptischen Aequatorialprovinz und in Kordofan in den Jahren 1874-76* (1878).

MAROBODUUS. See MARBO; MARCOMANNI.

MAROCOCCO, mā-rōk'ō. See MOROCCO.

MAROCCHETTI, mā'rō-kēt'tē, CARLO, BARON (1805-67). An Italian sculptor. He was born at Turin, studied under Bosio and Gros, in Paris, and resided at Rome from 1822 to 1830. In 1827 he received a medal for his "Girl Playing with a Dog." His first important work was a statue of Emmanuel Philibert of Savoy at Turin, commissioned by Carlo Alberti of Sardinia, in recognition of which service he was made Baron. He subsequently returned to Paris. The most important of his works at Paris include: "Battle of Jemappes," a relief upon the Arc de Triomphe de l'Etoile; a monument to Bellini in Père-Lachaise Cemetery; and the marble group of the "Apotheosis of the Magdalen" on the high altar of the church of the Madeleine. In consequence of the revolution of 1848 he emigrated to England. His most important works there are an equestrian statue of Richard Cœur de Lion, which was cast in bronze by national subscription and is now near the entrance to the House of Lords, Westminster; equestrian statues of the Queen and of Wellington, for Glasgow; a portrait bust of Prince Albert; a statue of Lord Clyde in Waterloo Place and that of Thackeray

in Westminster Abbey. He also modeled an equestrian statue of Washington for the New York Crystal Palace (since destroyed), a study of which is in the Metropolitan Museum of Art. His style is academic, but distinguished by some independence of treatment and skill in technique. He received the cross of the Legion of Honor in 1839 and was elected to the Royal Academy in 1866.

MARONI, mā'rō-nē' (Dutch *Marowijne*). A river forming the boundary between Dutch and French Guiana (Map: Guiana, G 3). It rises in the Tumuc Humac Mountains on the frontier of Brazil and flows northward through a densely forested region, falling in a number of cascades over the successive escarpments of the terraced plateau. It enters the Atlantic after a course of 425 miles. Below the last cascade, 46 miles from its mouth, it is a wide, deep, and beautiful stream, connected with the estuary of the Surinam by the navigable Cottica Creek running parallel with the coast.

MARONITES. A Christian sect of Syria, of very ancient origin. The most probable account represents them as descendants of a remnant of the Monothelite sect (see MONOTHELITISM), who, in the early part of the eighth century, settled on the slopes of the Lebanon, their chief seats being around the monastery of Maron, a saint of the fourth century, whose life is found in Theodoret's *Religious Histories* (iii, p. 1222). The emigrants are said to have elected as their chief and patriarch a monk of the same name, with the title of Patriarch of Antioch, and, throughout the political vicissitudes of the succeeding centuries, to have maintained themselves in a certain independence among the Moslem conquerors. In the twelfth century, on the establishment of the Latin Kingdom of Jerusalem, the Maronites abandoned their distinctive Monothelite opinions and recognized the authority of the Roman church. In 1445 they entered into a formal act of union with Rome. In 1584 a college was founded in Rome by Gregory XIII for the education of the Maronite clergy; and in 1736 they formally subscribed to the decrees of the Council of Trent. Nevertheless, although united with Rome, they are permitted to retain their distinctive national rites and usages. They administer communion in both kinds; they use the ancient Syriac language in their liturgy; their clergy, if married before ordination, are permitted to retain their wives; and they have many festivals and saints not recognized in the Roman calendar. The Maronites at present are about 300,000 in number. Their patriarch is still styled Patriarch of Antioch, and resides in the convent of Kanobin, in the heart of the Lebanon. He is chosen by the bishops subject to the approval of Rome, and always bears the name Butrus (Peter). Every tenth year he reports the state of his patriarchate to the Pope. Under him are 14 bishops, to whom are subject the officiating clergy of the smaller districts. The revenues of all orders of ecclesiastics, however, are very narrow, and the inferior clergy live in great measure by the labor of their hands. About 40 convents, including 15 nunneries, are to be found in the Lebanon, with about 2000 members, who wear a distinctive costume and follow the rule of St. Anthony. The chief seat of the Maronites is the district called Kesrowan, on the western declivity of Mount Lebanon; but they are to be found scattered over the whole territory of the Lebanon, and in all the towns

and larger villages towards the north in the direction of Aleppo, and southward as far as Nazareth. They have also spread to Cyprus and Egypt, to Europe, the French colonies, and America. Their political constitution is a kind of military republic, regulated for the most part by ancient usages and by unwritten but well-recognized laws. Like the Arabs of Syria, they have a political hierarchy, partly hereditary, partly elective. The chief administration is vested in four superior sheiks, who possess a sort of patriarchal authority, and under these are subordinate chiefs, with whom, as in the feudal system, the people hold a military tenure. They are bitter enemies of their neighbors, the Druses (q.v.). Their chief occupations are cattle raising and silk culture.

Bibliography. C. H. Churchill, *The Druzes and the Maronites under the Turkish Rule from 1840 to 1860* (London, 1862); Albert Socin, *Palästina und Syrien* (Leipzig, 1880); Koehler, *Die katholische Kirche der Morgenländer* (Darmstadt, 1886); Bliss, "Essays on the Sects of Syria and Palestine—the Maronites," in the *Palestine Exploration Fund Quarterly Statement* (London, 1892); F. N. Nau, *Opusculs Maronites* (2 vols., Paris, 1899–1900); F. J. Bliss, *The Religions of Modern Syria and Palestine* (New York, 1912).

MAROON (Fr. *marron*, chestnut, chestnut colored, from It. *marrone*, chestnut). A subdued crimson color, not so yellow as chestnut (*marron*), from which the name is probably derived, nor so brilliant as magenta.

MAROONS (Fr. *marron*, apocopated, from *simarron*, Spanish *cimarron*, fugitive, from *cima*, mountain top, twig, from Lat. *cyma*, Gk. *κύμα*, *kyma*, sprout, from *κύνειν*, *kyein*, to conceive). A name given in Jamaica and Dutch Guiana to runaway negro slaves. The term was first applied to those slaves who ran away and took refuge in the uplands when their Spanish masters were driven out by the British after the latter conquered Jamaica, in 1655. For 140 years they maintained a constant warfare with the British colonists; but in 1795 they were subdued and a portion of them removed to Nova Scotia, where they gave so much trouble that most of them were transported to Sierra Leone. The Maroons of Dutch Guiana still form a number of small independent communities practicing various pagan rites, some of which can be traced to analogous African ceremonies. They are now known more commonly as Bush negroes.

MAROS, mō'rōsh. The principal river of eastern Hungary. It rises in the mountains of eastern Transylvania and flows westward, past Arad, emptying into the Theiss at Szegedin, after a course of 543 miles (Map: Hungary, G 3). It is navigable about two-thirds of its length to Karlsburg, but its navigation is impeded by the great irregularity of its volume. The conjunction of the floods of the Theiss and Maros destroyed Szegedin in 1879.

MAROS-NÉMETH (mä'rōsh-nā'mēt) AND **NADASKA**, COUNT VON. See GYULAI, FRANZ.

MAROS-VÁSÁRHELY, vä'shär-hël-y'. A royal free town and capital of the County of Maros-Torda in Transylvania, Hungary, situated on the river Maros, 49 miles east-southeast of Klausenburg (Map: Hungary, J 3). It has a castle which is now used for barracks, and connected with which is a fifteenth-century Gothic church; the Teleki palace, with a fine library of over 70,000 volumes (including a manuscript of

Tacitus) and a natural-history collection; a technical school for metal workers, a college with a library and printing press, two Gymnasias, and an industrial museum. There are several other notable Catholic churches, many fine buildings, a county hospital, and a museum. The industries of the town include the manufacture of sugar, tile, pottery, shoes, spirits, tobacco, beer, trimmed lumber, and the refining of petroleum. Pop., 1900, 19,522; 1910, 25,517, mostly Magyars.

MAROT, má'rō', CLÉMENT (1495–1544). A French poet, born at Cahors in Quercy between 1495 and 1497. He went to Paris with his father, the poet Jean Marot, about 1507, and began the study of law, which he early abandoned in favor of literature. In 1513 he became a page in the service of Nicholas de Neufville, the powerful lord of Villeroy, and two years later wrote his first original poem, the *Temple de Cupidon*, which was dedicated to the new King Francis I. This graceful allegory was inspired by the *Roman de la rose*, while its metrical form, though superior to contemporary works in its smoothness, was strongly influenced by the work of his predecessors, the school of the *rhétoriciens*. Thanks to this work, he became in 1518 *valet de chambre* of Marguerite d'Alençon, the future Queen of Navarre. Having entered the service of Francis I, he set out with the King on the ill-fated expedition to Pavia which resulted in the capture of the latter and the imprisonment of the poet in 1525. Marot was soon released, however, and returned to France. After this he is more original and less an imitator of Crétin, *souverain poète français*. Immediately after his return he was suspected of heresy and, in spite of a strong denial, was imprisoned in 1526, first in Paris and then less rigorously at Chartres. During his imprisonment he began his edition of the *Roman de la rose* and composed three of his best-known poems—the epistle to Bouchart protesting his innocence of the charge, his *Enfer*, and his famous letter to Lyon Jamet on the Lion and the Rat, from which La Fontaine drew his well-known fable. The King freed him on his return to France in 1526 and appointed him *valet de chambre* to succeed his father, Jean Marot, who died in 1527. In October of the same year he was again arrested for having attempted, while engaged in a prank, to save a comrade from the hands of the police. An amusing epistle to the King, in which the poet describes his efforts to bribe the state's attorney, won his release. In 1529 he composed an incomplete edition of his poetry which probably appeared during the course of the same year under the title *Adolescence Clémentine*, but of which the first edition extant is that of 1532. To this period belongs also the beautiful *Complainte, en forme d'épilogue* on the death of the Queen mother Louise de Savoie (1531), which was imitated by Spenser in his *Shepherd's Calendar*. Suffering from the plague which devastated France in 1531, Marot wrote to the King his famous *Epistre pour avoir esté dérobé*, a masterpiece of its kind, in which the poet gives a very amusing account of how he was robbed by his *valet de Gascogne*. He now fell once more under suspicion of heresy, and withdrew to the court of Margaret at Nérac, where he probably occupied his time in preparing an edition of the poems of François Villon (q.v.), which he published at the end of the year 1533. The preface of this work is worthy

of note as containing the first warm appreciation of the works of the vagabond poet. After the affair of the placards he fled to Italy, taking refuge at the court of the Duchess of Ferrara, Renée de France. During his stay in Italy he began to compose his *blasons*, which were immediately imitated in France, becoming the source of an abundant literature. His epistles *Du Cog-à-Pène*, of which he wrote several while at Ferrara, form the point of departure of a popular literary genre. Taking advantage of the truce of 1536, he returned to Lyons and was publicly obliged to abjure his heretical ideas. He was now to enjoy several years of court favor during which he composed his beautiful *Eglogue au roy sous les noms de Pan et Robin*, one of the few works of this period that reveal a feeling for nature. Immediately after his arrival he began his long quarrel with a former friend, François Sagon, in which nearly all the leading poets took part. Their contributions were collected in a volume, published in 1537, entitled *Plusieurs traictez par aucuns nouveaulx poètes du différend de Marot, Sagon et la Hueterie*. In 1539, with the help of the scholar Vatable, he commenced his poetical translation of the Psalms. At first they were well received and sung to popular tunes. But the Sorbonne took umbrage at such a procedure, and Marot was obliged to seek safety in flight. He went first to Geneva, where his Psalms were being sung in all the Protestant churches (1542). But he soon got into trouble with Calvin, and then went to Turin, where he died in the autumn of 1544. Marot is very important as a poet of transition. In his work we see the germ of the new school. He excels in the lighter vein, such as epigrams, epistles, fables, and songs, to which he has given his stamp. He was also one of the first to bring the sonnet and Italian elegy into France. His translation of the Psalms was completed by the Protestant leader Beza and is still used in French Protestant churches. In character he was a good-natured epicurean, having no desire for martyrdom.

Bibliography. His works were frequently collected (1534, 1538, 1542, 1544, etc.), best by Lenglet-Dufresnoy (4 vols., 1731), and Jannet (4 vols., 1868-72). The elaborate edition of Guiffrey, begun in 1876, has not yet been completed, only three of the six volumes having thus far appeared. The best biography is that of G. Guiffrey (1911). Consult also: Henry Morley, *Clement Marot, and other Studies* (London, 1871); E. O. Douen, *Clément Marot et le Psautier huguenot* (2 vols., Paris, 1878-79); A. A. Tilley, *Literature of the French Renaissance*, vol. i (New York, 1904). Other works of interest relating to him are Voizard, *De Disputatione inter Marotum et Sagontum* (Paris, 1885); Paul Bonnefon, "Le différend de Marot et de Sagon," in the *Revue d'histoire littéraire de la France*, vol. i (ib., 1894); Henry Guy, *De Fontibus Clementis Maroti Poetæ* (ib., 1898); Albert Wagner, *Clément Marots Verhältniss zur Antike* (Leipzig, 1906); Lefranc, *Grands écrivains de la Renaissance* (Paris, 1914).

MAROT, DANIEL (c.1660-1718). A French decorative designer and engraver, born in Paris, son of the architect and engraver Jean Marot. Daniel Marot, being a Huguenot, fled to Holland in 1685 when the Edict of Nantes was revoked, and accompanied William of Orange to England, where he was appointed one of the

King's architects and was especially active at Hampton Court. Much of the furniture there was designed by him and resembles the plates in his published books, especially the monumental beds with their plumes of ostrich feathers and elaborate crimson-velvet valances. At Windsor Castle there is a silver table attributed to him. After the death of King William in 1702 Marot returned to Holland, where in 1712, at Amsterdam, he published *Œuvres du Sieur D. Marot, architecte du Guillaume III, roi de la Grande Bretagne*. As a youth in France he made many designs for Boullée, especially of tall clocks and bracket clocks, and his style is always definitely Louis XIV. The most accessible collection of his designs is in T. A. Strange's *French Interiors, Furniture, etc.* (London, 1907).

MAROT, HELEN (1865-). An American labor leader. She was born in Philadelphia and was active in the labor movement there and in New York, where she became executive secretary of the Woman's Trade Union League. She was also an investigator of child-labor conditions. Her writings include *A Handbook of Labor Literature* (1899) and *American Labor Union* (1914), the latter being an authoritative presentation of the trade-unionist point of view of the labor movement.

MAROT, JEAN (1620-79). One of the greatest of French architectural engravers. He was born in Paris, designed numerous houses, and was for a short time associated with Jacques Lemercier (q.v.). He published *Architecture française, ou recueil des plans élévations, coupes, et profils des églises, palais, hôtels, et maisons particulières à Paris* and a work on the château of Richelieu. He was the father of Daniel Marot.

MAROTIA. A Roman lady of the tenth century who played an important part in the political history of the times. She was the daughter of the infamous Theodora (q.v.) and Theophylact, "consul and senator of the Romans." Her first husband was Alberic (q.v.); after his death she married Guido of Tuscany; and after the death of the latter, Hugo, King of Italy. By the power of her family and by her marital alliances she had entire control of Rome for some years. She deposed Pope John X in 928, and in the following year he was either strangled or starved to death. A little later she bestowed the papacy upon her son, John XI, who by popular rumor was supposed to be the offspring of her guilty love with Pope Sergius III. She styled herself "Senatrix" of all the Romans and "Patricia." Soon after her third marriage Marozia and her husband were thrown into prison in 932 by her son, Alberic II (q.v.). Her husband escaped, but nothing is known of her fate. Consult Ferdinand Gregorovius, *History of the City of Rome in the Middle Ages*, translated from the fourth German edition by Annie Hamilton, vol. iii (London, 1895).

MARPLOT. A meddler, good-natured busybody in the *Busybody* (q.v.).

MARPLOT, OR THE SECOND PART OF THE BUSYBODY. A comedy by Susanna Centlivre (q.v.). It was performed at the Drury Lane Theatre, Dec. 10, 1710, and afterward altered by Henry Woodward and called *The Marplot of Lisbon*. This character reappears in 1825 as Paul Pry in the comedy by John Poole, and resembles Sir Martin Marall in Dryden's successful comedy, founded on Lord Newcastle's *Marplot*, a translation of Molière's *L'Etourdi*.

MAR'PREL'ATE, MARTIN. See MARTIN MARPRELATE CONTROVERSY.

MARPURG, mär'pürg, FRIEDRICH WILHELM (1718-95). A German writer on music, born at Seehausen in Prussian Saxony. Little is known of his early life, but in 1746 he was secretary to General von Rothenburg at Paris, where he met Rameau, Voltaire, and D'Alembert. From there he went to Hamburg, and in 1763 was made director of the government lottery in Berlin. He composed six clavier sonatas, organ pieces, and sacred and secular songs. He is, however, better known as a writer on music, his most noteworthy works being: *Abhandlung von der Fuge* (1753-54), a standard work; *Handbuch beim Generalbass und der Composition* (1755-58); *Anleitung zum Clavierspielen* (1755); *Anleitung zur Musik überhaupt und zur Singkunst insbesondere* (1763), which are of interest at the present time.

MARQUAND, mär-kwänd', ALLAN G. (1853-). An American archæologist and art historian. He was born in New York and after graduating from Princeton studied at Berlin and Johns Hopkins universities (Ph.D., 1888). In 1896-97 he was professor of archæology at the American School of Classical Studies at Rome and from 1883 was professor of art and archæology at Princeton, serving also as director of the museum of historic art from 1890. In 1885 he became associate editor of the *American Journal of Archaeology*. Among his writings are: a valuable *Textbook of the History of Sculpture* (1896-99), written in collaboration with A. L. Frothingham; *Greek Architecture* (1909); *Della Robbias in America* (1912); *Luca della Robbia* (1914); beside contributions to journals of art and archæology. He is considered the principal authority on the Della Robbias and their art.

MARQUAND, HENRY GURDON (1819-1902). An American capitalist and philanthropist, born in New York City. He prepared for college, but went into business as agent of his brother, Frederick Marquand (1799-1882), a New York jeweler and a benefactor of Union Theological Seminary and Yale Divinity School. This post the younger brother held for 20 years, after Frederick's retirement in 1839. Afterward he became prominent in Wall Street, especially in connection with railroad enterprises. Among his benefactions, mention should be made of a chapel and, with Robert Bonner (q.v.), a gymnasium presented to Princeton University, of a pavilion to Bellevue Hospital, and of contributions of paintings and other beautiful objects to the Metropolitan Museum of Art.

MARQUARDT, mär'kvärt, JOACHIM (1812-82). A German historian and antiquarian, born at Danzig. He studied at Berlin and at Leipzig and in 1859 was appointed director of the Gymnasium at Gotha, where he remained until his death. His chief work was his continuation of W. A. Becker's *Handbuch der römischen Altertümer* (1849-67). To the second edition (1871-82), almost completely rewritten, in which he was assisted by Theodor Mommsen, he contributed *Römische Staatsverwaltung*, vols. iv-vi (1873-78, 1881-85); and *Das Privatleben der Römer*, vol. vii (1879-82; 2d ed., 1886).

MARQUE (Fr., seizure), LETTERS OF. Commissions issued by a belligerent state to vessels owned and manned by private persons, either its own citizens or neutrals, authorizing them to carry on hostilities at sea against the enemy.

The usage originated in the practice of issuing letters of license to go across the boundary (mark, or march) and make reprisals. Such vessels were known as privateers and were freely employed by maritime nations at war in the sixteenth and seventeenth centuries. In the latter part of the eighteenth century most of the states of Europe enacted laws forbidding their subjects to take letters of marque from any foreign power for use against any power with which they themselves were at peace, and similar laws were passed by the United States Congress in 1797 and 1816. This put an end to privateering by neutrals, but the practice of authorizing subjects of a nation at war to prey on the enemy's commerce continued to the middle of the last century. It was declared abolished by the Declaration of Paris, which concluded the Crimean War (1856), and the declaration was accepted by most of the powers. Of the great powers only the United States refused to become a party to the declaration unless it included a provision exempting innocent commerce of a belligerent from capture by the enemy. As this has not yet (1915) been conceded the government of the United States is still technically free to employ this method of carrying on maritime warfare, but as no civilized state has issued letters of marque since the Conference of Paris, the practice may be considered obsolete. The use by a belligerent government of fast merchant vessels as auxiliary cruisers must not be confounded with the practice of privateering. In that case the private vessel is taken over by the government and embodied in its regular naval force. See PRIVATEERING.

MARQUESAS (mär-kä'säs) ISLANDS, or **MENDAÑA** (mán-dä'nyä) ISLANDS (Fr. *les Marquises*). A group of islands in Polynesia, in about lat. 10° S. and long. 140° W. Area, 494 square miles (Map: World, Western Hemisphere, K 7). The most important members of the group are Nukahiva (183 square miles) and Hiva-oa (153 square miles). The 11 islands, of which six are inhabited, fall into two groups which show considerable differences of dialect. With the exception of a few atolls, they are mountainous, falling abruptly into the sea on all sides, and reaching in Hiva-oa an altitude of 4158 feet. The summits are bare, and only the narrow valleys, terminating in small bays, and filled with luxuriant vegetation, are inhabited. Climate is hot and generally humid, though for six months in the year there is very little rainfall. The chief product, like that of Polynesia in general, is copra; oranges are also produced. The Marquesans form an interesting group of the Polynesian race, of which they are physically among the best representatives. They are very tall, with subdolichocephalic head form. In language they are closely related to the Hawaiians, and one stream of Hawaiian migration passed through the Marquesas. The Marquesans are an admixture of Proto-Samoan and Tongafiti elements, with a strong preponderance of the latter. Among Marquesan things worthy of note are the carved and ornamented axes and oars, feather diadems, coconut slings, carved paddle-shaped clubs, etc. Their food consists very largely of breadfruit. The Marquesans appear to have been warlike, and traces of cannibalism lingered long among them. The stone terraces of Waiko are of interest in connection with similar remains elsewhere in Polynesia. (See MEGALITHIC MONUMENTS.) The inhabitants are

steadily decreasing in numbers. In the early part of the nineteenth century the population was estimated at 20,000; in 1876 it was 5240; in 1900, 4300; and, in 1912, 3117. The Marquesans are all civilized and Christians; there are very few Europeans in the islands. The group is administered by native chiefs subject to the French Resident at Hiva-oa. The southern group of the Marquesas was discovered in 1595 by Mendaña de Neyra, a Spanish navigator; the northern group was discovered in 1791 by an American, Ingraham, who gave it the name of Washington Islands. Peculiar interest attaches to the Marquesas because of the fact that this archipelago was the first noncontiguous territory to be annexed to the United States. This assumption of sovereignty was proclaimed in 1813 by Commodore David Porter, of the *Essex*, but no action was taken by the government at Washington. The islands were left very much to themselves until 1842, when they were annexed by France. Consult Vincendon, *Iles Marquises* (Paris, 1843), and Churchill, *Easter Island* (Washington, 1912).

MARQUESS. See MARQUIS.

MARQUETRY (Fr. *marqueterie*, from *marqueter*, to inlay, from *marque*, mark). A decorative or pictorial inlay (q.v.) on furniture, of thin pieces of wood or veneer, ivory, bone, brass, tortoise shell, mother-of-pearl, etc. Marquetry is the French name for what the Italians call *tarsia* (q.v.), from which it was derived. The most famous French maker of marquetry was André Charles Boulle (q.v.). He was the nephew of Pierre Boulle, who married the daughter of the King's *marqueteur*, Jean Macé, of Blois. On the death in 1672 of Jean Macé after 30 years in the royal service with lodgings at the Louvre, Colbert wrote to the King, who was absent from Paris on a military campaign: "The *ébéniste* who used to make the panels of frogs is dead; he has a son who is not skillful in his profession. A man named Boulle is the most skillful man in France. Your Majesty will ordain, if it pleases him, to which of these he wishes to grant his lodgings in the galleries." Louis XIV replied: "The lodgings in the galleries to the most skillful," which of course meant André Charles. Realizing that the sombre tones of ebony were not satisfactorily softened either by *pietra dura* (q.v.) ornament or by the ivory inlays of Italy and Flanders, he increased the amount of colored ornament and lessened the amount of ebony groundwork, developing especially the art of brass and tortoise-shell inlay. His process was similar to that of wood marquetry, which he also employed extensively. He glued together two sheets of brass, or white metal, upon two sheets of tortoise shell and cut the outline of the design through all the four layers. The result was four replicas of the pattern and four replicas of the ground or matrix. By inserting the metal patterns in the tortoise-shell grounds, and the tortoise-shell patterns in the metal grounds, two complete sets were obtained. The first two, known as *Boulle première-partie*, are preferable, being less shiny and taking the engraving better than when the pattern is in the dark tortoise shell of *contre-Boulle*. Boulle also accentuated salient points of the framework of his furniture with brass and bronze mounts and gilded carving. Splendid examples of his work are the two *armoires* that brought £12,000 at the Hamilton sale, and the marriage coffer at the Louvre, illustrated in color on Plate XL of

Foley's *Decorative Furniture* (London, 1910). An incendiary fire that destroyed his workshops in 1720, with their wonderful collection of furniture, models, and materials, ruined him, so that he bequeathed to his four sons an incubus of debts. Among great French marquetry makers of the eighteenth century are Foulet, Oeben, and Riesener. In the Wallace collection, London, there is a desk once part of the French crown furniture, sold in Holland to Sir William Hamilton, purchased from him in Naples by Sir Richard Wallace, and signed "Riesener fecit," with the date, Feb. 20, 1769. It is similar in design to the famous Bureau du Roi Louis XV in the Louvre, of which there is a copy in the Wallace collection. From the Netherlands, where tarsia flourished during both the sixteenth and seventeenth centuries, it came to England during the reign of William and Mary, and to some extent before. During the Georgian period (see INTERIOR DECORATION; FURNITURE) it was largely supplanted by carving, until the classic revival of the Adam period, beginning about 1760, when it in turn supplanted carving. Consult F. H. Jackson, *Intarsia and Marquetry* (New York, 1903). See FURNITURE.

MARQUETTE, mär-kët'. A city and the county seat of Marquette Co., Mich., 400 miles by rail north of Chicago, on Iron Bay, an inlet of Lake Superior, and on the Duluth, South Shore, and Atlantic and the Munising, Marquette, and Southeastern railroads (Map: Michigan, B 2). The city, noted for its charming scenery, clear and cool atmosphere, and fine buildings and streets, is popular as a summer resort, and is the principal shipping point for the mineral wealth, mainly iron, of the region. It has a fine harbor and regular steamship communication with important lake ports, and its ore docks, well equipped with the latest devices for handling traffic, are among the largest in the world. There are blast furnaces, redstone and trap-rock quarries, chemical works, iron-works, foundries, and machine shops; carriage, sash, door, and blind factories; lumber mills, a wood-alcohol plant, etc. Among the notable structures are the United States Government building, city hall, courthouse, Northern State Normal School, new manual training and high school, opera house, Peter White Public Library, Protestant Episcopal, Roman and French Catholic cathedrals, Catholic Orphanage, St. Mary and St. Luke hospitals, Father Marquette Monument, and the State House of Correction and Branch of State Prison in Upper Peninsula. Presque Isle, a headland of 400 acres north of Marquette, was presented to the city by the Federal government and has been converted into an attractive park. The water works, electric-light plant, power plant, costing \$500,000, a cemetery, electric-supply shop, and a stone crusher are owned by the municipality. Marquette, named in honor of Père Marquette, the French missionary explorer, was settled in 1845, when the rich deposits of iron ore began to be exploited. The first dock was completed in 1854 and a railroad to the mines three years later. The city's subsequent prosperity has been marked. In 1913 it adopted the commission form of government. Pop., 1900, 10,058; 1910, 11,503; 1914 (U. S. est.), 12,117; 1920, 12,718.

MARQUETTE, JACQUES (1637-75). A French missionary and explorer in America. He was born at Laon in France. When 17 he entered the Jesuit Order, and in 1666 was sent

as a missionary to Canada. There his superiors sent him to the country of the Upper Lakes, and in 1668 he founded the Mission of Sault Ste. Marie. In 1673 Marquette, who was then in charge of the newly founded mission at Mackinaw, was instructed to accompany Louis Joliet on his expedition, sent by the Governor, Count Frontenac, to find the Mississippi. Seven men, in two birch canoes, set out on May 17. They went to Green Bay, up the Fox River, the rapids of which they passed by portage, and then on to its source, where guides were obtained from an Indian village. They crossed to the Wisconsin and floated down that stream for a week. On June 17 they entered the Mississippi, on the waters of which another week was passed before they reached a village of Illinois Indians. They passed the junction of the Mississippi and Missouri rivers, and at the mouth of the Arkansas found Indian villages, whose occupants received them with great kindness and no little curiosity. The voyagers continued southward to lat. 33° 40', then, fearing lest they should be made prisoners by the Spaniards, they started on the return trip. On reaching the Illinois River they ascended it, and are supposed to have made the portage from the head of this stream to Lake Michigan, at or near the site of Chicago. After an absence of four months and a voyage in canoes of 2550 miles, they again made Green Bay, in the latter part of September. In October (1674) Marquette obtained permission from his superior to found a mission among the Illinois Indians. With 10 canoes he went to Green Bay, made a difficult portage through the forest to Lake Michigan, and followed the west shore of the lake to the Chicago River, where the party built a hut and passed the winter, as Marquette had become so enfeebled by illness that it was impossible for him to proceed farther. In March he was able to resume the journey. The party crossed the portage to the Illinois River and were most hospitably received at the Indian town of Kaskaskia. Marquette's condition was so serious that his party was forced to turn homeward. They reached Lake Michigan and followed the eastern shore towards Michilimackinac. Marquette did not live to reach his post, dying on May 18, 1675, near a small stream, a little south of that which now bears his name. He was buried in the wilderness, but in 1676 the bones were exhumed by a party of Ottawa converts and carried to the mission of St. Ignace, north of Mackinaw, where they were interred beneath the floor of the chapel. Marquette was a man of singular sweetness and serenity of disposition, and his influence over the Indians was great and beneficent.

MARQUETTE UNIVERSITY. A Roman

Catholic institution for higher education, founded at Milwaukee, Wis., in 1864. The university includes a college of arts and sciences and schools of law, engineering, economics, medicine, dentistry, pharmacy, and music. There is also an academic and a premedical department. The total attendance in all departments in 1914-15 was 1187. Of these 270 were in the academic department; in the college of arts and sciences there were 40; in the school of law 140; in the school of engineering 60; in the school of economics 87; in the school of medicine 140; in the school of dentistry 180; in the school of pharmacy 70; in the school of music 160; and in the premedical department 40. The instructors in various departments numbered 254. The university has no foundation funds, but is entirely dependent on tuition fees and gifts. The medical college has a "Class A" rating from the American Medical Association. The value of the grounds, buildings, and equipment is estimated at about \$800,000. The main library contains about 15,000 volumes and the department libraries about 16,000 volumes. The president in 1915 was James Grimmelmsman, S.J.

MARQUEZ, mär'käs, LEONARDO (c.1820-?). A Mexican general. He served against the United States in the Mexican War, and was a prominent supporter of Santa Anna in the revolutionary movement of 1849. After the fall of that dictator Marquez espoused the cause of Miramon and Zuloaga against Juarez. In 1862 he took up the cause of the French, and rendered important service to the establishment of the power of Maximilian, by whom he was placed at the head of the regular army, and was, in 1864, given the mission to Constantinople. He returned in 1866, and a year later, when the French withdrew, he undertook to organize a native army to support the Empire. In October, 1866, Maximilian made him a division commander and in March, 1867, sent him to Mexico City to form a cabinet and raise troops for the relief of Querétaro. He joined Maximilian at Querétaro, but broke through the besiegers and made his way to Mexico City for the purpose of organizing a force to relieve the Emperor. Finding this impossible, he conceived the plan of setting up an independent government of his own in the Southern States, with Puebla as its capital. He was defeated before he could reach that city and returned to Mexico, where he was besieged by General Díaz. The city was captured, June 21, 1867, and Marquez, after remaining in concealment for several months, made his way to Vera Cruz, and then to Havana. He was expressly excluded from the amnesty of 1870. As a soldier and politician his motives were less marred by personal ambition than those of most of the leaders of Mexican affairs. He was fanatical and cold-blooded in his disregard of human life, receiving the nickname of "The Tiger of Tacubaya" for the wholesale executions which followed one of his guerrilla victories in 1859, though he alleged the express order of Miramon as an explanation. For an account of Marquez's military career consult H. H. Bancroft, *History of Mexico*, vols. v and vi (San Francisco, 1888).

MARQUIS, mär'kwis, or **MARQUESS** (OF. *markis*, *marquis*, Fr. *marquis*, from ML. *mar-chensis*, prefect of a frontier town, from *marcha*, *marca*, from OHG. *marka*, boundary, march). The degree of nobility which in the peerage of England ranks next below duke. Marquises were

originally commanders on the borders or frontiers of countries, or on the seacoast, which they were bound to protect; the German equivalent is *Markgraf*. The first English marquis in the modern sense was Robert de Vere, Earl of Oxford, who was created Marquis of Dublin by Richard II in 1385. The oldest existing marquessate is that of Winchester, created by Edward VI in 1551. See **MARK**.

MARQUIS, măr'kwīs, THOMAS GUTHRIE (1864-). A Canadian author, born at Chatham, New Brunswick, and educated at Queen's University, Kingston, where he graduated in 1889. He was successively English master at the High School, Stratford, and at the Collegiate Institute, Kingston, and principal of the Collegiate Institute, Brockville. Retiring from teaching in 1901, he devoted himself to literature. He was chief editorial writer of the *Ottawa Free Press* (1905); was office editor of *Canada and its Provinces* (1914-15), a series of studies, in 22 volumes, of Canadian history and development. For this work he edited the Pacific Provinces section, and wrote several monographs. His publications include: *Stories of New France* (1890), in collaboration with Agnes Maule Machar (q.v.); *Stories from Canadian History* (1893); *Marguerite de Roberval: A Romance of the Days of Jacques Cartier* (1899); *Canada's Sons on Kopje and Veldt* (1900); *Life of Lord Roberts* (1901); *Presidents of the United States* (1903); *Brook: The Hero of Upper Canada* (1912); *The War-Chief of the Ottawas* (1914); *The Jesuit Missions* (1915). The last two are in the "Chronicles of Canada Series." He also edited *The Builders of Canada* (1903), a collection of biographies of eminent Canadians by well-known writers.

MARRADI, mǎ-rǎ'dê, GIOVANNI (1852-). An Italian poet, born at Leghorn. He was educated at the University of Pisa and afterward studied at Florence. In 1877 he founded, with Severino Ferrari and others, the poetic journal *I nuovi Goliardi*. He is essentially a poet of nature, and especially of the sea. Works: *Canzoni moderne* (1878); *Fantasie marine* (1881); *Canzoni e fantasie* (1883); *Ricordi lirici* (1884); *Poesie* (1887); *Nuovi canti* (1891); *Ballate moderne* (1895); *Rapsodia Garibaldina* (1905). Consult Croce, "G. Marrodi," in *La critica*, vol. iv (Paris, 1906).

MARRAM GRASS. See **AMMOPHILA**.

MARRELLA, mǎr-rêl'ǎ. A crustacean genus that has been recently uncovered in fossil form in the Middle Cambrian shales (Stephen formation) of British Columbia. Its exact taxonomic position is unknown; it is characterized, however, by a subquadratic carapace, two immense posterolateral spines, sessile eyes, and five pairs of appendages on the head. The abdomen has 24 pairs of long, slender, pinniferous legs and the telson is a small plate. The fossils are remarkably preserved, with thin delicate gills and alimentary canals still distinct notwithstanding their great age. See **STEPHEN FORMATION**.

MARRIAGE (OF, Fr. *mariage*, from *ML. maritaticum*, marriage, from *maritus*, husband, from *mas*, male, husband). A union of man and woman, usually for the purpose of *consortium*, or cohabitation, which is sanctioned by the law or custom of the community. The sanction may be moral, religious, or legal. This definition is broader than that of legal usage, which makes marriage only a legal form or the status corresponding thereto; and it is not so broad

as Westermarck's definition, "a more or less durable connection between male and female, lasting beyond the mere act of propagation till after the birth of the offspring." Properly speaking, the mating of animals is not marriage, and in no community of human beings is sexual union regarded as marriage until it is socially sanctioned in some way. On the other hand, communities which can hardly be said to have a positive law not infrequently attach the deepest significance to customary and religious sanctions applied to sexual relations. There has been, however, an unbroken continuity of historical forms, some of which have fallen short of marriage in any true sense, some of which have fallen short of marriage in a legal sense, while others, emerging as civil marriage, have dropped the earlier religious sanctions.

A survey of marriage in its historical evolution discloses the fact that the unions of men and women have not been restricted to the simple mating of one individual with one of the opposite sex which becomes the basis of monogamy. There have been unions of one woman with two or more men (polyandry) and of one man with two or more women (polygyny), and such arrangements have been socially approved.

Distinguished ethnologists have maintained that relatively permanent sexual unions have slowly developed out of an original promiscuity. There is, however, no satisfactory evidence that a state of true promiscuity ever existed among human beings, and the hypothesis is rendered inherently improbable by our knowledge that among the lower animals a distinct progress towards true pairing is observed as we ascend the scale from the lower to the higher vertebrata.

Chief among the facts which suggested the hypothesis of a primitive promiscuity is the widespread custom among uncivilized men of tracing names and descent through the mother instead of the father. It has been shown that the civilized races also, including the peoples of Aryan culture, in all probability passed through this matronymic stage. Furthermore, a sufficient explanation of descent in the female line is found in the general instability of pairing arrangements among primitive men. If a mother with her infant remains with her own kindred, or returns to them, she naturally keeps, and her child takes, her clan name; and her brethren or other near clansmen become the child's natural protectors.

It seems probable that from the first sexual mating among human beings has tended towards monogamic unions, but that permanency of union has been of slow growth. Among the lowest savages, such as the Australians, the Bushmen, the Fuegians, the forest hordes of Brazil, and the Innuits, a mating of one man with one woman for an indefinite, but usually not long period, is the common arrangement.

Nevertheless, in tribes somewhat more advanced but usually dwelling in extreme poverty, various forms of polyandry, or the union of one woman with two or more men, or of a group of women to a group of men, is found in many parts of the world, and undoubtedly prevailed widely in the past. In Tibetan polyandry, so called, the husbands are brothers. In Nair polyandry, or the form which prevails among the Nairs of India, the husbands of a woman may originally have been strangers to one another. Cæsar speaks of a polyandry like the Tibetan as practiced among the Britons. In the Hawaiian

Islands, before they were invaded by whites, a common form was the so-called Punaluan family, in which a number of brothers cohabited with a group of sisters, each man consorting with each woman, and each woman with each man. A conservative explanation of the known facts seems to be that primitive hordes, except perhaps in the most favorable environments, were small, as are the hordes of the lowest savages to-day, and were therefore composed of near kindred commonly marrying in and in. Under such circumstances the cohabiting group may often have been a consanguine family, a Punaluan family, or a family like that created by the Tibetan polyandry. Yet probably from the first a temporary consorting of one man with one woman was the more frequent arrangement. A horde thus marrying in and in is called *endogamous*. Two ways in which a group becomes *exogamous* (taking consorts from other groups) are recognized. Where neighboring hordes, or groups of kindred, live on friendly terms with one another, often participating in common festivities or religious observances, men frequently leave their own kindred and go to dwell with women in another group. They become in such cases in many particulars subject to the male kindred of their wives. Where neighboring groups live on bad terms with one another, frequently engaging in war, captured women may be appropriated by their captors. That wife capture has been a custom in every part of the world is admitted by all ethnologists, and there is a general agreement that the not less widespread custom of wife purchase may have grown out of wife capture. The practice of offering women to actual or potential foes as an act of propitiation probably played a large part in the origin of exogamic custom. The strict rule of exogamy is found only where the clan or gens (see *GENS*) is well developed, and it there is a rule of the clan as such, rather than of the horde or tribe. Where tribes are constituted of clans the clan is exogamous, and the tribe as a rule is endogamous. That is to say, men may not marry their clanswomen, but usually marry women of another clan within the same tribe.

The forms of sexual relationship thus far mentioned, let us now recall, are not necessarily marriages. Any one of them may exist in a community where the only legal union of man and woman, and the only one sanctioned by religion and public opinion, is monogamy. Any one of them becomes marriage through social sanction. There can be little doubt that religious sanctions constituting marriage are older than the legal. To the savage with his belief in imitative and sympathetic magic many things appear dangerous, and he avoids them, making them taboo. In savage communities the sexes are usually taboo to one another until by some ceremony of magic the taboo is broken. The initiation ceremonies, whereby boys and girls at puberty are admitted to certain sexual mysteries, are of this nature. They partially break the sexual taboo. The marriage ceremony is the complete and final breaking. Usually whatever is taboo may safely be touched if first it has been approached in some exceedingly careful way, or partaken of in a homeopathic portion, whereby an immunity is established. Conformably to this idea the sexual taboo is broken by such harmless approaches as the joining of hands or the partaking of a meal together. Some of the most frequent incidents of marriage

ceremony are thus seen to have had their origin in that savage magic which was the first great system of social sanctions, long antedating those which were developed into positive law.

LAW OF MARRIAGE

Historical Development. The law of marriage in all Christian countries is derived from the canon law, i.e. the law established by the Christian Church in the Middle Ages. The canon law drew many of its rules regarding marriage from the Roman civil law, and it was influenced, to some extent, by Teutonic ideas; but in many respects its marriage law was novel. In nearly all Christian countries the canonical rules have been seriously modified during the last four hundred years. The changes which began with the Protestant Reformation were at first worked out by the Protestant churches and embodied in Protestant ecclesiastical law; but a tendency to regulate marriage by civil legislation appeared in the sixteenth century, and at the present day, even in those countries which have adhered most closely to the rules of the canon law, marriage is governed by the ordinary civil law.

Roman Civil Law. Marriage could be established only between Roman citizens, or between Romans and such foreigners as had by treaty the right of intermarrying with Romans (*ius connubii*). Originally, no intermarriage was possible between the gentiles or patricians and the plebeians; and after intermarriage between the orders had been legalized (445 B.C.), gentiles continued to marry, in most cases, within their own order, and often within their own gens. The marriage of near blood relations, however, was forbidden; originally, those related in the sixth degree (e.g. children of first cousins) were not allowed to intermarry. In the third century B.C. marriage was permitted between persons related in the fourth degree (e.g. first cousins). The legislation of the Empire varied: at one time (49 A.D.) a man was allowed to marry his brother's daughter, but in the fourth century this was made a capital offense, and in the fifth century the marriage of first cousins was again for a time prohibited. The relations established by adoption (q.v.) were treated as equivalent to relations of blood kinship. Affinity was a bar in the direct line only, until the end of the third century, when marriage with a sister-in-law (the brother's widow or his divorced wife, and the deceased or divorced wife's sister) was prohibited. Justinian, under the influence of the Christian Church, forbade marriage between godparents and godchildren on the ground that baptism established a spiritual kinship. Under the same influence the Theodosian Code had already prohibited marriage between Christians and Jews.

In the older civil law there were three modes of establishing marital power (*manus*). For the patricians there was a religious ceremony, *confarreatio*; for the plebeians there was fictitious purchase, *cœemptio*, and also prescription, *usus*. The acquisition of marital power by prescription implied that the man and the woman were living together without any preceding ceremony. At an early period this informal union was treated as marriage, even though the prescription was annually interrupted and never became complete. This marriage *consensu*, i.e. by agreement, was usually accompanied by religious observances,

such as the taking of auspices, by a banquet, and by the ceremonial taking of the wife to the husband's house, but none of these things was necessary: *consensus, non concubitus, facit nuptias*. In the course of time the consensual marriage supplanted all other forms except the *confarreatio*, which was occasionally used in some of the old families until the empire became Christian. The consensual marriage was a "free marriage" in two senses: it gave the husband no power over the person or property of his wife, and it was dissoluble at the will of either party.

Marriage could be established when both parties had reached the age of puberty, which was fixed at the completed fourteenth year for males, at the completed twelfth for females. Betrothal (q.v.), *sponsalia*, could take place at any time after the seventh year. When the parties, or either of them, were under paternal authority, no betrothal or marriage was valid without the paternal authorization.

The remarriage of widows was regarded in the older Roman ethics as improper, but it was never legally prohibited. In the later Imperial law it was prohibited for ten months, unless within that period a child had been born. In the later Imperial law, certain property disadvantages were attached to second marriages, both as regarded husbands and wives; but the object was not to penalize second marriages, but to secure the interests of the children of the previous marriages.

Early German Law. The usual form of marriage among the Scandinavians, the Germans proper, and the Anglo-Saxons was wife-purchase. The girl was bought from her father or guardian, and delivered by the father or guardian to the buyer. Abduction of a girl without payment seems to have been regarded as a mode of marriage, but the husband did not obtain complete marital authority until he had paid the customary compensation to the father or guardian. In the earliest written laws the price paid is beginning to be regarded as something that belongs to the woman, not to the father or guardian; it is *dos* or dower in the later English sense—i.e., a provision for widowhood—and instead of paying it over to the father or guardian, the bridegroom gives security for its payment on his death to his widow. In the earliest written laws also the purchase marriage consists of two separate transactions: (1) the agreement between the bridegroom and the bride's father or guardian, in which each formally binds himself to perform his part of the contract, and (2) the delivery of the bride, together with the payment of the price or the giving of security for its payment to the widow. As the formal contract of the old German law consisted in the giving of symbolic pledges, *wadia*, the first of these transactions was a *wadiatio* (Anglo-Saxon, *bewed-dung*), while the second was a "giving" (Anglo-Saxon, *gifta*). The *wadiatio* was more than a betrothal, it was an inchoate marriage. It produced some of the legal results of marriage, while other results attached to the giving, and others again to cohabitation. In the later development of the German law the *wadiatio* was described as *Verlobung* or promising, and consisted in the exchange of promises between bridegroom and bride, and the giving became the *Trauung* or intrusting. *Verlobung*, however, in the German view, was always something more than a Roman betrothal, and the German view

was not without influence upon the development of the canon law.

Roman Canon Law. The Roman Catholic church considers marriage as a sacrament which conveys divine grace to the recipients for the purpose of enabling them to perform well the duties of the conjugal state. This aspect has nothing to do with the validity of the marriage as a civil contract; nor does the Church by this teaching deny that valid marriages are contracted outside its communion. But, considered as a sacrament of the Catholic church, it cannot be received by an unbaptized person, or properly by any one who is in a state of mortal sin. By the general view of theologians, since the consent of the parties is considered the essential part of the sacrament, they are themselves held to be the "ministers" of it: the priest simply adds the Church's benediction. Since marriage was considered a sacrament, it was early asserted that as such its regulation fell within the exclusive jurisdiction of the Church. The claim was recognized; and in the exercise of its jurisdiction the Church developed a uniform law of marriage for all Western Christendom. It did not claim to regulate the property relations of husband and wife, but it regulated the establishment and determined the validity of marriages. The principal inference which the Church drew from the sacramental theory was that marriage was indissoluble. The Church courts could declare that an existing union was not a valid marriage, i.e., they could declare a marriage null, on account of circumstances antecedent to or simultaneous with its establishment; and they could grant a separation from bed and board on account of circumstances that had arisen since the marriage; but they could not dissolve a marriage validly established by reason of any occurrences subsequent to its establishment.

There were numerous grounds on which a marriage could be set aside or annulled, called dividing or destructive impediments (*impedimenta dirimentia*), such as a previous marriage, a previous vow of celibacy, a difference of religion, impotence, etc. To the dividing impediments belonged also relationship within the forbidden degrees. The wide range of this impediment was perhaps the most peculiar feature of the canon law. The Church not only forbade marriage by reason of consanguinity and the legal affinity established by marriage; it attached the same result to the spiritual relationship established by participation in the sacraments of baptism and of confirmation, and to the illegitimate affinity established by unlawful *concubitus*; and it carried prohibitions based on affinity to the same degree as those based on blood kinship. Before 1215 the impediments of consanguinity and affinity extended to the seventh degree, but at the fourth Lateran Council Innocent III limited the prohibition based on consanguinity and affinity to the fourth degree (the seventh by the reckoning of the civil law, e.g., third cousins). From all these impediments of relationship, except those between ascendants and descendants and brother and sister, dispensation might be granted, as also from a vow of celibacy, a difference of religion, and lack of age. Lack of age, moreover, and lack of consent, were curable defects. In most cases, therefore, these dividing impediments did not render the marriages void, but only voidable. The hardships logically resulting from the annulment of marriage were

lessened by the doctrine of the "putative marriage." Where one of the parties to the invalid marriage was unaware of the impediment, that party, and also any children born of the union, were entitled to all the rights which would have been theirs if the marriage had been valid. In particular, the children were legitimate. This doctrine, however, reached over into a field which, even in the Middle Ages, was regarded as secular. The Church could say what was and what was not a marriage, but it could not regulate all the civil results of marriage, nor all the civil results of its annulment.

Other impediments were known as "impeding" or "prohibitive." To this class belonged, for example, a precontract *de futuro* (i.e., a previous betrothal to another person); also the non-observance of ecclesiastical rules regarding banns. Disregard of such impediments subjected the offender to penalties, but did not invalidate the marriage.

It should be noted, however, that the Church's view of betrothal changed in the twelfth century. In the early Middle Ages the Church was strongly influenced by the German idea that betrothal was an inchoate marriage. In the twelfth century it went back to the Roman view that an agreement *de futuro* was a thing wholly distinct from marriage. Nevertheless some concessions were still made to German ideas. It was admitted that an agreement to marry in future and subsequent *concubitus* constituted marriage. Moreover, marriages not consummated were treated somewhat differently from those which had been consummated: they were annulled with more freedom.

On the whole, the canonical marriage was the consensual marriage of the Roman law, made indissoluble. The ages of consent were the same, 14 and 12. It was customary to publish banns, to exchange trothplight at the church door, and to have the marriage consecrated by the priest inside of the church, but none of these things was necessary. The sacrament of marriage was one which the parties could administer to each other, and the clandestine unconsecrated marriage was completely valid. The consent of parents to the marriages of their children, which was required by the Roman law, was not required by the Church, not even in the case of minors. The law was changed, after the Reformation, by the Council of Trent, which decreed that a marriage, to be valid, must be celebrated by the priest of the parish or by some other priest delegated by him for the purpose in the presence of two or three witnesses. This decree, however, was not put in force in all Catholic countries (it is affirmed that it was not introduced into the American possessions of Spain), and where the Tridentine laws are not in force, the Catholic church continues to recognize the secret and unconsecrated marriage.

Protestant Ecclesiastical Law. The Protestant churches of the Continent rejected the sacramental theory of marriage. They regarded divorce as admissible. Luther revived the theory that betrothal was an inchoate marriage, and this view was dominant until the eighteenth century. In order to suppress secret marriages the Protestant churches demanded the consent of parents, or the presence of witnesses, or an ecclesiastical ceremony, or all these things, and before the end of the century it was held that the ecclesiastical marriage was the only perfect marriage; but in the cases where *concubitus* had

occurred after a promise of marriage, it was usual not only to compel the man to go through the religious ceremony, but to "supply" his assent when he refused to give it. The impediments to marriage based on consanguinity and affinity were greatly reduced. Consanguinity was treated as a bar only within the third or fourth degree, affinity only in the direct line. Spiritual kinship was not recognized. There was manifested also a tendency to treat fraud as a ground for annulling marriage, providing it was made clear that but for the fraud the marriage would not have been contracted. Some of these changes were made by civil legislation, but until the nineteenth century legislation was for the most part guided by ecclesiastical opinion.

Modern Continental Legislation. Even in Catholic countries marriage is governed at the present time by civil legislation. The most important innovation of the nineteenth century is the civil marriage. In the eighteenth century publicity of marriage, established in Catholic countries by the Tridentine decrees, was secured in Protestant states in the same way, i.e., by compulsory religious marriage. In some states it was demanded that the rites of the established Church be observed; but exceptions were generally made in favor of the adherents of other confessions or of no confession, first, by permitting marriage to be celebrated according to the forms of any recognized confession, and finally by establishing civil marriage, i.e., marriage before a civil officer. The civil marriage is regularly preceded by notices, posted or otherwise published in the domicile of each of the parties, and the civil officer does not proceed to the marriage until he is satisfied that all the requirements of the law have been observed. At the outset the parties could choose between civil and religious marriage, or the religious marriage was made compulsory only upon members of the state church. Such a choice exists to-day in Austria, Spain, and Portugal. In a larger number of Continental states, however, civil marriage is obligatory. The parties may add a religious ceremony, but the religious marriage has no legal effect. This system obtains in France, Holland, Germany, Switzerland, and Italy.

The age of consent has generally been raised (to 18 and 15 in France, to 21 and 16 in Germany), but not in Spain. The consent of parents or guardians is required for the marriage of minors, and in many legislations the consent of parents is required even after majority. In some of these legislations, the only result attached to parental opposition after majority is to delay the marriage. In Germany, if the opposition of the parents appears unreasonable, the necessary consent can be given by the court. The Roman rule forbidding remarriage of a woman within the ten months following the dissolution of the previous marriage is generally retained in modern legislations. The hindrances based on consanguinity and affinity vary considerably in different states. In Germany consanguinity is a bar only in the direct line and between brothers and sisters; affinity is a bar only in the direct line. In France uncle and niece, aunt and nephew, and brother-in-law and sister-in-law are forbidden to intermarry, but dispensation may be granted by the head of the state. Even in the more conservative Catholic countries there is a tendency to limit the impediments of consanguinity and affinity. In Spain marriages within the fourth degree are pro-

hibited, but for non-Catholics the restriction reaches no further than to first cousins. As regards lack of consent, the doctrines of the canon law are generally followed in the modern civil legislations. Fraud *per se* does not generally invalidate a marriage, but in the German Code fraud by which consent has been induced has this effect.

English Common Law, and Acts of Parliament. That the general ecclesiastical law of Western Christendom prevailed in the British Islands until the Reformation, and that it continued to prevail after the Reformation until changed by Parliamentary enactments, was not seriously questioned by the courts until 1843. In that year the House of Lords decided, in *Queen v. Millis* (10 Clark and Finely, 534), that, even before the Reformation, there was a special ecclesiastical law of England and Ireland, which was not in all points identical with the Roman canon law; that, in particular, the Roman doctrine that parties could contract a valid marriage by consent alone had never been a rule of English ecclesiastical law; that, on the contrary, the assistance and benediction of a priest had always been essential to a perfect marriage in England and Ireland. This decision denied, accordingly, that the form of marriage which is still known in the United States as the "common-law marriage" had ever been a perfect marriage at English common law. The correctness of this decision has been widely questioned, and further historical investigation has strengthened the opposite opinion (see Pollock and Maitland, *History of English Law*, II, 372, and Maitland, *Canon Law in England*). The opposite theory has always been held by the courts of the United States, and the decision in *Queen v. Millis* has not been accepted by the courts of Canada.

The marriage of which the validity was denied in *Queen v. Millis* was an Irish marriage. As far as England was concerned, the question had been settled by the Acts 26 Geo. II, c. 33 (Lord Hardwicke's Act) and 4 Geo. IV, 76, which required a Church marriage preceded by the publication of banns, except when a special license was secured, and which declared any other form of marriage invalid. Church marriage meant marriage according to the forms of the Established church, and from 1753 to 1836 no exceptions were made except in the cases of Quakers and Jews. Lord Russell's Act, 6 and 7 William IV, c. 85, supplemented by Acts 1 Vict., c. 22, and 19 and 20 Vict., c. 119, furnished a choice between marriage according to the forms of the Established church, marriage according to the forms of other registered confessions, and civil marriage before a registrar. Lord Hardwicke's Act further demanded the assent of parents or guardians to the marriage of minors, and the fact that it did not operate outside England led to the numerous "Gretia Green" marriages over the Scottish border. At present, under later acts of Parliament, the same election between various forms of marriage is given in Scotland and in Ireland as in England—an election between religious marriage according to the rites of any recognized confession and civil marriage. In Scotland the formless marriage still exists, as it still exists in the great majority of the commonwealths of the United States. All that is necessary to establish the marriage is the consent or agreement *in presenti*, i.e., an agreement of marriage as distinct from an agreement to marry at some future time.

With the requirement of public marriage in England and Ireland, the canonical rule that an agreement to marry followed by *concubitus* is marriage has been abrogated. In Scotland the rule is maintained. In the United States there is a conflict of authorities. Even at the canon law the rule was based on a presumption that consent *in presenti* had intervened, but this presumption was not rebuttable. Some of the American courts treat the presumption as rebuttable; a few decline to recognize the rule. Of course neither in Scotland nor in the United States will a relation which was originally meretricious be transformed into marriage by a promise to marry; nor was any such result recognized by the Catholic church. In accordance with the common rules, the common-law ages of consent are 14 and 12. If either party, by reason of idiocy, imbecility, or insanity, does not comprehend the nature and effect of the marriage contract, there is no marriage; but if the lack of comprehension is due to intoxication, the marriage is not void, but only voidable. Mistake, as at canon law, must be of such a character that there was really no consent. As regards fraud, the English courts follow the Roman ecclesiastical rule; that fraud *per se* is not a ground for annulling a marriage. As Sir F. H. Jeune said (in *Moss v. Moss*, 1897, P. D. 268), where marriage is said to be annulled for fraud, it is really annulled because of the absence of consent. The American courts, however, are inclined to admit that a marriage may be annulled by fraud, and they are especially inclined to admit such an annulment if the marriage has not been consummated.

In England, as elsewhere, the Reformation brought about a considerable reduction in the prohibitions of marriage based on relationship. Statutes of Henry VIII, repealed in part by a statute of Edward VI and wholly repealed by a statute of Philip and Mary, were partially revived in the first year of Elizabeth's reign; and the provision that survived simply stated that "no prohibition, God's law except, shall trouble or impeach any marriage outside the Levitical degrees." This was interpreted by the ecclesiastical courts to mean that consanguinity and affinity were impediments to marriage as far as the third degree of civil computation. Under this rule a man might not marry his aunt or his niece or the daughter of his deceased wife's sister, but might marry his first cousin. Relationship by the half blood was put on the same footing as that by the full blood, and illegitimate consanguinity was treated as equivalent to legitimate blood relationship. On the other hand, the illegitimate or natural affinity of the canon law, which was affirmed in 28 Henry VIII, c. 7, is held to have disappeared from English law with the repeal of that statute. The courts regarded marriages within the forbidden degree as voidable rather than void, but such marriages were declared void by Act of 5 and 6 William IV (1835). Repeated efforts to legalize marriage with the deceased wife's sister were finally crowned with success in 1907. In all the British colonies the prohibitions based on collateral affinity have been removed.

As to proof of marriage, the common law admits any evidence of matrimonial consent. Where a formal marriage, religious or civil, has taken place, it is presumed, until the contrary is shown, that the parties were able to marry, that their consent was complete and free, and

that all necessary forms were observed. If no formal marriage has taken place, or none is proved, the fact that the parties have lived together as husband and wife, have acknowledged themselves, or have been generally reputed, to be husband and wife, raises a presumption of marriage. This presumption, however, is invalidated if it can be shown that the relation was illicit in its origin.

It is a peculiar feature of the English and American common law that it gives an action for damages for breach of contract to marry. See BREACH.

Foreign Marriages. The question whether and under what conditions a court of law will recognize as marriage a union established in another jurisdiction is a question of conflict of laws (q.v.). The general rule, all over the civilized world, is that if the forms required where the marriage was established have been observed, the marriage will be recognized as formally perfect everywhere. The capacity of parties to marry is determined, according to the prevailing European theory, by the law of their domicile, and the English courts now follow this rule. In some of the European states, however, capacity to marry is determined by the law of the country of which the person is a citizen or subject, whether he or she be domiciled there or elsewhere. In the United States the courts follow the older English decisions, according to which the capacity of the parties to marry, as well as the sufficiency of the forms observed, is determined by the law of the State in which the marriage takes place: so that citizens of any State can escape the restrictions imposed by their own State by simply crossing the line into a jurisdiction where those restrictions are not imposed.

Statutory Rules in the United States. Lord Hardwicke's Act did not apply to the Colonies, and never became a part of the common law of the United States. In nearly all of the United States, however, statutes have been enacted providing for a ceremonial marriage, and in most cases requiring also a license to marry granted by the properly constituted officer, usually the clerk of the municipality where the marriage is solemnized or the officer having supervision over vital statistics.

The marriage ceremony is usually required to be performed in the presence of two or more witnesses, by a priest or clergyman of some church, or by certain enumerated civil officers, such as judges of courts of record, justices of the peace, police justices, mayors, aldermen of cities, and county clerks. Various penalties are imposed for failure to comply with the provisions of the statute, and in some States intentional violation of the law is made a criminal offense. In most States, in the absence of a positive provision of the statute that marriages not complying with the requirements of the statute shall be void, the statute is deemed to be directory only, and not in any manner to affect the validity of the so-called common-law marriage. This is substantially the law in all of the States except California, Illinois, Kentucky, Missouri, Maryland, Massachusetts, North Carolina, Vermont, Washington, and West Virginia, in all of which it is held that the common-law marriage has been abolished by statute. But in some of these States, notably Massachusetts, Washington, and West Virginia, there are validating statutes providing that mere irregularities when an at-

tempt is made in good faith to comply with the statute shall not affect the validity of the marriage.

A statute of New York, passed in 1901, requires a nonceremonial marriage to be evidenced by a written agreement to be entered into in the presence of two witnesses and acknowledged in the same manner as conveyances of real estate. It would seem that this statute does away with common-law marriage in New York.

In many of the United States the age at which an infant may consent to marry has been raised by statute to 16 and in some of the States to 18 years. These statutes do not, however, change the common-law rule that such marriages are not void, but *voidable* only at the option of the infant or of his parent or guardian. See INFANT.

In Connecticut and Minnesota epileptics and feeble-minded persons are not allowed to marry, and several States have somewhat similar statutes. Michigan prohibits the marriage of persons afflicted with venereal disease. Twenty-five States prohibit marriage between whites and persons of negro descent, four States between whites and Indians, and five States between whites and Chinese. In 17 States the marriage of first cousins is forbidden.

Bibliography. On the history of marriage as an institution, consult: E. A. Westernmark, *The History of Human Marriage* (3d ed., New York, 1902); G. E. Howard, *A History of Matrimonial Institutions* (Chicago, 1904); Charles Letourneau, *The Evolution of Marriage and of the Family*, translated from the French (New York, 1911). MARRIAGE À LA MODE, à la mōd. A series of six paintings by Hogarth (1744) in the National Gallery, London, intended as designs for a series of engravings, as which they are most widely known. They show the results of a fashionable marriage between the son of an earl and the daughter of a rich London alderman, in subjects as follows: I. The Marriage Contract; II. After the Marriage (see illustration under HOGARTH); III. Visit to the Quack Doctor; IV. The Countess's Dressing Room; V. The Duel and Death of the Earl; VI. Death of the Countess.

MARRIAGE AT CANA. A favorite subject of Italian painters, especially of the Venetian school. The most celebrated examples are those by Paolo Veronese in the Louvre (1563) and by Tintoretto in Santa Maria della Salute, Venice. The former, one of the largest easel pictures in the world, contains over 130 figures, many of which are portraits of contemporary rulers and celebrities. It represents an elaborate Venetian feast, with rich architectural background. Other examples of this subject, which was a favorite one with Veronese, are in the Dresden Gallery and the Brera, Milan. In Tintoretto's "Marriage at Cana" the table is set lengthwise in a large hall, with Christ at the farther end and guests along both sides, a remarkable piece of foreshortening. Other large canvases of the same subject are by

Moretto da Brescia at San Fermo and by Scarsellino in the Ferrara Gallery.

MARRIAGE SETTLEMENT. In the English law of real property a trust of real estate created for the purpose of securing to a wife a separate interest therein for her life free from the control of her husband. Such settlements were devised to protect the wife's property rights from the absolute control which was by the common law vested in the husband. This end was attained by conveying the land to trustees for the sole and separate use of the wife usually for life, though sometimes in fee. As the term 'settlement,' as a term of conveyancing, signified a conveyance of property to be held and enjoyed by two or more persons, as mother and child or children, in succession, a marriage settlement came to denote such a conveyance made to, or for the benefit of, a woman on her marriage, with remainder to her child or children, and this irrespective of whether the wife's estate was legal, and so subject to the husband's control, or equitable and as such free from his control. A marriage settlement is usually made in anticipation of a contemplated marriage, in which case it is known as an antenuptial settlement, but postnuptial settlements are also common. See HUSBAND AND WIFE; SEPARATE PROPERTY; SETTLEMENT.

MARRIED WOMAN. See HUSBAND AND WIFE; MARRIAGE; DOWER; SEPARATE ESTATE.

MARRIOTT, JOHN (1780-1825). An English poet. He was the son of Robert Marriott, rector of Cotesbach Church in Leicestershire, and was educated at Rugby and at Christ Church, Oxford (B.A., 1802; M.A., 1806). He left Oxford in 1804 to become tutor to George Henry, Lord Scott (died 1808), elder brother of the fifth Duke of Buccleuch. While living at Dalkeith (1804-08) he made the intimate acquaintance of Sir Walter Scott. Ordained priest in 1805, he received from the Buccleuch family the rectory of Church Lawford in Warwickshire. Though he retained this benefice till his death, he resided mostly in Devonshire, serving in various curacies. To the third edition of Scott's *Minstrelsy* he contributed three poems. Marriott's best-known poem is "Marriage is Like a Devonshire Lane" (in Joanna Baillie's *Collection of Poems*, 1823). He also wrote several popular hymns, as "Thou whose Almighty Word."

MARRONS GLACÉS, mǎ'rōn' glǎ'sǎ'. See CHESTNUT.

MAR'ROW (AS. *mearg*, *nearh*, OHG. *marag*, *marg*, Ger. *Mark*; connected with Welsh *mer*, Corn. *maru*, OChurch Slav. *mozgŭ*, Av. *mazga*, Skt. *majjan*, marrow, from *majj*, Lat. *mergere*, to dip). A substance filling the cells and cavities of the bones of mammals. There are two varieties, which are known as *red marrow* and *yellow marrow*. In some of the short bones, as the bodies of the vertebrae and the sternum, the marrow has a reddish color, and is found on analysis to contain 75 per cent of water, the remainder consisting of albuminous and fibrinous matter, with salts and a trace of oil. In the long bones of a healthy adult mammal the marrow occurs as a yellow, oily fluid, contained in vesicles like those of common fat, which are embedded in the interspaces of the medullary membrane, a highly vascular membrane lining the interior of the bones. This marrow consists of 96 per cent of oil and 4 of water, connective tissue, and vessels. The capillary blood vessels are very abundant, and in those of red marrow

the red corpuscles of the blood are constantly recruited. The oily matter of the marrow is composed of the same materials as common fat, with the oleine (or fluid portion) in greater abundance. Being of low specific gravity, it is well suited to fill the cavities of the bones and forms an advantageous substitute for the bony matter which preceded it in the young animal. Preparations of red bone marrow are in the market, for internal administration. They are useful in anæmia, when given with other reconstructives.

MARROW CONTROVERSY. One of the memorable struggles in the religious history of Scotland. It took its name from a book entitled the *Marrow of Modern Divinity*, published at Oxford in 1645. The authorship of the book has been attributed, though probably incorrectly, to Edward Fisher. The high evangelical character of this work, and especially its doctrine of the free grace of God in the redemption of sinners, had made it a great favorite with certain of the ministers of the Church of Scotland, and in 1718 an edition was published in Edinburgh by the Rev. James Hog of Carnock, followed in 1719 by an explanatory pamphlet. A committee appointed by the General Assembly of the same year, after an examination, drew up a report which was presented to the Assembly of 1720, and the result was the formal condemnation of the doctrines of the *Marrow*, a prohibition to teach or preach them for the future, and an exhortation to the people of Scotland not to read them. This act of the Assembly was immediately brought by Thomas Boston before the presbytery of Selkirk, who laid it before the synod of Merse and Teviotdale. The evangelical ministers in the Church, few in number, but supported by a very considerable amount of popular sympathy, resolved to present a representation to the next General Assembly (1721) complaining of the late act and vindicating the "truths" which it condemned. A commission of the Assembly of 1721 was appointed to deal with the ministers, and a series of questions was put to them, to which answers were drawn up by Ebenezer Erskine and Gabriel Wilson. These replies did not prove satisfactory, and the "Marrow-men" were called before the bar of the Assembly (1722) and solemnly rebuked. The matter was then quietly dropped, but it really occasioned the secession of 1734. See BOSTON, THOMAS; ERSKINE, EBENEZER.

MARRUCINI. An ancient people in central Italy, on a narrow tract of land along the right bank of the river Aternus, now the Pescara. Their territory extended from the Apennines to the Adriatic; it lay between the Vestini on the northwest and the Frentani on the southeast, and between the Peligni on the southwest and the Adriatic on the northeast. They were an independent nation, said to be descended from the Sabines, and generally were in alliance with their neighbors, the Marsi and the Peligni. They entered into alliance with the Romans in 304 B.C., but rebelled at the beginning of the Social War. Their only place of importance was Teate, now Chieti, on the right bank of the Aternus. From an inscription, of about 250 B.C., known as the Bronze of Rapino, written in the Latin alphabet, but in an Oscan dialect, something is known of the dialect of the Marrucini. See ITALIC LANGUAGES, *Marrucianian*; and consult R. S. Conway, *The Italic Dialects* (Cambridge, 1897).

MARRYAT, măr'ri-ät, FLORENCE (1837-99). An English authoress, daughter of Captain Marryat. She was born at Brighton, July 9, 1837, educated at home, and began writing at 12. She was twice married, first to Col. Ross Church, of the Madras Staff Corps, and second to Col. Francis Lean, of the Royal Light Infantry. She died in London, Oct. 27, 1899. As a writer she first gained public attention by *Love's Conflict* (1865). Miss Marryat was also known as a lecturer, an operatic singer and a comedienne. In collaboration with Sir C. L. Young she wrote *Miss Chester*, a three-act drama, and in 1881 she acted the principal comedy rôle in her own play, *Her World*. Her books, fiction and miscellaneous, number some 70, none of them, probably, destined to be long remembered. Her *Life and Letters of Captain Marryat* (1872) should, however, be mentioned.

MARRYAT, FREDERICK (1792-1848). An English sailor and novelist, born in London, July 10, 1792. On leaving school he entered the navy as midshipman. In 1812 he attained his lieutenancy. In 1814 he was fighting on the American coast. His health gave way and he went home. He was made commander in 1815. In 1820 he was in the sloop *Beaver* on the St. Helena station. After an able service he resigned in 1830. During his naval career Marryat saved at great personal risk more than a dozen lives. He was rewarded on this score by a medal from the Royal Humane Society; and he was elected a fellow of the Royal Society in 1819, mainly because he had adapted Popham's signal system to the mercantile marine. He was also decorated by the King of France for "services rendered to science and navigation." Marryat wrote easily and made money quickly, but he was somewhat lavish, and towards 1844 was in straitened circumstances. Upon the Admiralty's refusal to let him reënter the service he burst a blood vessel, and six months later, when almost well, he was mortally shocked by hearing that his son Frederick had been lost in the *Avenger*. He died Aug. 9, 1848, at Langham. Among his numerous tales are the avowedly autobiographical *Frank Mildmay* (1829); then *Peter Simple* (1834); *Mr. Midshipman Easy* (1836); *The Phantom Ship* (1839); *Poor Jack* (1840); *The Privateer's Man* (1846). Consult Florence Marryat, *Life and Letters of Captain Marryat* (London, 1872), and David Hannay, *Life* (ib., 1889).

MARS (Lat., also *Marmar*, *Mavors*, or *Marspiter*, like Jupiter, Gk. *Ἄρης*, *Arēs*, of unknown derivation). Among the ancient Greeks and Romans the god of war and tumult of battle. The Greek and Roman conceptions differ radically.

Greek. Ares, though prominent in the poets, plays no large part in Greek cult or myth. It is true that a somewhat long list can be compiled of temples of the god, but he did not fill a large place in religious thought, and at but few localities was his worship important. At Thebes and Athens he seems to have been more prominent than in other communities. At Thebes he was said to have been father of the dragon who guarded his sacred spring and was slain by Cadmus (q.v.), who in the final reconciliation wedded Harmonia, daughter of Ares and Aphrodite. Here, as often in Greek legend, Aphrodite appears as the recognized consort of Ares. The connection of Aphrodite with Hephaestus, and her adultery with Ares, though told in the *Odyssey*, book viii, was not everywhere canonical,

and seems to have received its chief prominence at a late period. At Athens there was a celebrated temple of Ares, with a statue of the god, by Alcámenes, and a legend which connected him with the founding of the court of the Areopagus. (See the articles *AREOPAGUS*; *VENUS*.) He was said to have killed a son of Poseidon for an outrage on his daughter, and to have been tried by the 12 gods and acquitted on this hill, which henceforth, the Greeks said, bore his name. Cults of Ares in Thessaly and at Argos, Tegea, and Sparta are also mentioned. In legend Ares is commonly the son of Zeus and Hera, whose quarrelsome disposition he inherits. His sister in Homer is *Eris*, his sons *Deimos* (Terror) and *Phobos* (Fear), who go with him into battle. He is always greedy for war, battle, and bloodshed. The tumult of battle is his delight, and in later poets, as Sophocles, he appears as the sender of pestilence and destruction. In the Trojan War he fought with the Trojans, but he yielded to Athena, the champion of the Greeks, and was even wounded by Diomedes. He was certainly closely associated in the minds of the Greeks, from Homer onward, with Thrace, and there is, to many scholars, probability in the view that his worship was derived from Thracian tribes or their kindred. Another view, supported by O. Gruppe, emphasizes the importance of Ares in Boeotian story and cult, and holds that his worship was carried thence to Thrace. In the earlier art, especially on vases, Ares is often bearded and regularly wears the full armor of a Greek soldier. In the fifth century and later this equipment disappears and the god is often represented clad in the chlamys, or nude, though usually with his attributes of shield and spear. Among the most celebrated statues are the standing "Ares Borghese" (sometimes called Achilles) in the Louvre, which goes back to a fifth-century work, and the seated "Ares Ludovisi" in Rome, which seems to be copied from a statue by Scopas (q.v.), or, according to some, from a statue by Lysippus (q.v.), though the Erotes are probably the addition of the Hellenistic copyist. Consult: O. Gruppe, *Griechische Mythologie und Religionsgeschichte*, vol. ii (Munich, 1906); A. Fairbanks, *The Mythology of Greece and Rome* (New York, 1907); the article "Ares," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

Roman. Mars was an ancient Italian deity, worshiped in all parts of central and southern Italy. To some scholars he seems everywhere to have been the god of war; others think he was originally a god of vegetation. To early peoples agriculture and war are of prime importance; both long remained of prime importance to the Romans. At Rome his worship is among the most ancient and the most important. His temple and oldest altar stood in the Campus Martius; and another famous temple was just outside the Porta Capena, to the south of the city. At each *lustrum* at the close of the census, when the *comitia centuriata*, or Roman citizens as an army, gathered in the Campus Martius (see *CENSOR*; *COMITIA*), the gathering was purified by leading around it the *suovetaurilia* (boar, ram, and bull), an offering sacred to Mars, which was afterward sacrificed, and similar ceremonies are found in connection with other purifications, as of the city, villages, and even single farms. (See *AMBARVALIA*.) The sacred emblems of Mars were the spear and shield, said to have

fallen from heaven, which were preserved in the Regia and were carried by the Salii (q.v.), priests of the god, in their festivals. The chief festivals of Mars were in the months of March (called Martius, from the god) and October, which are clearly connected with the opening and close of the campaigning season. In legend Mars was the father by Rhea, or Rhea Silvia (q.v.), of Romulus and Remus. The wolf, a warlike beast, was sacred to Mars. So too, to some extent, were horses, which the Romans bred mainly for military purposes; the March festival in honor of Mars was known as the Equiria, and included horse racing. Augustus built in his forum a splendid temple to Mars Ultor (Mars the Avenger), because the god had helped him to avenge the death of his uncle and father by adoption, Julius Caesar. See *AUGUSTUS*, *FORUM OF*. Consult: W. W. Fowler, *Roman Festivals* (London, 1899); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1911); and the article "Mars" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MARS. The first of the superior planets. Its mean distance from the sun is 141.5 million miles, or nearly $\frac{2}{3}$ times that of the earth; its periodic time, 686.98 days; its diameter, 4230 miles; volume, $\frac{1}{81.7}$ that of the earth; density, 0.71, earth's being unity. Its orbit is inclined at an angle of $1^{\circ} 15' 1''$ to the ecliptic, and, with the exception of the orbit of Mercury, has a greater eccentricity, viz., 0.09332, than that of any other major planet. When it is nearest to the earth (i.e., in favorable opposition) its apparent angular diameter is $25''$, but when farthest away (i.e., in conjunction) its diameter is not more than $4''$. The axis of rotation is inclined $24^{\circ} 50'$ to the plane of the orbit and therefore the planet presents phenomena of seasons similar to the earth's. The diurnal rotation period of Mars is known very accurately from observations of surface markings to be 24 hours, 37 minutes, 22.67 seconds. The planet shines with a red light and is a brilliant object in the heavens at midnight when near opposition. Mars has two satellites, discovered by Hall in 1877. They are very small, and visible with powerful telescopes only. The inner satellite, Phobos, revolves around the planet at a distance of only 3760 miles from its surface in 7 hours, 39 minutes, which is less than one-third of the Martian day. Consequently, Phobos will rise in the west and set in the east, its real motion more than counterbalancing the apparent diurnal motion of Mars on its axis. The outer satellite is called Deimos; its period is 30 hours, 18 minutes, and its distance from the surface of its primary is 12,500 miles.

Beginning with the telescopic researches by Sir William Herschel, Mars has possessed special interest owing to the indication of the existence upon its surface of physical conditions not unlike those of the earth. The Martian seasons have already been mentioned. The "canal system" of Mars, suggested by Schiaparelli in 1877, has given rise to a careful study of the planet, rendered possible by the construction of our great modern telescopes. Many things seem to indicate that Mars is enveloped in an atmosphere with physical properties similar to those of the earth's atmosphere. According to observations by Lowell, at Flagstaff, Ariz., carried on for six months, this atmosphere would appear to be of remarkable clearness. Two white patches, in the

neighborhood of the poles, are very conspicuous and so brilliant that they, in the proper light of the sun, have been seen sparkling like stars. They are generally explained as accumulations of snow and ice, and this view is supported by the fact that they change with the Martian seasons.

A mixture of orange patches and gray-green markings is seen extending over more than half the surface of the planet in a central zone, almost parallel to the equator. The orange patches are assumed to be land. This assumption is based upon the similar appearance that the great deserts of the earth would present under the same conditions. Also permanent markings on these patches have been observed. The gray-green markings were at first explained to be seas and Sir William Huggins discovered water in the atmosphere of Mars, but the observations of Douglas in Arizona (1894) and Barnard at the Lick Observatory (1896) seem to disprove the aqueous character of the "seas." In 1894 Lowell and Pickering discovered, a month after the Martian vernal equinox, a dark belt connected with the south polar cap, which was explained by them as a gathering of water resulting from the melting of the cap by the summer heat. A similar appearance has been observed around the north polar cap.

Of all the markings that have been observed on the surface of Mars the "canals" have created the most interest. Since their first observation at the very favorable opposition of the planet in 1877 they have been studied carefully at later favorable oppositions. They have been described by observers as faint lines, becoming finer and straighter at closer observation, following the course of great circles, and distributed like a network over the surface of the planet. Several appear to pass through the same point, at which round spots, called lakes, are seen. Various theories have been advanced for the explanation of this "canal system." They were first taken to be waterways, and the change in their appearance was explained as due to the Martian seasons. Pickering considered them to be tracts of land rather than waterways. Lowell advanced the view that these "canals" and "lakes" constituted a system of irrigation carried out by the inhabitants of Mars for the purpose of leading the water obtained from the melting snow of the polar regions over the surface of the planet. It has been urged that the appearance of the canal system may be nothing but an optical illusion, but Lowell in 1905 obtained photographs which seem to settle decisively the question of the reality of the canals.

MARS, mäs, ANNE FRANÇOISE HYPOLYTE BOUTET, MADEMOISELLE (1779-1847). A famous French actress. She was born in Paris. Her father was the actor Jacques Monvel; her mother

was an actress, Mademoiselle Mars-Boutet. At an early age she appeared at the Comédie Française in personations of ingenuous childhood, but it was not till she had reached her twenty-fourth year that her first great success was obtained in *L'Abbé de l'épée*, in the part of the deaf and dumb girl. From that time forward, through a period of nearly 40 years, she acted through the whole range of dramatic art with a fullness of talent that never failed to present with delicacy, power, and good taste each new character in which she appeared. She was especially celebrated for her work in the ancient and classical repertory. Her last appearance was in 1841 as Célimène in *Le misanthrope* and as Araminthe in *Les femmes savantes*. She died in Paris on March 20, 1847. Her sister, Mars aînée, was also a well-known actress. Consult, though they are of doubtful value, the *Mémoires de Mademoiselle Mars* (Paris, 1849) and the *Confidences de Mademoiselle Mars* (ib., 1855), published by Roger de Beauvoir.

MARS, FORUM OF. A name for the Forum of Augustus. See AUGUSTUS, FORUM OF.

MARSALA, mär-sä'lä. A city in the Province of Trapani, Sicily, 102 miles by rail southwest of Palermo (Map: Italy, D 6). Though it has ruins of its ancient walls, a castle, and several fine churches, it is modern in appearance. Marsala has a Gymnasium, a technical school, an agricultural school, a city library, and a theatre. It is famous for Marsala wine, which is made by building up other wines of Sicily. The exports are wine, salt, soda, grain, and oil. Pop. (commune), 1901, 57,567; 1911, 65,451. It is on the site of the ancient Lilybæum.

MARS'BANKER, MARSH'BANKER, etc. (Dutch *marsbanker*, sead, apparently from *mars*, peddler's pack, or *mas*, crowd + *bank*, bank; so called because the fish appears in shoals). Old or local names of the menhaden (q.v.). Compare MOSSBUNKER.

MARSCHALL VON BIEBERSTEIN, mär-shäl fön bë'bër-shtîn, ADOLF, BARON (1842-1912). A German statesman and diplomat, born in Karlsruhe and educated at Heidelberg and Freiburg. He entered the judicial service of Baden, and from 1875 to 1883 was a member of the Upper House of its Parliament. In the Imperial Diet, from 1878 to 1881, he allied himself with the German Conservatives. In Baden he made a strong effort to unify Protestant opposition to the Ultramontanists; and his activity in the Empire was largely in paving the way for social reforms. After four years as Secretary of State for Foreign Affairs, an office in which he devoted himself especially to commercial treaties, he was named Prussian Minister of State in 1894. Upon his retirement in 1897 he was sent as Ambassador to Constantinople. In May, 1912, he accepted a similar position in London, but died five months later. He was recognized as Germany's ablest diplomat and was largely instrumental in influencing the Turkish government in favor of German policies.

MARSCHNER, märsh'nër, HEINRICH (1795-1861). A German composer, born at Zittau in Saxony. In 1813 he entered the University of Leipzig to study law, but soon abandoned it in favor of music. He met Beethoven in 1817, through the medium of his patron, the Count von Amadée, and in 1823 shared with Weber the directorship of the German and Italian operas at Dresden. He succeeded Weber as kapellmeister of the Leipzig Theater, and produced on its stage

his popular opera *Der Temppler und die Jüdin* (1829), which made him famous throughout Germany. *Heinrich IV und D'Aubigne* had appeared in 1819 (produced by Weber in 1820), and *Der Vampyr* (regarded as his best work) in 1828. His compositions also include a great number of songs, pianoforte pieces, part songs, and choruses, and considerable chamber music. Other operas, not mentioned above, are: *Hans Heiling* (1833), a remarkable work: *Der Bābu* (1837); *Adolph von Nassau* (1843); *Hjarne der Sāngerking* (1863), reproduced in 1883 as *König Hjarne und das Tyrfinngschwert*. He was kapellmeister to the King of Hanover (1831-59). His music belongs to the romantic school of Weber, whom he greatly resembled in style, although in a way his ideals leaned towards the style of Wagner. His operas had a great vogue in Germany, and still remain in the repertoire of most of the provincial theatres. He died in Hanover. Consult: G. Münzer, *Heinrich Marschner* (Berlin, 1901); M. E. Wittmann, *Marschner* (Leipzig, 1905); H. Gaartz, *Die Opern Heinrich Marschners* (ib., 1912).

MARSDEN, märz'den, SAMUEL (1764-1838). An English missionary. He was born at Horsforth, near Leeds, July 28, 1764; was educated at the free grammar school at Hull, and began life as a tradesman at Leeds. He joined the Methodists, but, desiring to obtain a collegiate education, entered the English church; studied at St. John's College, Cambridge, and was ordained in 1793, and in 1794 sailed as chaplain to the penal colony at Parramatta, near Sydney, Australia. Receiving a grant of land and 13 convicts to till it as part payment for his services, he made it the model farm in New South Wales, and devoted the profits from it to the support of schools and missions. A mutinous spirit showing itself among the convicts, Marsden sailed for England (1807), mainly for the purpose of obtaining permission for the friends of the convicts to accompany them to the penal colony. This was refused, but his proposal that the convicts should be taught trades was well received. Having had some intercourse with the Maoris of New Zealand, and found them to be superior to the Australian natives, he endeavored, while in England, to obtain funds for the formation of a mission among them and missionaries to accompany him. Two laymen, William Hall and John King, consented to go as pioneers, and accompanied Marsden to Australia, August, 1809. They were soon followed by Thomas Kendall, and the party finally went to New Zealand in 1814. He employed these teachers in laying the foundations of a Christian civilization, frequently visited them, and in his fourth visit took with him the Rev. Henry Williams, who afterward became Bishop of a Maori district. He procured reinforcements for the mission from the English and Wesleyan churches, induced the natives to adopt a fixed form of government, provided for the preparation of a grammar and dictionary of the Maori language, and lived to see the people Christianized. He died at Windsor, May 12, 1838, and was buried in his parish at Parramatta. Consult J. B. Marsden, *Life of Samuel Marsden* (London, 1859).

MARSDEN, WILLIAM (1754-1836). A British Orientalist, son of a Dublin merchant, born at Verval, Ireland. In 1771 he was appointed to the civil service of the East India Company at Bencoolen, Sumatra, became secretary to the government, and acquired a thorough knowledge

of the Malay language. Having received a pension, he returned in 1779 to England, where he devoted himself to literature and published a *History of Sumatra* (1783). In 1807 he retired to private life and study, in 1812 published his *Grammar and Dictionary of the Malay Language*, and in 1818 a translation of *Marco Polo* (new ed., 1880). In 1834 he presented to the British Museum his collection of 3447 Oriental coins, and in 1835 his library of Oriental books and manuscripts to King's College. He published also *A Grammar of the Malayan Language* (1812) and *Numismata Orientalia* (1823).

MARSEILLAISE, mär'se-lāz'; Fr. pron. mär'sē'yāz'. The hymn of the French Revolution and since then the anthem of freedom in all European movements of liberation. In April, 1792, when a column of volunteers was about to leave Strassburg, the mayor of the city, Diedrich, gave a banquet on the occasion and asked an officer of artillery named Rouget de Lisle (q.v.) to compose a song in their honor. Rouget wrote the words during the night, adapting the music probably from the Oratorio *Esther*, by Jean Baptiste Lucien Grison, and calling it the *Chant de guerre de l'armée du Rhin*. On the following day it was sung with rapturous enthusiasm, and instead of 600 volunteers, 1000 marched out of Strassburg. The whole Army of the North soon took up the song. In Paris the song was unknown till the Marseilles battalion brought it to the city and sang it at the storming of the Tuileries. It was received with enthusiasm by the Parisians, who—ignorant of its real authorship—named it *Hymne des Marseillais*, which name it has ever since borne. The last and most pathetic strophe, the *strophe des enfants*, was not written by Rouget de Lisle, but was added later.

The following is the first stanza, with refrain, approved in 1887 by a commission appointed by the French Minister of War to determine the exact form of the song:

Allons enfants de la patrie,
Le jour de gloire est arrivé!
Contre nous de la tyrannie
L'étendard sanglant est levé (bis).
Entendez-vous dans ces campagnes
Mugir ces féroces soldats?

Ils viennent jusque dans nos bras
Egorger nos fils, nos compagnes.
Aux armes, citoyens!
Formez vos bataillons!
Marchons, marchons! qu'un sang impur
Abreuve nos sillons!

MARSEILLE, mär'sā'y', FOLQUET DE. See FOLQUET DE MARSEILLE.

MARSEILLES, mär-sälz' (Fr. **MARSEILLE**, mär'sā'y'). The principal seaport of France, the second city of the Republic in point of population; capital of the Department of Bouches-du-Rhône, and an important military and naval station. It is on the eastern shore of an inlet of the Gulf of Lyons, 25 miles east of the principal mouth of the Rhone and 534 miles by rail southeast of Paris; lat. 43° 17' N., long. 5° 23' E. (Map: France, S., K 5). Its location is picturesque, the ground rising on all sides in an amphitheatre of wood-crowned hills 1200 to 1800 feet high, which terminate in a steep promontory a few miles south of the city. The immediate surroundings were formerly arid, but since the completion of the canal bringing the waters of the Durance to the city the adjoining district has been irrigated and is now covered with gardens.

Few European cities have shown such rapid modern development. A century ago the town was a cluster of narrow, crooked streets grouped around the cove which formed the old harbor. Several large avenues now traverse this old portion, while practically the whole city is laid out with broad and straight streets and generally presents a modern aspect. The city is dominated by the hill of Notre Dame de la Garde, which rises to a height of 480 feet on the southwest, between the town and the shore. This hill is encircled on the water side by a picturesque road, the *Chemin de la Corniche*, which leads southward along the shore of the gulf to the *Anse des Catalans*, a distance of $4\frac{1}{2}$ miles. There is a citadel on a promontory guarding the narrow entrance to the old harbor, which as a land-locked cove reaches into the heart of the city. The harbor is also defended by the fortified islands of Ratonneau and Pomégue, and the *Château d'If*, the latter a former state prison immortalized by Dumas in his *Monte Cristo*. Two principal avenues crossing at right angles divide the city into four quarters. One is the *Rue Cannetière*, the principal business street, which begins at the head of the old harbor and is continued eastward as the *Boulevard Madeleine*. The other, running north and south, is the *Rue de Rome*, which terminates at the obelisk in the *Place Castellane*, whence it is prolonged as the *Prado*, the principal boulevard of Marseilles. This is a magnificent avenue with two double rows of trees, which runs 2 miles south and southwestward, terminating on the seashore at *Parc Borély*. The old town is still a labyrinth of narrow streets inhabited by a seafaring population.

Marseilles has few architectural monuments and no interesting remains of ancient times. It is an episcopal see and its most prominent building is the new cathedral, the finest modern cathedral of France, which faces the southern basin of the new harbor. It is built of Florence greenstone in the Byzantine style mixed with Romanesque and classic elements, and is surmounted by five domes. Another church worthy of notice is that of Notre Dame de la Garde, built (1853-64) on the hill of that name south of the old harbor. Its belfry, surmounted by a colossal statue of the Virgin, towers nearly 600 feet above the level of the sea and affords a splendid view of the city and the surrounding country. Among secular buildings should be mentioned the *Palais de Longchamp*, a magnificent Renaissance building containing various museums, the *Palais de Justice*, and the *Exchange*. The educational institutions of the city include a school of medicine and pharmacy and a faculty of sciences, which form part of the University of Aix-Marseilles, a school of engineering, a school of navigation, an independent law school, two lycées, two seminaries, a commercial high school, a school of fine arts, a conservatory of music, an astronomical observatory, botanical and zoölogical gardens, a biological laboratory, museums of art, archaeology, and natural history, and a municipal library of 120,000 volumes. Besides these there are a number of scientific and literary societies. The water supply is derived from the River *Durance* through the Canal de Marseille, constructed 1837 to 1848, which delivers water at the rate of 9000 liters per second, sufficient both for the use of the city and for the irrigation of the surrounding country. Its total length is 97 miles,

of which 13 are underground. An extensive system of drainage works was completed in 1898, by which the sewage is carried miles to sea, leaving the waters of the harbor uncontaminated. The principal industries of Marseilles are the manufacture of soap, smelting of iron and copper, the construction of steam engines and automobiles, the refining of sugar, flour milling, oil factories, tanneries, lead, tin, and copper plants, petroleum refineries, and the manufacture of candles, macaroni, and tiles and brick. It also has iron-shipbuilding and naval-equipment yards. The great development of Marseilles is due chiefly to its commerce, which was greatly enhanced by the opening of the Suez Canal. The new harbor, begun in 1844, consists of a series of basins stretching northward from the entrance of the old harbor. An auxiliary harbor has been constructed in the channel between the two islets of Pomégue and Ratonneau lying off the promontory south of the city. Here are established the quarantine and the marine hospital. There are altogether 12 miles of quays, accommodating 2500 vessels at one time, and the new harbor has a water area of 414 acres, with a depth for vessels of all classes. The old harbor of 70 acres is now used for sailing vessels. In 1902 the Chamber of Commerce voted 91,400,000 francs for a canal to the mouth of the Rhone (see *CANALS, Boat Canals*), and a canal is also projected between the Rhone and the Loire, thus bringing Marseilles into connection with northern France. In 1912 the number of ships which entered and cleared was 4464, with a tonnage of 7,850,221, of which only about one-half was French. The value in 1904 of imports and exports combined was 2,061,000,000 francs; in 1912, 3,643,100,000. The principal exports are cotton and woolen goods, ribbons, silks, sugar, grain, oil, soap, fruits, wine, candles, and bricks; the chief imports are cattle, oil seeds, coffee, raw cotton and silk, hides, and grain. The trade is chiefly with the Mediterranean countries. The United States is represented by a consul.

The population of Marseilles in 1911 was 550,619. An idea of the growth of the city may be gained from the following figures: 1789, 100,000; 1851, 195,185; 1891, 403,749; 1901, 491,161; 1906, 517,498; 1911, 550,619. The increase has been due, at least in late years, wholly to immigration, as the death rate is higher than the birth rate. The districts around the wharves are frequented by people of all nationalities, and the busy, cosmopolitan air of the city is in marked contrast with the rest of Provence.

Marseilles is popularly supposed to have been founded by Greeks from Phocæa in Asia Minor, but archaeological discoveries have established the fact that a Phœnician colony preceded the Greek settlement of about 600 B.C. The Greek colony, called Massilia, soon supplanted the Phœnician, and became a flourishing commercial centre, a free city, and the mother city of a number of other Greek colonies, which spread as far west as Cape St. Martin in Spain. In the fourth century B.C. Pytheas (q.v.), a citizen of Marseilles, sailed even to Britain. Finds of coins have shown that Marseilles carried on trade, especially in wine, all through Gaul, and over the Alps to the Tirol. Since the chief trade rival of the city was Carthage, Marseilles allied itself with Rome during the Punic wars, at which time it was at the zenith of its power. Its schools were long preferred to those of Athens

for the education of Roman youths. During the civil wars it took the side of Marius and later that of Pompey. Caesar attacked and captured it in 49 B.C. and deprived it of its powers and privileges, and from that time its decadence began, though it still remained for a long time an intellectual centre. In the Middle Ages it retained to a large degree its independence. It was finally subject to the counts of Provence, and with Provence it was united with the French crown in 1481. In 1660 Louis XIV deprived the city of its privileges. Consult: Boudin, *Histoire de Marseille* (Paris, 1852); *Société de statistique de Marseille* (Marseille, 1837 et seq.); Teissier, *Histoire du commerce de Marseille, 1855-74* (ib., 1887); P. Castanier, *Histoire de la Provence dans l'antiquité*, vol. ii (Paris, 1896); E. Caman, *Marseille au XXème siècle* (ib., 1905).

MARSEILLES. A city in La Salle Co., Ill., 77 miles southwest of Chicago, on the Chicago, Rock Island, and Pacific and the Chicago, Ottawa, and Peoria railroads, on the Illinois River, and on the Illinois and Michigan Canal (Map: Illinois, G 3). It has excellent water power; its many manufactured products include paper boxes and cartons, roofing materials, paper box board, agricultural implements, concrete blocks, cigars, etc. There are also coal mines. A large railroad bridge spans the Illinois near here. Marseilles adopted the commission form of government in 1913. Pop., 1900, 2559; 1910, 3291.

MARSH, ANNE CALDWELL (c.1798-1874). An English author, born at Lindley Wood, Staffordshire. She wrote many novels, of which *Two Old Men's Tales* (1846), *Emilia Wyndham* (1846), and *Norman's Bridge* (1847) are considered the best. Most of her works were written anonymously, and it is not certain how many are rightly attributed to her. Her best work is of delicate conception, but lacks power. Several of the stories have been republished in the United States.

MARSH, GEORGE PERKINS (1801-82). An American diplomatist and philologist. He was born at Woodstock, Vt.; graduated at Dartmouth College in 1820; studied law in Burlington, and in 1835 was elected to the State Legislature and became a member of the Supreme Executive Council of the State. From 1843 to 1849 he was a Whig member of Congress, and in the latter year resigned to become Minister Resident at Constantinople. In 1852 he was charged with a special mission to Greece, and having traveled extensively in Europe returned to the United States in 1854. Between 1857 and 1859 he served as railroad commissioner for Vermont, and from 1861 until his death was first United States Minister to the Kingdom of Italy. He died at Vallombrosa, Italy, and was buried in the Protestant cemetery in Rome. His publications include: *The Camel: His Organization, Habits, and Uses, Considered with Reference to his Introduction into the United States* (1856); *Lectures on the English Language* (1861); *The Origin and History of the English Language* (1862; rev. ed., 1885); *Man and Nature* (1864; enlarged in 1874 as *The Earth as Modified by Human Action*; rev. ed., 1885). His second wife, Caroline (Crane) Marsh, published one volume of the *Life and Letters of George Perkins Marsh* (New York, 1888).

MARSH, HERBERT (1757-1839). Bishop of Peterborough. He was born in Faversham, Kent; graduated at St. John's College, Cambridge, in

1779, and studied theology at Leipzig. He was appointed Lady Margaret professor of divinity at Cambridge in 1807, Bishop of Llandaff in 1816, and Bishop of Peterborough in 1819. Opposing the allegorical systems of interpretation of the Fathers and the Middle Ages, he insisted that Scripture had but one sense, the grammatical, and was one of the first to introduce German methods of research into English biblical scholarship. His publications include: a translation of Michaelis' *Introduction to the New Testament* (5 vols., 1793-1801); *National Religion the Foundation of National Education* (1813); *Lectures on the Authenticity and Credibility of the New Testament* (1820-22); *On the Authority of the Old Testament* (1823); *Lectures on the Criticism and Interpretation of the Bible* (1828).

MARSH, OTHNIEL CHARLES (1831-99). An American zoölogist and paleontologist. He was born in Lockport, N. Y., graduated at Yale College, and studied in Germany. Upon his return to the United States he was appointed professor of paleontology and curator of the geological museum at Yale, and held these positions until his death. Professor Marsh accomplished a great amount of valuable scientific work in the discovery and description of new fossil vertebrates from the geological formations of the Western States and Territories. In carrying out his investigations he organized many exploring expeditions at his own expense, and directed others which were equipped by the United States Geological Survey. More than 400 new fossil species of vertebrates were described by Professor Marsh, among them such interesting types as the Dinocerata (huge tapir-like animals), Pterodaetyls (flying lizards), and Odontornithes (toothed birds). His discoveries of the fossil ancestors of the horse marked an epoch in evolutionary science and have been frequently employed as an illustration of the principle of evolution. The more extended and general articles by Professor Marsh were incorporated in the *Reports* and *Monographs* of the United States Geological Survey; they included: "Birds with Teeth," *Third Annual Report*, 1883; "The Gigantic Mammals of the Order Dinocerata," *Fifth Annual Report*, 1885; "The Dinosaurs of North America," *Sixteenth Annual Report*, 1896; "Dinocerata," *Monograph X*; "The Ceratopsia," *Monograph XLIX* (elaborated by J. B. Hatcher and edited by R. S. Lull). Consult G. B. Grinnell, "Othniel Charles Marsh," in *Leading American Men of Science*, edited by D. S. Jordan (New York, 1910). He served as president of the American Association for the Advancement of Science in 1878 and of the National Academy of Sciences from 1883 to 1895. The Geological Society of London, of which he was a fellow, bestowed upon him the first Bigsby medal, in 1877. He also received the Cuvier prize of the French Academy of Sciences. His valuable collection of fossil vertebrates was left to Yale University.

MARSH, SYLVESTER (1803-84). An American merchant, inventor, and promoter, born at Campton, N. H. In 1833 he removed to Chicago, where he became the originator of the meat-packing industry and invented many of the appliances now used in that business. In 1837, after most of his property was lost in the financial crisis, he entered the grain business and invented the dried-meal process. During a visit to his old home in 1852 he conceived the idea of a rail-

road to the top of Mount Washington, insisted upon the feasibility of the plan, and persisted until in 1858 he obtained a charter for the construction of the road, but because of the Civil War was unable to begin work until 1866. The work was completed in 1868. The cogs and brakes used on the road were invented by Marsh. Railways of a similar kind and construction were soon afterward built up Mount Rigi, Switzerland, and up Green Mountain, Mount Desert, Maine, and many others have followed.

MAR'SHAL (OF. *mareschal*, *marcschal*, Fr. *maréchal*, from ML. *mareschalcus*, *mariscalcus*, from OHG. *marahscalh*, groom, master of the horse, marshal, from *marah*, AS. *nearh*, Ir., Gael. *marc*, Gk. *μάρκας*, *markas*, horse + *scalh*, Ger. *Schalk*, Goth. *skalks*, AS. *sealc*, obsolete Eng. *shalk*, servant). A term in English history, originally meaning a groom or manager of the horse, though eventually the King's marshal became one of the great officers of the household of the Norman and Plantagenet kings, being conjointly with the constable (q.v.) a judge in the *curia martiales*, or courts of chivalry, and enjoying equal rank with the Chancellor. The constable's functions were virtually abolished in the time of Henry VIII, and the marshal became thenceforth the sole judge in questions of honor and arms. The earl marshal is president of the English College of Heralds, and appoints the kings-at-arms, heralds, and pursuivants. The dignity of marshal existed formerly in Scotland, where a different orthography was adopted, and the office of *marischal* became hereditary in the fourteenth century in the family of Keith. In France the highest military officer is called a marshal, a dignity which originated early in the thirteenth century. There was at first only one *maréchal de France*, and there were but two till the time of Francis I. Their number afterward became unlimited. Originally the marshal was the esquire of the King and commanded the vanguard in war; in later times the command became supreme and the rank of the highest military importance. From the title of this class of general officers the Germans have borrowed their *Feldmarschall*, and the English the title of field marshal, a dignity bestowed on commanders distinguished either by elevated rank or superior talents. The title "marshal" in the United States is used: (1) to denote the ministerial officer of the United States courts, there being, with several exceptions, one appointed for each judicial district. The exceptions are the few instances where one marshal is required to perform the duties of two districts. The duties of this officer resemble those of a sheriff in the State courts; he opens and closes the sessions of the district and circuit courts, serves warrants, and executes throughout the district all lawful precepts directed to him. Marshals are also appointed for Porto Rico, Alaska, and Hawaii. (2) In many States of the South and West the marshal is the town or village police officer, and is to be distinguished from the officers of the county called sheriffs, and from the officers of the justices' courts called constables. Besides their functions in connection with the courts, the United States marshals discharge duties in connection with the administration of the internal-revenue service, public lands, the mail service, etc. They are appointed by the President with the advice and consent of the Senate for a term of four years.

MAR'SHALING. In law, the arrangement

or ordering and distribution of different funds under administration so that all parties having rights as creditors or legatees therein may receive their due proportions. The principle upon which this is done is the equitable rule that a party who is entitled to satisfaction or security out of one or more of several funds or properties which must be looked to by others for their satisfaction or security shall not be allowed to elect to satisfy or secure himself so as to exclude another who is entitled to resort to only one of the funds, when the first party can otherwise sufficiently protect himself. The principle of marshaling is applied to the distribution of assets of a decedent or insolvent among legatees and creditors, as well as to the distribution of securities of various sorts among creditors who may be variously entitled to them. An instance of marshaling of assets is found in the old rule that a simple contract creditor, who was at the common law entitled to payment only out of the personal estate of a deceased person, was subrogated to the right of a specialty creditor to be paid out of real or personal assets where the latter had recovered out of the personal assets. So to-day legatees, who are, of course, entitled only to personal estate, may have their claims satisfied out of the real estate where simple contract creditors, who might now resort to the real estate, have satisfied their claims out of the personal estate and in so doing have exhausted it.

The doctrine of marshaling securities is most frequently exemplified in the case of mortgages and others having rights, such as vendor's liens, judgment liens, etc., against the real estate of the debtor. Thus, where the owner of two estates or funds mortgages both to one person and only one of them to another person, the first encumbrancer will be required to resort in the first instance to the estate or fund on which the other has no claim. The same principle has been applied to mortgages of personal chattels, to sureties who have become liable to pay the principal debt, and in many other cases. The doctrine is an admirable example of the way in which the courts of equity work out the principle, "Equality is equity." See EQUITY; SUBROGATION.

MARSHALING OF ARMS. In heraldry, the science of arranging several coats of arms on the same escutcheon so as to indicate the relation borne by one person to others connected with him either by birth or marriage. See HERALDRY.

MAR'SHALL. A city and the county seat of Clark Co., Ill., 18 miles west by south of Terre Haute, Ind., on the Vandalia and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Illinois, J 7). It has some trade and manufactures of flour, lumber, furniture, condensed milk, etc., and is in an oil and an agricultural and stock-raising district. The water works and electric-light plant are owned by the city. Pop., 1900, 2077; 1910, 2569.

MARSHALL. A city and the county seat of Calhoun Co., Mich., 108 miles by rail west of Detroit, on the Kalamazoo River and on the Michigan Central Railroad (Map: Michigan, F 6). It has the grounds of the County Agricultural Society, the Dulcinea Home for Old Ladies, and a fine high-school building, city library, and county courthouse. The city is the centre of a rich farming district, and manufactures coffee-roasting and peanut-butter machinery, hot-air

furnaces, couplers and axles, carriages and wagons, bathtubs, electrical appliances, farming implements, medicines, flour, etc. There are also marble and granite works, and roundhouses of the Michigan Central Railroad. Marshall owns and operates the water works and electric-light plants, both of which are run by water power, on a profitable basis. Pop., 1900, 4370; 1910, 4236.

MARSHALL. A city and the county seat of Lyon Co., Minn., 165 miles west by south of St. Paul, on the Redwood River and on the Great Northern and the Chicago and Northwestern railroads (Map: Minnesota, B 6). It has a public library, and among the prominent buildings are the public schools, county courthouse, and county jail. An important trade is carried on, and there are several grain elevators, a sash and door factory, a flour mill, and a creamery. The water works and electric-light plant are owned by the city. Pop., 1900, 2088; 1910, 2512.

MARSHALL. A city and the county seat of Saline Co., Mo., 84 miles by rail east of Kansas City, on the Chicago and Alton and the Missouri Pacific railroads (Map: Missouri, C 2). It is the seat of Missouri Valley College (Presbyterian), founded in 1889, and Academy Notre Dame de Sion (Catholic), and has a handsome courthouse, United States government building, and a State institution for the feeble-minded and epileptics. Marshall is near deposits of coal, salt, and building stone, and carries on an important trade, and manufactures flour, shoes, creamery products, lumber, brick and tile, carriages and wagons, and canned goods. The water works are owned by the city. Pop., 1900, 5086; 1910, 4869.

MARSHALL. A city and the county seat of Harrison Co., Texas, 42 miles west of Shreveport, La.; on the Texas and Pacific and the Marshall and East Texas railroads (Map: Texas, E 3). It is the seat of Wiley University (Methodist Episcopal) and Bishop College (Baptist) for negroes, and has a fine courthouse, city hall, high school, Carnegie library, and opera house. The city is in a fertile agricultural region adapted particularly for fruit and vegetable cultivation, and the vicinity possesses valuable oak and pine forests. Among the industrial enterprises are a foundry and machine shops, cotton compress, saw and planing mills, brick-yards, fertilizer factory, pottery plant, carriage works, railroad shops of the Texas and Pacific and Marshall and East Texas railroads, car-wheel works, etc. The water works are owned and operated by the municipality. Marshall has adopted the commission form of government. Pop., 1900, 7855; 1910, 11,452; 1914 (U. S. est.), 12,984; 1920, 14,271.

MARSHALL, ALFRED (1842-). An English economist, born in London. From the Merchant Taylors' School he passed to St. John's College, Cambridge, where he graduated with distinction in 1865. In 1877 he became principal of University College, Bristol, and in 1883-84 was lecturer and fellow of Balliol College, Oxford. From 1885 to 1908 he served as professor of political economy at Cambridge. In 1891 he was appointed a member of the Royal Commission of Labor. With his wife he published (1879) *Economics of Industry*. His *Principles of Economics* (1890) won for him the position of one of the foremost of English economists. In this work he seeks to present and reconcile

the essential doctrines of classical and modern economics. He published also: *Present Position of Economics* (1886); *Elements of Economics* (1891); and numerous articles in scientific and popular periodicals.

MARSHALL, ARTHUR MILNES (1852-93). An English naturalist, born at Birmingham. He received his B.A. degree from London University at the age of 18 and then went to Cambridge, where he graduated in 1874. In the following year he was sent by that university to the zoological station at Naples. Upon his return he began the study of medicine, but in 1879 became professor of zoology at Owens College, Manchester. He was made a fellow of the Royal Society in 1885, a councilor of the same in 1891-92, and presided over a section of the British Association in 1892, but was particularly distinguished as a teacher and organizer. He started the biological classes at Victoria University, and contributed much to the scientific knowledge of embryology in his technical publications, especially the *Quarterly Journal of Microscopical Science*, and in separate memoirs. Among his writings are: *The Segmental Value of the Cranial Nerves* (1882); *The Frog* (1882; 10th ed., 1909); *A Junior Course of Practical Zoology* (1887; 5th ed., 1899), with C. H. Hurst; *Vertebrate Embryology* (1893). He lost his life in the Alps. His *Biological Essays and Addresses* were collected and published posthumously in 1894, as well as his memoir upon *The Darwinian Theory*.

MARSHALL, EMMA (1832-99). An English novelist, born near Cromer in Norfolk, England, the youngest daughter of Simon Martin, a Norwich banker. She was educated in a private school at Norwich. In 1854 she married Hugh Graham Marshall, and thereafter lived an uneventful life at Wells, Exeter, Gloucester, and Bristol. She died at Clifton, May 4, 1899. Beginning with *Edith Prescott* (1863), she produced during her long career more than 100 volumes of tales, mostly for the young. Especially popular—several of them were translated into German—were those in which appeared well-known historical characters, as Sir Philip Sidney and Sir Thomas Browne. Among her latest novels were: *In Colston's Days, a Story of Old Bristol* (1883); *The Tower on the Cliff* (1886); *Penshurst Castle, in the Time of Sir Philip Sidney* (1893); *In the Choir of Westminster Abbey in the Time of Henry Purcell* (1897); *Under the Dome of St. Paul's in the Time of Christopher Wren* (1898). She also wrote verse.

MARSHALL, FRANCIS ALBERT (1840-89). An English playwright, born in London, November, 1840. He was educated at Harrow and studied at Exeter College, Oxford, but left without a degree. He became a clerk in the audit office of Somerset House and began writing for newspapers and periodicals. In 1868 he resigned his post and subsequently joined the staff of the London *Figaro* as dramatic critic. He was already known for his comedies and farces: *Mad as a Hatter* (1863); *Corrupt Practices* (1870), which were followed by *Q. E. D.*, or *All a Mistake* (1871); *False Shame* (1872); *Brighton* (1874); *Lola* (1881), a comic opera; and several others. For Henry Irving he made a version of *Werner* (1887). He was general editor of the Henry Irving Edition of Shakespeare (1888-90), and had earlier published *A Study of Hamlet* (1875) and *Henry Irving, Actor and Manager* (1883).

MARSHALL, HENRY RUTGERS (1852-).

An American architect and psychologist. He was born in New York City; graduated from Columbia University in 1873 (A.M., 1876); and became a practicing architect in New York in 1878. He lectured on aesthetics at Columbia in 1894-95 and at Princeton in 1915-16. Though Marshall achieved success as an architect and was president of the New York chapter of the American Institute of Architects (1902-04), he became better known perhaps as a psychologist. Rutgers and Hobart colleges gave him honorary degrees. He served as president of the American Psychological Association in 1907. His writings include: *Pain, Pleasure, and Aesthetics* (1894); *Aesthetic Principles* (1895); *Instinct and Reason* (1898); *Consciousness* (1909); *War and the Ideal of Peace* (1915).

MARSHALL, HUMPHREY (1722-1801). An American botanist, born in West Bradford (Marshallton), Pa. He learned the trade of a stonemason, but about 1748 turned to farming, and began to cultivate his scientific tastes, which he had ample means of gratifying through the acquisition of property in 1767, and six years afterward he was instrumental in the formation of the botanic gardens at Marshallton. He held several local offices, was made a member of the American Philosophical Society (1786), and published *Arboretum Americanum* (1785), a catalogue of the trees and shrubs of America, which was translated into French.

MARSHALL, HUMPHREY (1756-1841). An American statesman, cousin of Chief Justice John Marshall, born in Westmoreland Co., Va. He received very little schooling, entered the Continental army during the Revolution, and attained the rank of captain. Before the close of the war he removed to Kentucky and settled in 1780 near Lexington, where he studied law and was admitted to the bar. In 1787 he was a delegate to the convention held at Danville to consider the question of separating Kentucky from Virginia, and strongly opposed that project. He soon became known as one of the strongest Federalist leaders in the Kentucky region. In 1788 he was a delegate to the Virginia convention that ratified the Constitution. He had an inborn dislike for James Wilkinson (q.v.), whom he seems to have suspected of intriguing with the Spaniards in Louisiana from the first, and for a decade or more occupied the position of a sort of "watch-dog" of Federal interests in Kentucky and was active in opposing and exposing the numerous Spanish intrigues and plans for attacking the Spanish or French at New Orleans. He opposed the plan of George Rogers Clark for an expedition against the Spaniards in 1793, declaring it was a part of the scheme of Genet (q.v.), and would only have the effect of embroiling the country with a friendly power. From 1795 to 1801 he was a United States Senator from Kentucky. His letters to the *Western World* signed Observer, in which he clearly pointed out the existence of the Burr conspiracy, led to Federal action and the thwarting of Burr's plans of empire. While a member of the State Legislature in 1809 he fought a duel with Henry Clay in which both were wounded. He published a *History of Kentucky* (1812; 2 vols., 1824), which is in reality a curious and partisan piece of autobiography, but contains much of value in regard to early politics in the West.

MARSHALL, HUMPHREY (1812-72). An American soldier and politician, grandson of Humphrey Marshall (1756-1841), born at

Frankfort, Ky. He graduated at West Point in 1832, but resigned from the army the next year. He studied law and practiced in Frankfort and in Louisville, where he took much interest in the State militia, raising a company of volunteers for service against the Indians on the Texas frontier. At the outbreak of the Mexican War he entered as colonel of a Kentucky volunteer cavalry regiment and led the charge at Buena Vista. He was a Whig member of the United States House of Representatives in 1849 and was reelected in 1851, but resigned in 1852 and accepted the post of Commissioner to China. He retired in 1854, and the next year again entered the House of Representatives, on the American ticket (see AMERICAN PARTY; KNOW-NOTHINGS), and served until 1859. At the beginning of the Civil War he entered the Confederate army as brigadier general and commanded in eastern Kentucky. He was in command of the Confederates at the battle of Middle Creek (1862) and in the same year defeated Gen. Jacob Cox at Princeton, Va. He resigned from the army to practice law in Richmond, but was elected one of Kentucky's representatives in the Confederate Congress, serving on the military committee, and was afterward reelected. After the war he resumed the practice of law in Louisville.

MARSHALL, JOHN (1755-1835). The most famous of American jurists, for 34 years Chief Justice of the United States Supreme Court. He was born Sept. 24, 1755, in Fauquier Co., Va.; studied under a private tutor; then attended an academy in Westmoreland County; and studied law until the outbreak of the Revolution, when he entered the army as a volunteer. He soon rose to the rank of first lieutenant, and by 1777 was a captain. His first fight was near Norfolk; he afterward served in the New Jersey campaign, was at Valley Forge during the memorable winter of 1777-78, and participated in the battles of Brandywine, Germantown, and Monmouth, and in the capture of Stony Point. During most of 1780, while without a command, he attended the law lectures delivered by the famous Chancellor George Wythe at William and Mary College. The following year he was admitted to the bar of Fauquier County, where he practiced for two years. In 1782 he was elected to a seat in the Virginia Legislature and soon became a member of the Executive Council. In the meantime he had removed to Richmond. In 1784 he was again elected to represent Fauquier County in the Legislature. In 1787 he was chosen to represent Henrico, the county in which he had lately taken up his residence, and in the following year was a delegate to the State convention which was called to ratify the Federal Constitution. The distinction of securing the adoption of the Constitution by Virginia belongs to Marshall and Madison perhaps more than to any others. Marshall's refutations of Patrick Henry's arguments against adoption were particularly effective. In the meantime his law practice was rapidly increasing, and he declined a reelection to the Legislature in 1792 in order to devote his whole time to his practice, but in 1795 he was again persuaded to stand for reelection and was successful. It was about this time that Marshall appeared before the Supreme Court in the famous case of *Ware v. Hilton*, in which the validity of the Virginia Sequestration Act was involved, and his able argument added greatly to

his growing reputation. He declined to accept the post of Attorney-General or the French mission tendered him by President Washington, but finally consented to go to Paris in 1797 with C. C. Pinckney and Elbridge Gerry to induce the Directory to remove the restrictions which it had laid on American commerce. Although the negotiations proved fruitless, Marshall's conduct seems to have been more satisfactory to the government than that of either of his colleagues. In 1798 he declined to accept a seat on the bench of the United States Supreme Court as the successor of James Wilson, but in the same year at the solicitation of Washington became a candidate for Congress and was elected, although his constituency was decidedly Anti-Federalist in politics. In Congress he supported the administration in particular and Federalist measures generally, although he voted for the repeal of the obnoxious Alien and Sedition Acts. His most notable effort in Congress was a speech in support of the conduct of the President in surrendering Jonathan Robbins, the murderer of a man on a British frigate, who had escaped to the United States and had been delivered up to the British government by the President. Marshall showed conclusively that the surrender of Robbins was clearly within the President's constitutional power. In May, 1800, he was invited by President Adams to take the office of Secretary of War, but declined. However, he accepted the position of Secretary of State, which he held for a short time. On Jan. 31, 1801, he was commissioned Chief Justice of the United States Supreme Court. The accession of Marshall to the bench of the Supreme Court as Chief Justice marks a turning point in his life and an epoch in the legal and constitutional history of the United States. He died July 6, 1835, at Philadelphia, whither he had gone for medical treatment. For 34 years Marshall dominated the court by his great learning, his masterful power of analysis and clearness of statement. Perhaps no judge ever excelled him in the capacity to hold a legal proposition before the eyes of others in such various forms and colors. He resolved every argument by the most subtle analysis into its ultimate principles, and then applied them to the decision of the case in question. His service on the bench, which continued until his death, was effective and conspicuous not only in securing for the court the recognition and profound respect for which hitherto there had been no especial occasion, but also in so expounding the Constitution as to make clear for the first time the nature of the national government and to forecast the lines along which, in actual development as well as in judicial interpretation, the nation was to proceed. In the period of Marshall's predominance the court upheld the Federalist theories, as in the national bank case of *McCulloch v. Maryland*, and gave a clear definition of the relations of the State and national governments. On the subject of the constitutional prohibition against the impairment of contracts, several noteworthy opinions were rendered by him, culminating in the famous Dartmouth College case, the soundness of which has more recently been questioned. Particularly in the field of constitutional law the work of Marshall forms the greatest contribution to American jurisprudence made by any judge. In a single decision, the famous case of *Marbury v. Madison* (1 Cranch, 137), he established the authority of the Federal courts to set

aside an act of Congress on the ground of its unconstitutionality, and thus he placed on a firm footing the principle of judicial supremacy. His interpretations of the Constitution have long been recognized as an important and permanent feature of American public law. In the field of international law, also, his contribution was very great, as witness especially his opinion in *Schooner Exchange v. McFaddon* (7 Cranch, 116). This aspect of Marshall's importance had not been widely appreciated until it was discussed by John Bassett Moore in *John Marshall* (Boston, 1901). Mr. Moore says that from 1790 to 1801 only six decisions involving Constitutional questions had been rendered by the Supreme Court; from 1801 to 1835 there were 62, of which 36 were written by Marshall. During his period of service there were 195 cases involving points of international law, and Marshall delivered the opinion in 80 of these. Aside from his judicial labors, Marshall wrote a *Life of George Washington* (5 vols., 1804-07; 2d ed., 2 vols., 1832). His introduction to this work, *A History of the Colonies Planted by the English on the Coast of North America*, was published separately in 1824. *John Marshall, Complete Constitutional Decisions*, edited by J. M. Dillon, appeared in 1903 (Chicago), and *The Constitutional Decisions of John Marshall*, edited with introductory essay by J. O. Cotton, Jr., in 1905 (2 vols., New York). Consult also: A. B. Magruder, *John Marshall* (Boston, 1885; new ed., 1908); Henry Hitchcock, in T. M. Cooley et al., *Constitutional History of the United States as Seen in the Development of American Law* (New York, 1887); J. F. Dillon, *John Marshall* (3 vols., Chicago, 1903); H. Flanders, *Life of John Marshall* (Philadelphia, 1905); J. E. Oster, *The Political and Economic Doctrines of John Marshall; also his Speeches, Letters, and hitherto Unpublished and Uncollected Writings* (New York, 1914).

MARSHALL, JOHN (1818-91). An English anatomist and surgeon. He was born at Ely, Cambridgeshire, and was educated at University College, London, where he became a demonstrator in surgery in 1845, assistant surgeon at the hospital in 1847, surgeon and professor of surgery in 1866, and consulting surgeon in 1884. He became also professor of anatomy at the Royal Academy in 1873, and was president of the Royal College of Surgeons in 1883. In surgery he introduced the galvanocautery and the operation for the excision of varicose veins. He showed great ability as a teacher of anatomy to art students. His publications include: *A Description of the Human Body, its Structure and Functions* (1860; 4th ed., 1883); *Anatomy for Artists* (1878; 3d ed., 1890); *The Outlines of Physiology, Human and Comparative* (3 vols., 1867).

MARSHALL, LOUIS (1856-). An American lawyer, born at Syracuse, N. Y. He studied at Columbia Law School; began practice at Syracuse in 1878; and later became a member of the firm of Guggenheimer, Untermeyer, and Marshall, of New York City. He lectured at New York Law School in 1900 and at the Law School of Syracuse University in 1901; was appointed chairman of the New York Immigration Commission by Governor Hughes in 1908; served as mediator in settling the cloak makers' strike in 1910; and was counsel for Governor Sulzer in his impeachment trial in 1913 and for Leo M.

Frank in Georgia in 1914-15. Marshall was a leader in the movement which brought about the abrogation in 1911 of the Treaty of 1832 with Russia; under the treaty the Russian government had found it possible to discriminate against Russian Jews who had become naturalized citizens of the United States. Marshall identified himself actively with Jewish educational and institutional work. In 1913 he received the honorary degree of LL.D. from Syracuse University, of which he became trustee in 1910 and to which he presented a law library.

MARSHALL, ORSAMUS HOLMES (1813-84). An American lawyer and historical writer. He was born at Franklin, Conn., graduated at Union College in 1831, studied law, spending some time at Yale, and entered upon active practice, having been admitted to the bar at Buffalo in 1834. His interest in literary and historical subjects was early manifested. He was one of the founders of the Buffalo Female Academy and of the Buffalo Historical Society, and for many years was chancellor of the University of Buffalo. His historical writings concern chiefly the relations of the Iroquois with French and English and are of considerable value. A volume was collected after his death entitled *Historical Writings of Orsamus H. Marshall Relating to the Early History of the West* (1887).

MARSHALL, ROBERT (1863-1910). A Scottish playwright. He was born in Edinburgh and was educated at St. Andrews and Edinburgh universities. In 1886 he was commissioned a lieutenant in the West Riding Regiment; served as district adjutant in Cape Town in 1893-94; was promoted to captain in 1895; and was aide-camp to the Governor of Natal from 1895 to 1898, when he retired from the army. His plays include: *The Shades of Night* (1896); *His Excellency the Governor* (1898); *The Broad Road* (1898); *A Royal Family* (1899); *The Noble Lord* (1900); *The Second in Command* (1900); *There's Many a Slip* (1902); *The Haunted Major* (1902); *The Unforeseen* (1902); *The Duke of Killycrankie* (1904); *Everybody's Secret* (1904); *The Lady of Leeds* (1905); *The Alabaster Staircase* (1906).

MARSHALL, STEPHEN (c.1594-1655). A Presbyterian leader. He was born at Godmanchester, Huntingdonshire, England, graduated B.A. at Cambridge (1618), entered the ministry and joined the ranks of the Nonconformists. He was an eloquent man, considered in some quarters the greatest preacher of the day; not learned or original, but influential because of his personality and eloquence. Beginning with the advocacy of a reform of the Church of England, while retaining episcopacy and liturgy, he ended with the *de jure divino* Presbyterian theory. He was one of the leaders of the Westminster Assembly (1643 et seq.). Marshall published many sermons. One treatise, *A Defense of Infant Baptism* (1646), may be mentioned. He was also one of the joint authors of a pamphlet published at London (1641), called *An Answer to a Booke* [by J. Hall, Bishop of Norwich] entitled *An Humble Remonstrance. In which the originall of Liturgy* [and] *Episcopacy is Discussed. And Quæres Propounded Concerning Both*. Written by Smectymnus.

MARSHALL, THOMAS RILEY (1854-). An American lawyer and public official, descended from the famous John Marshall family of Virginia. He was born at North Manchester, Ind., was educated at Wabash College (A.B., 1873;

A.M., 1876), and studied law in the office of Judge Olds of Fort Wayne, being admitted to the bar in 1875. He practiced law at Columbia City, where as a member of the firm of Marshall and McNagly and later, in 1892, of Marshall, McNagly, and Clugston, he attained success. His practice extended beyond his county, and he became known as an orator. In 1880 he was a candidate for district attorney, but was defeated; from 1896 to 1898 he was chairman of the Democratic committee of his congressional district; and in 1908 he was nominated for Governor and was elected. Although a conservative in his belief in the maintenance of traditional political institutions, he had a progressive administration, advocating the direct election of Senators, an employers' liability law, and anti-race-track and bookmaking legislation. His efficiency in office and his alleged opposition to the Taggart faction—an opposition which, however, did not reach an open rupture—brought him favorable national attention. In 1912 he was the "favorite son" candidate of Indiana for the presidential nomination, and, while unsuccessful in this ambition, he was given that for Vice President. He proclaimed himself a "progressive with the brakes set." After his election he consistently supported the Wilson administration. In 1913 certain of his speeches regarding the social unrest growing out of discontent with the present distribution of wealth, in which he was reported as advocating revolutionary ideas respecting inheritance of property, occasioned surprise and criticism, partly through misunderstanding. He received honorary degrees from Wabash College, Notre Dame University, and the University of Pennsylvania. See INDIANA, *History*.

MARSHALL, WILLIAM CALDER (1813-94). A Scottish sculptor. He was born in Edinburgh, March 18, 1813. He studied sculpture at the Trustees' Academy, Edinburgh, and in London, under Chantry and Bailey. In the schools of the Royal Academy he won a gold medal and traveling scholarship, and from 1836 to 1838 continued his studies in Rome. His work was chiefly idealistic statuary, and among his productions of this class are: "The Creation of Adam" (1842); "Christ Blessing Little Children" (1844); "Paul and Virginia" (1845); "Sabrina" (1846), perhaps the most popular of all his figures; and the group "Agriculture" on the Albert Memorial. In historical figures he modeled the bronze statue of Sir Robert Peel in Manchester, and in Westminster Palace the busts of Chaucer, Lord Clarendon, and Lord Somers. In decoration he was extensively engaged in the ornamentation of the new Houses of Parliament and the Wellington Chapel in St. Paul's Cathedral. His work is in the pseudoclassic style of his day, but is marked by simplicity and refinement and elegance of design. He died in London, June 16, 1894.

MARSHALL, WILLIAM LOUIS (1846-1920). An American soldier and engineer, born at Washington, Ky. He attended Kenyon College, Ohio, in 1859-61; served as a private in the Tenth Kentucky Cavalry in 1862-63; and graduated from the United States Military Academy in 1868. Entering the engineering branch of the service, he was promoted through the various grades to brigadier general and chief of engineers in 1908. He was acting professor of natural and experimental philosophy at West Point in 1870-71. While in charge of the Colo-

rado section of the "Explorations West of the 100th Meridian" in 1872-76 he discovered (1873) Marshall Pass across the Rocky Mountains and the gold placers of Marshall Basin on the San Miguel River, Colo., in 1875. He had charge of levee construction and improvements on the Mississippi River in 1881-84, and thereafter until 1900 of harbor improvements on Lake Michigan and river improvements in Illinois and Wisconsin. He superintended also the construction of the Hennepin Canal (1890-1900), of the Ambrose channel entrance to New York harbor, and of fortifications for that harbor. As chief engineer he had charge of all the river and harbor and fortification works of the United States from 1903 to 1910, when he was retired.

MARSHALL ISLANDS. An archipelago in Micronesia, situated east of the Caroline Islands and belonging to Germany since 1885 (Map: Australasia, J 2). It consists of two parallel chains of atolls, the Ratak chain of 13 islands in the east and the Ralik of 11 islands in the west, with an aggregate area of 158 square miles. The islands are low, the water supply scanty, and the soil very poor, supporting a scanty flora, in which the coconut and the breadfruit tree predominate. The chief export is phosphate, which in 1910 appeared in the statistical returns with a valuation of 8,561,000 marks. The population of the whole archipelago in 1910 was about 15,000, of whom 179 were Europeans, 91 being Germans. The islands are administered by an Imperial Commissioner residing on the island of Jaluit. These islands were occupied by the Japanese during the war which broke out in Europe in 1914. See WAR IN EUROPE.

MARSHALLTOWN. A city and the county seat of Marshall Co., Iowa, 60 miles by rail northeast of Des Moines, on the Iowa River and on the Chicago Great Western, the Minneapolis and St. Louis, and the Chicago and Northwestern railroads (Map: Iowa, E 2). It is the seat of the Iowa State Soldiers Home and has a public library. It is a shipping point for large quantities of grain, and among its industrial establishments are extensive meat-packing plants, manufactories of steel furnaces and steam specialties, flour mills, grain elevators, canning and bottling works, and carriage factories. The surrounding region is adapted to agriculture and stock raising. Settled in 1860, Marshalltown was incorporated as a town in 1865 and received a charter as a city of the second class in 1868. The commission form of government was adopted in 1912. The city owns and operates the water works and electric-light plant. Pop., 1890, 8914; 1900, 11,544; 1910, 13,374; 1914, (U. S. est.), 14,042; 1920, 15,731.

MARSHAL'S COURT. See CHIVALRY, COURT OF.

MARSHALSEA. A former prison in Southwark, London, connected with a court of the same name. It was abolished in 1849.

MARSHBANKER. See MARSEBANKER.

MARSH-CALDWELL, MRS. ANNE (1791-1874). An English novelist, daughter of James Caldwell, of Linley Wood, Staffordshire. In 1817 she married Arthur Cuthbert Marsh, of Eastbury Lodge, Hertfordshire. Encouraged by Harriet Martineau, she published *Two Old Men's Tales* (1834). In the course of a few years she took rank among the popular novelists of her time. She published anonymously, and a complete list of her novels has never been made. Fifteen volumes appeared in the *Parlour Library*

(1857). They depict mostly the manners of the upper middle class and the lower aristocracy. *Emilia Wyndham* (1846) seems to be one of the best.

MARSH CROCODILE. See MUGGER.

MARSHES. See WASTE LAND.

MARSHFIELD. A town in Coos Co., Ore., 10 miles north of Coquille; situated on Coos Bay, on the Coos Bay, Roseburg, and Eastern Railroad, and on the lines of the Inter-Ocean Transportation Company, the Northern Pacific Steamship Company, and the Southern Pacific Steamship Company (Map: Oregon, A 4). Marshfield has a navigable channel 300 feet wide and 25 feet deep. Features of interest in the town and the vicinity are the Carnegie library, Golden and Silver Falls, and the Ten Mile Lakes. The chief industries are lumbering, coal mining, fishing, dairying, and market gardening; and there are also manufactories of myrtle-wood novelties, pulp, paper, veneered woods, boxes, boats, and doors and sashes. Pop., 1900, 1391; 1910, 2980.

MARSHFIELD. A city in Wood Co., Wis., 175 miles northwest of Milwaukee, on the Chicago and Northwestern and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Wisconsin, C 4). Among the noteworthy features are the public library, hospital, city hall, county asylum buildings, experiment farm, and three parks. Marshfield has extensive manufactures of lumber, including staves, headings, barrels, and furniture, also beds, springs, mattresses, veneer, foundry products, metal goods, gasoline engines, creamery products, etc. Dairying has assumed a position of great importance in recent years. There is also some trade in grain and live stock. The city owns its electric-light and power plant. Pop., 1900, 5240; 1910, 5783. Marshfield was almost entirely destroyed by fire in 1888, but has been rebuilt completely.

MARSH GAS. See METHANE.

MARSH HARE, or RABBIT. A hare (*Lepus*, or *Sylvilagus*, *palustris*) of the lowlands along the southern Atlantic seaboard, which is slightly larger than the cottontail, measuring 18 inches, and differs in its nearly bare feet and more scanty pelage. It frequents boggy lands, and readily takes to the water.

MARSH HAWK, or HEN HARRIER. A bird of prey (*Circus cyaneus* of Europe, or *Circus hudsonius* of North America) which haunts marshy places. The adult male is light bluish gray, the tail is barred with six to eight bands, and the tips of the wings are blackish. The female is dusky or rusty brown, streaked about the head. Both sexes may be easily recognized by the broad white patch on the rump. Though long-winged and capable of strong flight, it is habitually slow in its movements, sweeping back and forth over low meadows, river margins, and wet ground generally, in search of the small game to be found in such places, keeping near the ground and dropping suddenly upon its prey—more often a frog or a mouse than anything else. Only rarely does it seize a bird or disturb poultry; and its services are of great value to the agriculturists and should be encouraged. It was classed as "ignoble" in falconry. These hawks nest upon the ground in some marsh, and lay four or five nearly globular, dirty-white eggs. Consult: Elliott Coues, *Birds of the Northwest* (Washington, 1874); Fisher, *Hawks and Owls of the United States* (ib., 1893); Chandler, "Modifications and Adaptations to

Function in the Feathers of *Circus hudsonius*" in *University of California Publications in Zoölogy* (Berkeley, 1914); and standard authorities. See Plate of EAGLES AND HAWKS.

MARSH HEN, or MUD HEN. A gunner's name for various rails, coots, and gallinules (qq.v.).

MARSH MALLOW. A name applied to *Althæa officinalis*, native of Great Britain and naturalized in the United States, in both of

MARSH MALLOW (*Althæa officinalis*).

which countries it grows in meadows and marshes, particularly near the seacoast. The whole plant, which is a woody herb, abounds in mucilage, especially in the perennial root, confections made from it being known as *pâtes de guimauve*. The leaves and tender twigs have been used for food in some regions during seasons of scarcity. The hollyhock (*Althæa rosea*) is an allied species. See HOLLYHOCK; ALTHÆA.

MARSHMAN, JOSHUA (1768-1837). An English missionary. He was born at Westbury Leigh, Wiltshire, and was sent in 1799 by the Baptist Missionary Society to India to join William Carey (q.v.) and his colleagues. They established their mission at Serampur, a Danish colony, 16 miles above Calcutta, and to supplement the scanty funds sent out by the society schools were opened for both European and native children. This course did not meet the approval of the society, and in 1826 Marshman returned to England to try to effect a settlement of the differences. He failed in his object, and the matter ended in a separation of the Serampur mission for the society. He returned to Serampur in 1829 and died there, Dec. 5, 1837. In addition to his special missionary duties Dr. Marshman gave himself with great zeal to the study of the Bengali, Sanskrit, and Chinese languages, and became an extraordinary linguist. He published: *A Dissertation on the Characters and Sounds of the Chinese Language* (1809); *The Works of Confucius, Containing the Original Text with a Translation* (1809); *Clavis Sinica* (1814); *Elements of Chinese Grammar, with a Preliminary Dissertation on the Characters and Colloquial Medium of the Chinese* (1814). He also prepared the first complete Chinese version of the Bible. He assisted Dr. Carey in preparing a Sanskrit grammar and a Bengali and English dictionary and the Bible in Telugu. Consult J. C. Marshman, *Life and Times of the Serampur Missionaries*

(London, 1859), and Carey, *Marshman and Ward*, an abridgment of the above (ib., 1864).

MARSH MARIGOLD, *Caltha*. A genus of plants of the family Ranunculaceæ. *Caltha palustris*, usually called cowslip in the United States, is a very common American plant, with kidney-shaped, shining leaves and large yellow flowers, a principal ornament of wet meadows and the sides of streams in spring. It partakes of the acidity common to the order; but the flower buds, preserved in vinegar and salt, are said to be a good substitute for capers. The plant is used before flowering as a potherb

MARSH MARIGOLD (*Caltha palustris*).

in many places. A species, *Caltha natans*, occurring in ponds from Minnesota northwestward, has white or pink flowers.

MARSH PLANTS. See SWAMP.

MARSH ROSEMARY. A name given to several species of *Statice* or *Limonium*, members of the family Plumbaginaceæ. *Statice limonium*, a perennial plant, grows in salt marshes along the seashore of southern and western Europe, and *Limonium carolinianum*, an American plant, grows in similar localities on the American coast. Marsh rosemary has a tuft of spatulate oblong, bristly pointed, one-ribbed leaves, developing in August a much-branched, paniced scape, from 1 to 2 feet high, bearing numerous small lavender-colored flowers.

MARSH'S TEST. See ARSENIC.

MARSH TREFOIL. A plant widely distributed in northern latitudes. See BUCK BEAN.

MARSH WREN. A wren that inhabits reedy marshes. In the United States and Canada two species are more or less numerous wherever such marshes occur. The most familiar one along the Atlantic coast is the long-billed marsh wren (*Telmatoodytes palustris*), while the short-billed (*Cistothorus stellaris*) is more numerous in the interior of the country. Both are brownish above and light colored below, with little to distinguish them besides the marked difference in the length of the bill; but the long-billed is the larger. Both species are migratory, and are notorious for their excited activity, micelike manners, and rippling prattling song. They construct large globular nests, suspended among

the reeds, woven of grass blades and entered by a little hole in the side. As often happens among other wrens (see WREN), many more nests will be built each season than there are pairs in the locality, some of which may be utilized as sleeping places by the cock birds. The nests of the two species are much alike, but the eggs are very distinct, those of the long-billed being dark chocolate in color, while those of the short-billed are pure white.

MAR'SI. 1. An ancient tribe of central Italy, inhabiting the district around Lake Fucinus (Lago di Celano, now drained). Their origin, like that of other Italian tribes, is involved in obscurity and fiction. They were probably of Sabine origin, but spoke a dialect akin to the Latin. They are worthy of notice chiefly on account of their warlike spirit. The Marsians were at one time allies of the Romans, but in 308 B.C. they revolted and joined the Samnites. After being subdued they again (301 B.C.) shook off the alliance of Rome, but were beaten in the field and lost several of their fortresses. From this time they continued the firm allies of Rome, contributing by their valor to her triumphs until the Italians were aroused in 91 B.C. to demand redress of their wrongs and a share in the privileges of Roman citizens. A war ensued, generally known as the Social War (q.v.), but frequently called the Marsic War, because the Marsi were prominent among the malcontents. Their leader was Pompædus Silo. Though they were often defeated, the perseverance of the allies gained, in 87 B.C., the object for which they had taken up arms—enfranchisement as Roman citizens. The Marsians, inhabiting a mountain district, were temperate in their habits, brave, and unyielding. So marked was their valor that there was a proverbial saying recorded by Appian, "that Rome had achieved no triumph over the Marsi, or without the Marsi." The ancient Marsi were represented as enchanters, able to tame serpents and to heal their bites; and it is worthy of note that the jugglers who now amuse the people by handling serpents are natives of the region in the vicinity of Lago di Celano. Inscriptions found at the southwest corner of Lake Fucinus testify to the existence there of a temple and grove of Angitia, a goddess of healing, especially skilled in curing, by charms and herbs, the bites of serpents. Their only important town was Marruvium (San Benedetto), the ruins of which are still visible. Consult: Sophus Bugge, *Italische Landet Kunde* (Christiania, 1878); R. S. Conway, *The Italic Dialects* (Cambridge, 1897); and the article "Marsi" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914). See ITALIC LANGUAGES.—2. An ancient people of Germany, according to Tacitus, *Germania*, chap. ii. In books i-ii of his *Annales* Tacitus makes the Marsi an important tribe or group of tribes between the rivers Lippe and Ruhr, perhaps near Dortmund. They fought with Germanicus. See GERMANIA; GERMANICUS CÆSAR.

MARSIAN (mār'si-an) **WAR.** See SOCIAL WAR.

MARSICK, mār'sik', MARTIN PIERRE JOSEPH (1848—). A Belgian violinist and teacher, born at Jupille, near Liège. His earliest professional instruction was at the Désire-Heynberg Conservatory at Liège. His musical precocity was such that at 12 years of age he was organist of the Liège Cathedral. At 17 years of age he

became a pupil of Léonard at the Brussels Conservatory, and a year later entered the Paris Conservatory, where he studied under Massart and won the first prize for violin playing. He completed his student course under Joachim at Berlin, and in 1873 made a very successful début at the "concerts populaires." He became a member of the faculty of the Paris Conservatory in 1892, succeeding Massart as professor of violin. His compositions are almost entirely for the violin and are very popular on the French concert platform. In 1895-96 he toured the United States and confirmed the reputation that had preceded him.

MARSIGLI, mār-sē'lyē, LUIGI FERDINANDO, COUNT (1658-1730). An Italian soldier and scholar, born at Bologna. He rose from the ranks to be general in the Austrian army. After the fall of Altbreisach (1703), where he was second in command, he was degraded by court-martial and was never entirely reinstated, though generally considered innocent. Thereafter Marsigli devoted himself to scientific explorations and founded the Institute of Science and Arts at Bologna (1714). In connection with it he established a press for printing its reports. His works include: *Osservazione intorno al Bosforo tracio* (1681); *Storia del mare* (1711); *Danubius Pannonico-Mysicus* (1726); *Stato militare dell' imperio ottomano* (1732).

MARSIGLIO, mār-sē'lyō. See MARSILIUS.

MARSIL'EA/CEÆ. One of the two families of water ferns, the other being the Salviniaceæ (q.v.). The family comprises the two genera *Marsilea* and *Pilularia*, whose species root in the mud, either under water or in muddy flats. The stem is prostrate and gives rise to a series of leaves, whose blades reach the surface of the water. The leaf of *Marsilea* has a long petiole bearing four wedge-shaped leaflets, peltately arranged, and resembling a four-leaved clover, except that the veins are forking. The fruit body (sporocarp) of *Marsilea* is somewhat bean-shaped, and is borne on a stalk that arises from the petiole, which represents a branch of the leaf bearing and inclosing the sporangia.

MARSILI, mār-sē'lē, LUIGI (c.1330-94). An Italian humanist. He was born at Florence and there entered the Augustinian convent of Santo Spirito. He studied theology at Paris, on the advice of Petrarch, who wished him to become a Christian champion against the Averroists. Santo Spirito under Marsili became the seat of a society for classical study and discussion; among its members was Coluccio Salutati. Marsili was employed in several diplomatic errands by the city of Florence. His manuscript comments on Petrarch's poems were preserved at the Laurentian Library. Consult Rossi, *Il quattrocento* (Milan).

MARSILI'US, or **MARSIGLIO**, mār-sē'lyō, OF PADUA (c.1270-c.1343). A Christian polemic. He was born in Padua and studied medicine there. Later he taught philosophy at Paris and became rector of the university in 1313. There between 1324 and 1326 he produced, in conjunction with John of Jandun, the treatise on jurisprudence which gives him his lasting fame, the *Defensor Pacis*, an arraignment of the "usurpations," as he terms them, of the Roman pontiff. The way to peace, he maintains, is for the spiritual power to give up its claim to rule the temporal power. He argues for a virtual separation of Church and state, and pleads in singularly modern language for religious liberty and the

equality of the clergy. He denies the right of the Church to punish heresy. He accompanied his patron, Louis of Bavaria, in his conquest of Rome (1328), where for a short time his ideas were put into practice. His book was printed and published at Basel (1522). The anonymous editor was probably the printer Valentinus Curius, though some think he was Huldreich Zwingli. It was translated by William Marshall (London, 1553).

MARSIPOBRANCHII, mār'sip-ō-brān'ki-i. A class of fishlike animals, the lampreys, with a cartilaginous skeleton and the skull imperfectly developed. See CYCLOSTOMI.

MARSIVAN, mār'sē-vān'. A town of Asia Minor in the Vilayet of Sivas, situated among gardens and vineyards, 56 miles south of the Black Sea (Map: Turkey in Asia, C 2). It is the seat of Anatolia College, an institution with which a Protestant theological seminary and an American hospital are connected, the three institutions having a student body of over 700. The city also contains Jesuit and Armenian schools. In the neighborhood are a silver mine and hot mineral springs. It is a prosperous town with a population of about 25,000, most of them Moslems.

MARS-LA-TOUR, mār's-lā-tōor'. A village of France, in the Department of Meurthe-et-Moselle, 12 miles west-southwest of Metz. It is noted for the bloody cavalry battle which took place there between the French and Germans, Aug. 16, 1870, better known as the battle of Vionville (q.v.).

MARSTON, JOHN (?1575-1634). An English dramatist, belonging to the Marstons of Shropshire. He was born probably at Coventry about 1575. In 1594 he graduated B.A. from Brasenose College, Oxford, and very soon, it would seem, studied law. Turning to literature, he published in 1598 *The Metamorphosis of Pigmaliions Image*; and *Certain Satyres*, and *The Scourge of Villanie: three Books of Satyres*. The first, *Pigmaliions Image*, is an amatory poem, written, the author asserted, to bring into disrepute the whole species. The satires, some of which are devoted to a quarrel between Marston and Joseph Hall, are coarse and brutal. On the other hand, they are not wanting in vigor and point. Most famous are the lines in which Marston dedicates himself to everlasting oblivion. The earliest trace of Marston as a playwright is in Henslowe's Diary (Sept. 28, 1599). His extant tragedies comprise: *Antonio and Mellida* and *Antonio's Revenge* (1602); *The Malcontent* (1604); *Sophonisba* (1606); *The Insatiate Countess* (1613), which, however, is sometimes assigned to William Barksteed. His comedies comprise: *The Dutch Courtezian* (1605); *Parasitaster*, or *The Fawne* (1606); *What You Will* (1607). As he often collaborated, his hand is also discernible in several other plays. In conjunction with Chapman and Jonson he wrote *Eastward Hoe* (1605); and on account of certain offensive passages he and Chapman were sent to prison, where Jonson voluntarily joined them. Before this Marston and Jonson had quarreled, but they were now reconciled. The comedies are lively and entertaining. The tragedies contain passages of power and beauty, but they tend too much to bombast, coarseness, and the gross horrors of the tragedies of blood. The best is *The Insatiate Countess*. In middle life Marston left the stage and entered the Church. From 1616 to 1631 he

held the living of Christchurch in Hampshire. He died in London, June 25, 1634. Marston's *Workes* were first published in London, in 1633. The *Works*, edited by J. O. H. Philipps, appeared in 1856 (3 vols., London); and, edited by A. H. Bullen, in 1887 (3 vols., ib.). The *Poems*, edited by A. B. Grosart, appeared in 1879 (2 vols., ib.). Consult also: F. G. Fleay, *Biographical Chronicle of the English Drama, 1559-1642* (London, 1891); "John Marston als Dramatiker," in *Englische Studien*, vols. xx, xxi (Heilbronn, 1895); W. M. Dixon, in *Cambridge History of English Literature*, vol. vi (Cambridge, 1910).

MARSTON, JOHN WESTLAND (1819-90). An English dramatic poet, born in Lincolnshire. He studied law, but left that profession for literature. He published *Gerald and Other Poems* (1842), besides some novels and short stories, and was long a contributor to the *Athenaeum*. His principal literary activity, however, was in the field of dramatic literature. Among his numerous plays are: *The Patrician's Daughter* (1841), a tragedy; *Strathmore* (1849); *Ann Blake* (1852); *A Hard Struggle* (1858); *Donna Diana* (1863), his best play; *The Favorite of Fortune* (1866); *A Hero of Romance* (1867); *Life for Life* (1869).

MARSTON, PHILIP BOURKE (1850-87). An English poet, born in London. From early childhood he suffered a partial loss of sight which ultimately became complete blindness. Besides vision he lost friends, relatives, and fortune, the whole serving to develop in his verse a vein of unvaried sadness. His sonnets and lyrics are highly esteemed for technical excellence. It is generally believed that he was the subject of Mrs. Craik's *Philip, My King*. He is the subject of an elegy by Swinburne. He published three volumes of poetry: *Song Tide and Other Poems* (1871); *All in All* (1875); *Wind Voices* (1883). There were posthumously published a collection of stories, edited by W. Sharp and called *For a Song's Sake and Other Stories* (1887); and, in verse, *Garden Secrets* (1887) and *A Last Harvest* (1891), both edited by Mrs. Louise C. Moulton. Consult Coulson Kernahan, in *Sorrow and Song* (Philadelphia, 1894), and William Sharp, in *Papers Critical and Reminiscent* (New York, 1912).

MARSTON MOOR. A plain in Yorkshire, England, where, July 2, 1644, the Royalist army, under Prince Rupert, was beaten by the Parliamentary forces, English and Scottish, under Fairfax, the Earl of Manchester, and the Earl of Leven. The approach of Rupert forced Fairfax to abandon the siege of York, and he took up his position on Marston Moor, with about 25,000 men. Rupert, with about the same number, came up with him on the afternoon of July 2; and in the evening, at the head of the Royalist right, he made a fierce charge upon the Parliamentary left, which broke and fled in disorder. The Parliamentary centre had likewise been broken by the infantry of the Royalist centre and had suffered heavily; but while the Royalists were dispersed in search of plunder or in pursuit of the enemy, Cromwell's famous Ironsides brigade, with the Scottish regiments, commanded by David Leslie, and some others, rallied, charged the Royalists vigorously, and remained masters of the field, capturing 1500 prisoners and all the Royalist artillery. The killed on the Royalist side numbered 4000 and the wounded about as many more; on the Parlia-

mentary side the losses numbered only a few hundred. This victory resulted in the occupation of York and the control of the whole North of England by the Parliamentary forces. Consult S. R. Gardiner, *History of the Great Civil War* (London, 1901), and J. W. Kennedy, *The Scottish Borderers at Marston Moor, 1644* (Hawick, Scotland, 1902).

MARSTRAND, mär'strän, VILHELM NIKOLAI (1810-73). A Danish genre painter, born in Copenhagen. Here he studied at the Academy and under Eckersberg, but at an early stage worked independently and won success with such subjects as a "Sleigh Drive by Torchlight" (1829) and a "Musical Party" (1834), of special interest as containing numerous portraits from the musical world. In 1836 he went to Rome, where he joined the circle that centred about Thorvaldsen and where, with others, he painted an "Episode in the October Festival at Rome" (1840, Thorvaldsen Museum, Copenhagen). After visiting Florence he passed a year in Munich and returned home in 1841. Prominent among his productions during the next decade were a "Scene from Danish Peasant Life" (after Holberg) and "Childbed Room" (1846), both in the Copenhagen Gallery, and "Pothouse Politicians" (1852, Hamburg Gallery), besides other episodes and characters from the plays of Holberg. On a trip through Sweden he sketched hundreds of studies, embodied afterward in "A Sunday in Dalecarlia" (1853, Copenhagen Gallery). His keen powers of observation and characterization, his healthy, wholesome satire, and freshness of ideas have assured Marstrand a unique position in Danish art. His versatility was also remarkable and after repeated visits to Italy he painted portraits, religious and historical subjects. His success in the latter field is evidenced by his mural paintings in the mortuary chapel of Christian IV at Roeskilde and "Foundation of Copenhagen University," in the Aula of that building. His illustrations to *Don Quixote* constitute part of his most meritorious work. He was appointed professor at the Copenhagen Academy in 1848 and director in 1853.

MARSTRANDER, mär-strän'dër, CARL JOHAN SVERDRUP (1883-). A Norwegian philologist, born at Christiansand. He was educated at the University of Christiania, became a lieutenant in the army, but took up the study of languages—comparative philology and (from 1906) Celtic being his specialties. In 1907 he went with government scholarship to Ireland, in 1908 became stipendiary in comparative philology at the University of Christiania, and in 1910 was appointed professor of Celtic and comparative philology in the School of Irish Learning at Dublin. He published Irish texts and scientific essays in *Zeitschrift für celtische Philologie*, *Indogermanische Forschungen*, *Christiania Videnskabs-Selskabs Skrifter*, and especially in *Erin*, of which he became one of the editors. He was also appointed editor of the large *Irish Dictionary* of the Royal Irish Academy, Dublin, and edited, with Osborn Bergin, *Miscellany to Kuno Meyer* (Halle, 1912).

MARS ULTOR, TEMPLE OF. See AUGUSTUS, FORUM OF; MARS, Roman.

MARSUPIAL FROG (from Lat. *marsupium*, from Gk. *μαρσιπιον*, *marsipion*, dim. of *μαρσιπος*, *marsipos*, *μαρσιππος*, *marsippos*, *μαρσυπος*, *marsypos*, pouch). A tree frog of the South American genus *Nototrema*, which is peculiar

among the Hylidæ in that the female has a pouch on her back for the reception of the eggs. This pouch forms two blind sacs made by infolding of the skin, which extend forward over the back; but in one species the opening is longitudinal. The eggs are few in number and of large size, with much food yolk, for in most species the embryos remain in the pouch until they are fully matured. How the eggs get into the pouch is not known, but Gadow thinks it most likely that they are placed there by the help of the male immediately after fertilization. Five or six species of these small, brightly colored frogs have been described from the tropical forests of Venezuela and the upper Amazon. Consult Hans Gadow, *Amphibia and Reptiles* (London, 1901).

MARSUPIALIA. The marsupials form one of the great subdivisions of the class Mammalia, and are of special interest because of their ancestral history and relationships and their remarkable geographical distribution. Although ranked as an order, Marsupialia is coextensive with the subclass Metatheria (q.v.). Its principal characters are as follows: the brain is small, with the surface folding absent or very simple, the corpus callosum rudimentary, and the cerebellum completely exposed. Epipubic bones are present in both sexes, and there are other important skeletal characters, prominently a tendency to the separation of bones ankylosed in the higher Eutheria. The mammary glands are provided with long teats, and are usually inclosed in a marsupium or pouch, which serves to protect the helpless young. The imperfection or absence of the pouch is found only among the Koalas, who grow and suckle on the mother's teat after postnatal removal, the young being protected only by the hair of the mother's abdomen. The young when born are very minute and undeveloped. They are not merely imperfect fetuses, but actual larvæ, inasmuch as they are provided with a special sucking mouth, in adaptation to their needs, which is later replaced by a true mouth. The young when born are transferred by the lips of the mother to the pouch, where they are placed upon a teat to which the temporary sucking mouth clings; and, as they are unable to suck, the milk is injected into them by the action of special muscles of the mammary gland. (See GLAND.) The organs of reproduction are peculiar to the group, which is often called Didelphia in reference to their character. The oviducts never unite to form a uterus and the vagina is always double, at least in part; the testes hang suspended in front of the penis and the glands of the latter is often bifurcate. The anus and urinogenital opening are surrounded by a common sphincter muscle. It was formerly supposed that no allantoic placenta was present in the group, but it is now known to exist in some bandicoots (*Perameles*). The egg is minute, as in Eutheria, but incompletely divides at first.

In dentition and habits as great a variety exists among the marsupials as in all the rest of the mammals together, for carnivorous, herbivorous, insectivorous, and omnivorous forms are all well known, including arboreal, terrestrial, cursorial, leaping, and burrowing forms. In distribution, one family, the Didelphyidæ (opossums), is peculiar to the American continent, where it is spread from New York State to Patagonia; only two of the 23 species, however, occur north of Mexico. Opossums are the most

MARSUPIALS

1 KANGAROO — *MACROPSUS GIGANTEUS*
2 OPOSSUM — *DIDELPHYS VIRGINIANA*

4 TASMANIAN WOLF — *THYLACINUS CYNOCEPHALUS*
 $\frac{1}{2}$ NATURAL SIZE

primitive of all the marsupials and are thought to resemble closely the ancestral stock from which came the living members of this infraclass. All the other marsupials (except one) are confined to the Australasian region, where they completely dominate all other mammals and form the most characteristic feature of the fauna. Their survival and prosperity in Australia are doubtless due to the entire absence there of destructive carnivores, except the dingo, of doubtful antiquity; and they have become diversified within their limited circumstances in the same way as have the larger company of mammals all over the world, to enable them to utilize all possible advantages. The fact of marsupials existing in America, and especially in the Neotropical region, has excited much speculation as to how they came there, so remote from Australia. Geographical researches show that during the Mesozoic age marsupials inhabited Europe and North America, but none of that period have been found in Australian rocks. These oldest ancestors of the race appear to have been mainly of the polyprotodont type, little differentiated from the diprotodonts, however; and either this differentiation occurred very long ago (in Jurassic or Cretaceous times) or the latter is a condition which has arisen, as Beddard suggests, independently in both South America and Australia. At any rate, before the Tertiary age was finished pouched marsupials disappeared from the Northern Hemisphere and survived only in Australasia and South America. The hypothesis of a former land connection between Australia and Patagonia is still a moot question. It seems probable that in early Tertiary times there must have been a land connection by way of the Antarctic continent. The most eminent authorities differ on this point. It is interesting to know that a diprotodont (see OPOSSUM RAT) exists in Patagonia.

The relationships of marsupials have become much better understood than formerly. The name Metatheria was originally given with the idea that this group was intermediate between the Prototheria (monotremes) and higher Eutheria, and in a sense this is true, but the former belief that it represents a stage of development from the Prototheria to the monodelphic mammals is not now accepted. The distinctions between the marsupials and the Monotremata are fundamental, and there is no evidence of the derivation of the two branches from any common source. On the contrary, as Beddard concludes in a learned review of the subject, the great specialization of the structure of the marsupials (including evidence of degeneration), and their age, point to the fact that they are the descendants of an early form of eutherian mammal, since the time when the stock had acquired diphidy and the allantoic placenta. See the article MAMMALIA.

Classification. Rather less than 150 species are known, but they exhibit a most extraordinary variety of size, form, and color. The classification of the marsupials is based primarily upon the dentition, although the characters of the feet have been given much weight recently. There are two principal groups, the *Polyprotodontia*, which have numerous small, subequal incisor teeth, and the *Diprotodontia*, which have not more than six incisors in each jaw and usually have only two in the lower jaw. The former includes the opossums, Tasmanian wolf and "devil," the dasyures, bandicoots, and the

like; while in the latter are the wombats, phalangers, koala, and kangaroos. Descriptive articles will be found under each of these terms and the related words.

Bibliography. In addition to standard works and books descriptive of Australia consult the folio volumes with colored plates by John Gould, *Monograph of the Macropodidae* (London, 1841); C. R. Waterhouse, "Marsupialia or Pouched Animals," in William Jardine, *Naturalists' Library*, vol. xxiv (Edinburgh, 1855); John Gould, *Mammals of Australia* (3 vols., London, 1863); Gerard Krefft, *Mammals of Australia* (Sydney, 1871); Oldfield Thomas, *Catalogue of Marsupialia and Monotremata in the British Museum* (London, 1888); F. E. Beddard, *Mammalia* (ib., 1902); W. K. Gregory, "Orders of Mammals," in *American Museum of Natural History, Bulletin*, vol. xxvii (New York, 1910); Parker and Haswell, *Text-Book of Zoölogy* (ib., 1910); W. B. Scott, *History of Land Mammals in the Western Hemisphere* (ib., 1913).

MARSUPIAL MOLE (*Notoryctes typhlops*). A small burrowing marsupial of central southern Australia. The marsupial mole is in no way connected with the European mole, but nevertheless has acquired many similar habits, affording a valuable lesson in parallelism in development. Consult Beddard, *Mammalia* (London and New York, 1902).

MARSUPPINI, mār'sōop-pē'nē, CARLO. See ARETINO, CARLO.

MAR'SUS, DOMITIUS (c.54 B.C.-c.4 B.C.). A Roman poet of the Augustan age. He seems to have been a friend of Mæcenas (Martial, viii, 56, 21), and of Vergil and Tibullus, but he is not mentioned by Horace. His works include: *Cicuta*, Hemlock, a collection of epigrams; *De Urbanitate*, a treatise, bitterly satirical, on the use of wit, in oratory, which is quoted by Quintilian; *Amazonis*, an epic; and erotic elegies and fables. He is frequently mentioned by Martial (iv, 29, 7; vii, 29, 7), who praises the wit and severity of his satire. The few fragments of his works may be found in Bährens, *Fragmenta Poetarum Romanorum* (1886). Consult: J. A. Weichert, *Poetarum Latinorum Vita et Reliquiae* (1830); R. Unger, *De Domitii Marsi Cicuta* (Friedland, 1861); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910); M. Schanz, *Geschichte der römischen Literatur*, vol. ii, part i (3d ed., Munich, 1911).

MAR'SYAS (Lat., from Gk. Μαρσῖας). One of the Sileni of Asia Minor, and therefore at once a spirit of the water (perhaps originally god of the river Marsyas: see below) and of music, especially of the flute, which was associated with the worship of the great goddess Cybele (q.v.), as whose devoted servant Marsyas appears in the Phrygian legend. Thus he is called the son of Hyagnis (to whom was attributed sometimes the invention of the flute), and a teacher of Olympus, to whom the development of the art was assigned. Under Greek and especially Attic influence other features were added to the legend. Athena, so ran the story, had invented the flute, but, observing the reflection of her distorted face as she played on the flute, threw it from her. It was found by the Silenus, or satyr, Marsyas, who became so skillful in its use that he ventured to challenge the god of the cithara, Apollo, to a musical contest. Here two versions follow. According to one, King Midas as judge gave the decision to Marsyas, whereupon Apollo bestowed on the

umpire asses' ears for his poor judgment. In the other version the muses were the arbiters, and gave the decision to Apollo, as his instrument allowed him to add song. In both versions the god hung his presumptuous rival to a tree and flayed him alive, or caused him to be flayed by a Scythian slave. At Celanæ in Phrygia Marsyas was worshiped at the cavern whence flows the tributary of the Mæander that bears his name, and here also was shown his skin, which had been hung up in warning by the victorious god. In the Forum at Rome and in Roman colonies statues of Marsyas were set up as a symbol of liberty. Marsyas was a favorite figure in art. The Athenian sculptor Myron made a famous group of Athena and Marsyas, of which the latter figure seems reproduced in a marble statue in the Lateran, which represents Marsyas as picking up the flute. Another celebrated group is represented by the statue of Marsyas hung from the tree, and the celebrated Florentine figure of the Scythian whetting his knife to flay Marsyas (found at Rome in the 16th century); of the other figures of this group no certain copies have been identified. The competition was also represented on the base of the statues of Leto, Apollo, and Artemis at Mantinea, by Praxiteles, and of this composition three of the four slabs are now in the Museum at Athens.

MART. A city in McLennan Co., Tex., 19 miles by rail east of Waco, on the International and Great Northern Railroad (Map: Texas, D 4). It is in a productive cotton region, and has large cotton gins, oil mills, and compresses. The city contains also a fine high-school building and railroad repair shops. The water works are owned by the municipality. Mart has adopted the commission form of government. Pop., 1910, 2939.

MARTEAU, mār'tō', HENRI (1874-). A French violinist, born at Rheims. He studied with Léonard and, after the latter's death in 1891, entered the Paris Conservatory, where in the following year he won the first prize. From 1892 to 1894 he toured the United States with emphatic success. His tours of Scandinavia from 1894 to 1899 were equally successful. In 1900 he was appointed professor in the conservatory at Geneva, and in 1908 he succeeded Joachim at the Königlische Hochschule in Berlin. He published some meritorious chamber music and a scena for soprano, chorus, and orchestra.

MARTEL, CHARLES. See CHARLES MARTEL.

MARTEL, mār'tēl', LOUIS JOSEPH (1813-92). A French politician, born at Saint-Omer. He studied law, entered politics, and was elected to the Legislative Assembly of 1849 from Pas-de-Calais. He protested strongly against the coup d'état of 1851. He was a member of the Corps Législatif from 1863 to 1870; in 1871 was elected to the National Assembly, and was vice president of the Chamber. In 1875 he was elected life member of the Senate; in 1876 he became vice president of the Senate, and in 1876-77 he was Minister of Justice and Public Instruction. In 1879-80 he was again president of the Senate.

MARTEL DE JANVILLE, de zhār'vél', GABRIELLE, COUNTESS DE (1850-). A French author, born at the château of Coëtal (Morbihan), and better known by her pen name, Gyp. She was the great-grandniece of Mirabeau, and married Count Martel de Janville in 1869. She created the essentially Parisian characters Petit Bob, Loulou, and Paulette, types of a

more or less risqué society, which she describes in witty dialogue, and with piquant satire. Her very numerous novels (133 in 31 years) include: *Petit Bob* (1882); *Autour du mariage* (1883); *Un homme délicat* (1884); *Elle et lui* (1885); *Autour du divorce* (1886); *Pour ne pas l'être?* (1887); *Pauvres petit' femmes* (1888); *Bob au salon* (1888); *Mademoiselle Eve* (1889); *Bob à l'exposition* (1889); *L'Éducation d'un prince* (1890); *Monsieur Fred* (1891); *Mariage civil* (1892); *Du haut en bas* (1893); *Mariage de chiffon* (1894); *Le cœur d'Ariane* (1895); *Le bonheur de Ginette* (1896); *Totote* (1897); *Israël* (1898); *L'Entrevue* (1899); *Le pays des champs* (1900); *Le friquet* (1901); *Sœurlette* (1902; 2d ed., 1910); *Un ménage dernier cri* (1903); *Maman* (1904; 2d ed., 1910); *Le cœur de Pierrette* (1905); *Ces bons Normands* (1907); *La paix des champs* (1908); *Joies d'amour* (1909); *L'Amoureux de Line* (1910); *La guinguette* (1911); *Le grand coup* (1912); *Napoléonnette* (21st ed., 1913).

MARTELÉ, mār'te-lâ' (Fr., hammered). In music, a direction for bow-instruments, indicating that notes so marked are to be played with a clean, decided stroke. When the term is used in piano music it means that the keys are to be struck heavily and firmly.

MARTELLO TOWER. A round masonry tower designed to form part of a system of coast defense. The original Martello tower was situated in the Gulf of San Fiorenzo, Corsica, and was named after its inventor. In 1794 two British war ships unsuccessfully attacked it, with loss to themselves; this single experience, it is said, leading afterward to the adoption of Martello towers by the English. They were erected along the more exposed parts of the south coast and the south and southeastern coasts of Ireland. They were determined on and built hurriedly during the Napoleonic wars, owing to fear of a French invasion. They are about 40 feet high, solidly built, and situated on or near the beach. The walls are five and one-half feet thick and were supposed to be bomb-proof; the base formed the magazine, the garrison occupied the two upper rooms, and the swivel heavy gun and its accompanying howitzers were placed on the roof. They were a great expense to the nation, and have always been regarded as worthless. They are now dismantled and, except in the few instances where they are utilized by the coast guard, abandoned.

MARTEN (Fr. *martre*, *martre*, from ML. *martus*, *marturis*, *mardarus*, *mardalus*, *mardarius*, from OHG. *mardar*, Ger. *Marder*, from OHG. *mart*, AS. *mearp*, *marten*; probably connected with Lith. *martis*, bride). Either of two species of fur-bearing animals of the genus *Mustela*, which also contains the sables. The body is elongated and supple, as in weasels, the legs short, and the toes separate, with sharp, long claws. The nose is grooved and the ears are shorter and broader than in weasels, and the tail is bushy. The martens exhibit great agility and gracefulness in their movements and are very expert in climbing trees, among which they generally live, furnishing a lofty hollow in a decaying trunk with a bed of leaves. Here the young are brought forth in litters of six to eight early each spring; but in a mountainous country all will make dens, sometimes in crevices of rocks.

The term marten is somewhat indefinite, but is most applied in America to the animal which is the nearest analogue to the Old World sable

(q.v.), and hence is frequently called the American sable or pine marten: technically it is *Mustela americana*. This species, which for 250 years has supplied the most valuable of the American furs gathered from its tribe, originally had a range wherever forests grew from New Jersey and Pennsylvania to Labrador and Hudson Bay, and from Colorado and central California to the barren grounds of the Arctic coast; and it was so plentiful that periodically it overflowed certain districts and spread in hordes, scattering far and wide in search of food. On the other hand, periods of astonishing scarcity of martens occur every eight or ten years, no cause for which is known. The incessant trapping which goes on in the wilderness has of course considerable effect in diminishing their numbers, and this species everywhere disappears before the approach of civilization. They keep mostly to the trees, and hence like the denser parts of the forest, but they constantly descend to the ground for food, especially in winter, when they regularly hunt for hares and grouse of all kinds, trailing them with nose to the track like hounds. Their broad feet enable them to move rapidly, even over soft snow. They also hunt persistently for squirrels, chase them in the trees and on the ground, and enter their nests. To this diet are added whatever mice and birds and small fare come their way.

Martens have little to fear from native foes; the much larger fisher is said to kill them occasionally, and it is not improbable that the great horned owl now and then manages to pounce on one, but very few of the carnivores care to taste their flesh unless driven to it by extreme hunger. They are trapped from November until towards March, when their coat begins to become ragged and dull in hue, and with the approach of the rutting season they are no longer attracted by the baits offered by trappers. This species averages about 18 inches in length of head and body, plus seven to eight inches of tail. Its highly variable tints may be described as rich brown, somewhat lighter below. The winter fur is full and soft, an inch and a half deep, and has sparsely scattered through it coarse black hairs which the furrier pulls out. The tail has longer hairs, but is less bushy than that of the fisher. The distinction between this animal and either the European pine marten or the Asiatic sable is visible only to an experienced eye, and it is only recently that naturalists have agreed to regard them as specifically distinct. Four closely related species are recognized in North America, while the best known (*americana*) is divided into six subspecies.

A much larger, very distinct American form, unlike anything in the Old World, is Pennant's marten (*Mustela pennanti*), the "pekan" of French-Canadian trappers and commonly known to Americans as the "black cat" or "fisher," the latter an erroneous name, since the animal never catches fish. It is the largest of its race, and is described under FISHER. For illustration of the pine marten see Plate of FUR-BEARING ANIMALS. Three other species are natives of western Europe, including the now rare and restricted pine or sweet marten (*Mustela* or *Martes martes*) and the more common beech or stone marten (*Mustela* or *Martes foina*), which is not an inhabitant of Great Britain. The habits of both are substantially the same as have been described above, and they differ mainly in the pine marten having (like the American form) a

yellowish throat and chest, while that of the beech marten is white. Consult: Elliott Coues, *Fur-Bearing Animals* (Washington, 1877); Sir H. H. Johnston, *British Mammals* (London, 1903); E. T. Seton, *Life-Histories of Northern Animals* (New York, 1909).

MARTEN, HENRY (1602-80). An English regicide. He studied at University College, Oxford, and in 1640 became a member of Parliament. There he joined the extremists of the popular party, and as early as 1643 urged the extirpation of the entire royal family. For this he was expelled from the House. In 1646 permitted to return to Parliament, he again urged extreme action against the King. He was at odds with Cromwell for a time, but later co-operated with him in bringing about the King's trial, at which he was one of the leading judges. He was especially active in establishing the Republic, and he continued to have great influence in Parliament during the Protectorate. Upon the Restoration he gave himself up as a regicide in 1660, was tried and found guilty, but was not executed. He died in prison.

MARTÈNE, mâr'tân', EDMOND (1654-1739). A Roman Catholic scholar. He was born at Saint-Jean-de-Lôsne, near Dijon; became a Benedictine monk at 18, and joined the famous Congregation of St. Maur. He spent his life in the service of learning, searching the libraries of Germany, France, and the Netherlands, the fruits of the search appearing in many works, notably in the new edition of the *Gallia Christiana* (14 vols., 1715-56); *Commentarius in Regulam Sancti Patris Benedicti* (1690); *Thesaurus Novus Anecdotorum* (1717); *Veterum Scriptorum et Monumentorum Historicorum Dogmaticorum et Moralium Amplissima Collectio* (1724-33); *Annales Ordinis S. Benedicti*, vol. vi (Paris, 1739).

MARTENS, mâr'tens, FEDOR FEDOROVITCH, or FRIEDRICH FROMMHOOLD VON (1845-1909). A Russian writer on international law, born at Pernau in Livonia. He studied law at the universities of St. Petersburg, Vienna, Heidelberg, and Leipzig. In 1868 he became an official of the Ministry for Foreign Affairs and thereafter continued to be an active and influential figure in matters of foreign diplomacy. In 1873 he was appointed professor of public law at the university of St. Petersburg. He took part in the Brussels conference for the codification of martial law (1874). In 1884 and 1887 he was a member of the Red Cross conferences. In 1889 he represented Russia at the Brussels conference for commerce and maritime law. He was intrusted with the office of arbitrator between England and France in the New Zealand question in 1891, and two years afterward he was a delegate to The Hague conference on arbitration. He was chosen vice president of the Institute of International Law at The Hague in 1894. In 1905 he was legal adviser to the Russian peace plenipotentiaries at Portsmouth. His publications include: *Recueil de traités et conventions conclus par la Russie avec les puissances étrangères* (1874-1909); *Das Consularwesen im Orient* (Ger. trans., 1874); *La Russie et l'Angleterre dans l'Asie Centrale* (1879); *La question égyptienne* (1881); *La conférence africaine de Berlin* (1885); *La paix et la guerre* (Fr. trans., 1901); and his famous treatise on international law (1882), which is available in French and German translations.

MARTENS, GEORG FRIEDRICH VON (1756-

1821). A German publicist and diplomat, born at Hamburg. He studied at the universities of Göttingen, Strassburg, and Vienna. From 1783 to 1789 he was professor of law at Göttingen. In the latter year he was ennobled. In 1808 he entered into the Westphalian civil service as Councilor of State and after 1810 as head of the finance department. After the restoration, he was made Privy Councilor by the King of Hanover. Martens's chief literary work is *Recueil de traités* (7 vols., 1791-1801; 4 suppl. vols., 1802-08); *Nouveau recueil* (1817-42; continued by Karl von Martens and others); but he acquired special fame by his *Précis du droit des gens modernes de l'Europe* (1789; 3d ed., 1821; rev. by Pucheiro-Ferreira, 1864).

MARTENSEN, HANS LASSEN (1808-84). A Danish theologian and bishop. He was born at Flensburg, Schleswig, Aug. 19, 1808; studied theology at the University of Copenhagen; and in 1840 became professor at the university, first in philosophy and afterward in theology. In 1845 he was appointed preacher to the Danish court, and in 1854 elevated to the bishopric of Seeland, the highest dignity of the Danish church. In this position, by his eminent scholarship, his catholic spirit, and his tireless activity, he exerted a powerful and beneficent influence. His writings show a modified mysticism, the result of his study of the mediæval mystics. He died in Copenhagen, Feb. 3, 1884. His works include: *Mester Eckart* (1840), an essay on the mysticism of the Middle Ages; an *Outline of a System of Ethics* (1841); *Christian Dogmatics* (1849; 5th ed., 1904; Ger., French, Swed. trans.; Eng. trans., 1866); a *System of Christian Ethics* (1871-78; Ger., Swed. trans.; Eng. trans., 1873-82), his main work; *Katolicisme og Protestantisme* (1874); *Jakob Böhme* (1882; Eng. trans., 1885); an autobiography (Ger. trans., *Aus meinem Leben*, 1883-84). Consult also his correspondence with Dörner, *Briefwechsel mit L. A. Dörner* (2 vols., Berlin, 1888).

MARTENSITE. See IRON; METALLOGRAPHY.

MAR'THA, Ger. pron. mār'tā. An opera by Flotow (q.v.), first produced in Vienna, Nov. 25, 1847; in the United States, Nov. 1, 1852 (New York).

MARTHA AND MARY, OF BETHANY. Two sisters named in the Gospels of Luke and John as special friends of Jesus. At their home in Bethany, on the Mount of Olives, near Jerusalem, Jesus found a welcome on his visits to Jerusalem. Martha, being represented as taking the lead, was perhaps the elder, though Mary was the more appreciative of Jesus' teaching (cf. Luke x. 38-42). The regard in which Jesus held the sisters was extended to their brother Lazarus (q.v.), at whose death Jesus came to Bethany to comfort the sisters, not only by the raising of the dead one, but by teaching concerning immortal life, which Martha, however, found hard to grasp (John xi.). A few days before the crucifixion Jesus was a guest at a meal in the home of Simon of Bethany, a leper, at which Martha assisted, and which Mary made the occasion of anointing Jesus with the contents of a box of most precious ointment—a symbol of her regard graciously accepted by Jesus (Matt. xxvi. 6-13; Mark xiv. 3-9; John xii. 1-8). The attempts to identify this anointing with that referred to in Luke vii. 36-50 cannot be pronounced successful. Nothing more is known of the sisters. Mediæval legend confounded Mary with Mary Magdalene (q.v.), and asserted that

she, Martha, and Lazarus labored and died in southern France.

MARTHAS VINEYARD. An island lying off the southern coast of Massachusetts, of which State it forms, with one or two minor islets, the County of Dukes (Map: Massachusetts, F 7). It is about 20 miles long and about 9½ miles in greatest width, and is separated from the mainland by Vineyard Sound, 4 to 6 miles wide. The island is mainly level excepting a ridge of hills along the northwestern coast, and some hilly country in the western part. The highest point is Prospect Peak, 308 feet, in Chilmark township. The south coast has shallow lagoons and sand bars, while on the north side the coast consists of bluffs about 30 feet high. Gay Head Light, at the western extremity, is 145 feet above the sea. The island is a much-frequented summer resort, and is noted for its large annual camp meetings which were begun in 1835 at Oak Bluffs, renamed Cottage City in 1907. The principal town and the county seat is Edgartown. The population in 1900 was 4561; in 1910, 4504. The island was discovered and named by Bartholomew Gosnold in 1602. Its Indian inhabitants were all converted to Christianity, and were loyal to the whites during King Philip's War. During the Revolution the island was plundered by the British.

MARTÍ, mār-tē', JOSÉ JULIÁN (1853-95). A Cuban patriot and author, born in Havana. At 16 he was condemned to imprisonment for his liberal ideas and in 1871 was banished to Spain, where he published his first pamphlet, entitled *El Presidio político en Cuba* (1871). He studied in the University of Saragossa and received degrees in law, and philosophy and letters (1873). Escaping from Spain, he went to Mexico (1873), where he edited the *Revista Universal*. In 1877 he went to Guatemala and there wrote plays, taught in the Normal School, and served as judge. After the Peace of Zanjon (1878), he returned to Cuba, but being implicated in the revolutionary movements of 1879, he was deported again to Spain. In 1880 he went to New York, visited Carácas, and returned to New York, where he accepted the position of Consul of Argentina. At this time he began the propaganda in favor of the separation of Cuba from Spain, which won him the title of the "Apostle of the Independence." A prolific writer and an able orator, he devoted his energies to arousing the Cuban émigrés to action. He visited Tampa and Key West in 1891 and the following year founded the *Partido Revolucionario Cubano*, which soon had branches in the Cuban colonies in the cities of the United States, Mexico, Santo Domingo, and Haiti. Martí was named *Delegado* of the Partido with extensive powers. He secured the adhesion of Máximo Gómez to the movement, and carried on the agitation, visiting many cities and making speeches in English and Spanish. Pursuant to his plans, the Cubans arose in revolt on Feb. 24, 1895, and on April 10 Martí and Máximo Gómez landed at Sabana la Mar, near Baracoa, to join the movement. Martí was named, at once, major general of the patriot forces. On May 19 the Cuban army was surprised at Dos Ríos by a Spanish column, and in the skirmish Martí was killed. He published in New York *La Patria*, a journal devoted to Cuban interests, and *La Edad de Oro*, a children's paper. He wrote a novel *Ismaelillo* and numerous poems, translated

Ramona, by Helen Hunt Jackson, and *Mystery*, by Hugh Conway, and corresponded for various newspapers. His writings have been collected and edited by his friend Gonzalo de Quesada, under the title *Obras literarias* (Washington, Havana, and Berlin, 1900-11). Consult: "José Martí: apuntes biográficos," in *Biblioteca del periódico Cuba* (Tampa, Fla., 1896); M. Deulofeu, *Martí, Cayo Hueso, y Tampa* (Cienfuegos, 1905); M. H. Ureña, "José Martí," in *Cuba Contemporánea*, vol. ii (Havana, 1913).

MARTI, mär'tè, KARL (1855-). A Swiss Old Testament scholar, born in Bubendorf, Basel. He studied at Basel under Kautzsch and Socin, at Göttingen under Ritschl, and at Leipzig under Fleischer and Delitzsch. From 1878 to 1895 he was pastor of Reformed churches in the Canton of Basel, and for most of this time taught in the University of Basel. He went to the University of Bern in 1895 as professor of Old Testament, and after 1901 also held the chair of Semitic philology. In 1912 he was rector of the university. His most important work was on the prophets, and his published works include: *Der Prophet Jeremia von Anatot* (1889); *Der Prophet Sacharja, etc.* (1892); *Der Einfluss der Ergebnisse der neuesten alt-testamentlichen Forschungen auf Religionsgeschichte und Glaubenslehre* (1894; also in a Swedish version); *Kurzgefasste Grammatik der biblisch-aramäischen Sprache* (1896; 2d ed., 1911); *Geschichte der israelitischen Religion* (1897; 5th ed., 1904); "Isaiah" (1900), "Daniel" (1901), and the "Dodekapropheten" (1903-04) in the *Kurzer Hand-Kommentar zum alten Testament*, of which he was editor from 1897 to 1904; *The Religion of the Old Testament* (1907; in German, 1906); *Stand und Aufgabe der alt-testamentlichen Wissenschaft in den Gegenwart* (1912).

MARTIAL, mär'shal (MARCUS VALERIUS MARTIALIS). The greatest Roman epigrammatist. He was born at Bilbilis, in Spain, March 1, 38-41 A.D.; the exact year is in doubt. In 64 he came to Rome, where he resided till 98, when he returned to his native town. Here he found many good friends and patrons, and a highly cultivated lady named Marcella made him a present of a small estate, where he passed in repose the years until his death, which occurred not later than 104 A.D.. While at Rome Martial became famous as a wit and poet, and received the patronage of the emperors Titus and Domitian. He was on intimate terms with Juvenal (q.v.). He lived in a sort of precarious affluence in a mansion in the city, and in Nomentum, a suburban villa, to both of which he makes frequent reference. From Rome his reputation rapidly extended to the provinces; and even in Britain his *Epigrammata*, which, divided into 14 books, now form his extant works, were familiarly read. These books, which were arranged by himself for publication, were written in the following order: The first 11, including the *Liber de Spectaculis*, were composed at Rome, with the exception of the third, which was written during a tour in Gallia Togata (Cisalpine Gaul); the twelfth was written at Bilbilis, and the thirteenth and fourteenth at Rome, under Domitian. The last two, entitled *Xenia* and *Apophoreta*, describe in distichs the various kinds of souvenirs presented by the Romans to one another on holidays. To the other books we are also indebted for much of our knowledge of the manners and customs which

prevailed under the Empire from Nero to Trajan. Martial's works have also a great literary value, as embodying the best specimens of what we now understand by epigram (q.v.)—not a mere inscription, but a poem of two or more lines, containing the terms of an antithesis, which ends with a witty or ingenious turn of thought. The wonderful inventiveness and facility displayed by Martial in this species of composition have always received the highest admiration, qualified, however, by disgust caused by his grossness, and his servile flattery of Domitian. The best edition of Martial is that of Friedländer (2 vols., Leipzig, 1886); a handy text edition is that of Gilbert (Leipzig, 1886). The "Introduction" to E. Post's excellent edition of *Selected Epigrams of Martial* gives a good account of Martial's life and writings, of his character as a man, of his relations with his contemporaries, of his indebtedness to other writers, especially Catullus (q.v.), and of his fame. He has never found an adequate translator, but a collection of translations in prose and verse will be found in Bohn's "Classical Library." Consult also W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910); P. Nixon, *A Roman Wit: Epigrams of Martial Rendered into English* (Boston, 1911); and Martin Scanz, *Geschichte der römischen Litteratur*, vol. iii, pt. 2, §§ 413-415a (3d ed., Munich, 1913).

MARTIAL LAW (Lat. *martialis*, pertaining to war or Mars, from Mars, the god of war). The exercise of exceptional governing power by military authorities in cases where the ordinary law is superseded by the control of military forces. It is not a written law, but arises out of a necessity, either (a) in case of the invasion of a foreign country by belligerents, or (b) where by the force of internal dissension or conflict the regular civil authority of a country is partly or wholly overcome, and the proclamation of martial law is necessitated by the exigency of the occasion.

Martial law includes under its sway all persons—whether civil or military. In its administration the forms of military law are adhered to as far as practicable. In the Civil War the government of the United States declared martial law to be the immediate and direct effect and consequence of occupation or conquest, and that it was simply military authority exercised in accordance with the laws and usages of war. When a place, district, or country is occupied by an enemy, civil and criminal law continues to take its usual course unless stopped by order of the occupying military power; but the functions of the hostile government, legislative, executive, or administrative, cease, or continue only with the sanction or participation of the occupier. Under martial law cases which come within the "rules and articles of war," or the jurisdiction conferred by statute on courts-martial, are tried by the latter, otherwise by military commission. It was the judgment of the Supreme Court of the United States *ex parte Milligan* (4 Wall. 2, 127) that, when the civil courts are open and in "the unobstructed exercise of their jurisdiction," a military tribunal is without the necessary jurisdiction to try civilians. Martial law is not retrospective. An offender cannot be tried for an offense committed before martial law is proclaimed. Martial law may continue in a conquered country until a civil government can be established or restored. Acts done under martial law have no immediate con-

stitutional or legislative authorization, but emanate directly from the military power. But where the civil authority exists the Constitution is imperative (Art. VI, Sec. 2) that it shall be paramount. Under the constitutional system of the United States, it is held by the Supreme Court that a State Legislature may proclaim the existence of martial law when demanded by the public safety. The power of the Federal government to make such proclamation is a restricted one, implied from the clause in the Constitution (Art. I, Sec. 9, Sub. 2), providing that only in cases of rebellion or invasion, where necessary for the general welfare, shall the writ of *habeas corpus* be superseded. For further information as to the suspension of the privilege of *habeas corpus* in time of martial law, see *HABEAS CORPUS*. Compare *MILITARY LAW*, from which martial law must be distinguished.

MARTIANUS CAPELLA. See *CAPELLA*, MARTIANUS MINNEUS FELIX.

MARTIGNAC, mār'tē'nyāk', JEAN BAPTISTE SYLVÈRE GAY, VISCOUNT DE (1778-1832). A French politician and administrator, born at Bordeaux. His devotion to the Bourbons and his services to the Duchess d'Angoulême during the Hundred Days won him the post of Procurator-General of Limoges in 1815. Six years later he was elected a deputy, and made himself prominent by his eloquence and his gradual abandonment of his extreme Bourbon sentiments. He accompanied the expedition to Spain in 1823 and two years later was made Viscount. In 1828 he became Secretary of the Interior and actual head of the ministry. Here his policy was checked by a combination of the Right and the Left. He retired in August, 1829, and signed the address of the Two Hundred and Twenty-One; but after the revolution of July, 1830, boldly defended Charles X. He wrote an *Essai historique sur la révolution d'Espagne et sur l'intervention de 1823* (1832). Consult E. Daudet, *Le ministère de M. de Martignac* (Paris, 1875).

MARTIGNY, mār'tē'nyè', or **MARTINACH** (Lat. *Octodurum*). Three united villages in the Canton of Valais, Switzerland, situated 1550 feet above the sea on the left slope of the Rhone valley, about 24 miles south from the east end of Lake Geneva (Map: Switzerland, B 2). The two noted routes, one to the Vale of Chamoni by the Tête Noire or the Col de Balme, and another to the Great St. Bernard, branch off here. Martigny is on the Simplon road into Italy, and is a resort frequented by tourists. Pop., 1900, 4292; 1910, 5613.

MARTIN (from *Martin*, Fr. *Martin*, from ML. *Martinus*, Martin, from Lat. *Mars*, the god of war). A swallow; in the United States, one of the large purple swallows of the genus *Progne*. Several of the South American species are familiar birds in Argentina, one species (*Progne tapera*) breeding only in the clay structures of an ovenbird. The common purple martin (*Progne subis*) is widely distributed in North America, ranging in summer as far north as Newfoundland and the Saskatchewan, and wintering in Central and South America. The martin is eight inches long and sixteen across the wings. The male is shining blue-black, while the female is bluish-black above and brownish-gray beneath. The nest was primitively made in hollows of old trees, but in all settled parts of the country the birds now occupy bird houses set upon poles for their accommodation, and they have distributed themselves accordingly, not frequenting farms or

villages where bird houses are not erected for them. In occupying these houses they must withstand the competition of bluebirds, wrens, white-bellied swallows, and, most of all, English sparrows. The growing scarcity of the bird in New England is attributed mainly to the usurpations of the last-named species, which, having got possession of the quarters, cannot easily be dislodged. These various influences make the distribution of the species more and more local, and are lessening its numbers in the northeastern States. In the South they are more numerous and familiar, and they are everywhere regarded with affection. The eggs are pure white. The food and habits of the martin are like those of other swallows. See *SWALLOW*.

In Europe the black swift is sometimes called "black martin," and in France the name "martin" is applied to the kingfisher; but the French colonists in the Orient call the mynas of the genus *Acridotheres* "martins." In the United States the bank swallow (q.v.) is sometimes called "sand martin," and the kingbird is occasionally called "bee martin." Such uses of the word, however, are confusing, and it is desirable that the name martin should be confined at least to the swallows, and in America to those of the genus *Progne*. See *PLATE OF SWALLOWS*.

MARTIN. The name of five popes, the second and third of whom are more properly known as Marinus I and II, though since the thirteenth century the two names have commonly been confounded in the lists. **MARTIN I**, Saint, Pope 649-655. He was a martyr to his firm stand against monothelitism, which he caused to be condemned in the first Lateran Council. (See *LATERAN COUNCILS*.) In consequence he was seized by the Greek Emperor Constans II, who attempted to depose him and carried him off to the Crimea, where he died a prisoner. Consult *Cambridge Mediæval History*, vol. ii (Cambridge, 1913).—**MARTIN II**, Pope 882-884. Before his election to fill the vacancy caused by the violent death of John VIII, he had been Bishop of Cære, and chosen by three popes to represent them as legate in the delicate negotiations with the East, in which capacity he was present at the fourth Council of Constantinople in 869. As Pope he had close relations with the English King Alfred, to whom he sent a relic of the cross. Consult H. K. Mann, *Lives of the Popes*, vol. iii (London, 1906).—**MARTIN III**, Pope 942-946. A Roman by birth and a man of high repute for learning and piety, though his pontificate fell in the unhappy period of the domination of the Italian noble factions. Consult H. K. Mann, *Lives of the Popes*, vol. iv (London, 1910).—**MARTIN IV**, Pope 1281-85, Simon de Brion. A Frenchman by birth, he became canon of Tours, was made Cardinal by Urban IV in 1261, and was several times legate in France. He was elected Pope by the influence of the French party in the Sacred College, aided by the presence at Viterbo (where the conclave was held) of Charles of Anjou, whom he afterward constantly supported, especially in his efforts to retain possession of Sicily. Consult "Les Régistres de Martin IV," in *Bibliothèque des écoles français d'Athènes et la Rome* (Paris, 1901).—**MARTIN V**, Pope 1417-31, Otto Colonna. He was born in Rome in 1368. He was named Cardinal in 1405 by Innocent VII, and in 1410 appointed to adjudicate the appeal of Huss, against whom he decided. By his election to

the papacy at Constance the great schism (see CONSTANCE, COUNCIL OF; SCHISM, WESTERN) was finally extinguished. He presided in all the subsequent sessions of the council; and when the Fathers separated without discussing urgent questions of reform, he was finally persuaded to call another council, originally at Pavia, then, from fear of the plague, at Siena, and when it was about to meet at Basel, he designated the zealous reformer Cardinal Cesarini as its president. Martin himself, however, died just before the assembling of the council. Consult Mandell Creighton, *History of the Papacy*, vols. i, ii (London, 1902-04), and Ludvig Pastor, *History of the Popes*, vol. i (ib., 1906).

MARTIN, mär'tän', BIENVENU (1847-). A French Socialist leader and cabinet officer. He was born at Saint-Bris (Yonne), and was educated in the law. He held an underprefecture, entered the Council of State, and in 1894 became director under the Minister of Colonies. He was an unsuccessful senatorial candidate for Yonne in 1897; was elected deputy for Auxerre in that year; was reelected in 1898 and 1902; and in 1905 became Senator for Yonne. In the Chamber he supported the Waldeck-Rousseau and the Combes ministries, and advocated the separation of church and state. In 1904 he organized the new Radical Socialist group of the Left. In 1905-06 he held the portfolio of Public Instruction in the Rouvier cabinet; he was Minister of Justice in the Doumergue cabinet in 1913-14, and in the first Viviani cabinet organized in June, 1914; and when the War in Europe (q.v.) broke out in 1914, he became Minister of Labor in the second Viviani cabinet, formed August 26 of that year.

MARTIN, BRADLEY (1841-1913). An American banker, brother of Frederick Townsend Martin, born at Albany, N. Y. He was educated at Union University (A.M., 1863); served as lieutenant in the National Guard during the Civil War; and was admitted to the bar. He devoted his time to the management of his interests in banks, trust companies, and industrial corporations; but he took also a leading part in the social life of New York City. From 1893 until his death he lived in England and Scotland.

MARTIN, mär'tên, EDUARD (1809-75). A German gynecologist and obstetrician. He was born at Heidelberg; studied medicine there, at Jena, Göttingen, and Berlin; and became professor of gynecology at Jena (1837) and at Berlin (1858). Martin was one of the first to operate on diseased ovaries. He wrote: *Lehrbuch der Geburtshilfe für Hebammen* (4th ed., 1880); *Handatlas der Gynäkologie und Geburtshilfe* (1862; 2d ed., 1878); and *Die Neigungen und Bewegungen der Gebärmutter* (1866; 2d ed., 1870).

MARTIN, EDWARD SANDFORD (1856-). An American author and editorial writer, born at Owasco, N. Y., educated at Harvard (A.B., 1877), and admitted to the bar at Rochester, N. Y., in 1884. He was honored with membership in the National Institute of Arts and Letters. A contributor, editorially, to *Life*, and a writer for various periodicals, his work includes, also: *Sly Ballades in Harvard China* (1882); *A Little Brother of the Rich* (1890), verses; *Pirated Poems* (1890); *Cousin Anthony and I* (1895); *Lucid Intervals* (1900); *The Luxury of Children, and other Luxuries* (1904); *The Courtship of a Careful Man* (1905); *Reflections of a Begin-*

ning Husband (1913); *The Unrest of Women* (1913); *The War Week by Week*, being observations from *Life* (1914); *Poems* (1915).

MARTIN, ERNST (1841-1910). A German scholar in Romance and Germanic philology. He was born at Jena, a son of Eduard Martin; studied at Jena, Berlin, and Bonn, and was made professor at Strassburg in 1877, after having taught in the universities of Freiburg and Prague. He wrote a useful *Mittelhochdeutsche Grammatik* (1865; 13th ed., 1906); *Examen critique des manuscrits du roman de Renard* (1872), followed by two editions of *Reynaert* (1874), and *Roman de Renart* (1882-87), as well as the *Neue Fragmente der Gedichte von den Vos Reinaerde* (1889); *Geschichte der niederländischen Litteratur* (1870-72); *Untersuchungen zur Gralsage* (1880); *Elsässische Litteraturdenkmäler des 14ten bis 17ten Jahrhunderts* (5 vols., 1878-87); *Wörterbuch der elsässischen Mundarten* (1899); an edition of *Parcival und Titurel* (2 vols., 1900-03); an edition of *Kudrun* (2 vols., 1902); *Wolfram von Eschenbach* (1903); and *Der Versbau des Heliand und der altsächsischen Genesis* (1907).

MARTIN, mär'tän', FÉLIX (1804-86). A French-Canadian Jesuit and author, born at Auray in Brittany. In 1842 he was sent to Canada to assist in reestablishing Jesuit missions there. He founded St. Mary's College in Montreal; collected material for the history of Canada, and published and edited many works throwing light on the old Canadian Jesuit missions, among which are the following: *Manuel du pèlerin de Notre Dame de Bon Secours* (Montreal, 1848); *Relation des Jesuites* (1850), an enlarged edition of O'Callaghan's work; *Mission du Canada, relations inédites* (1861); *De Montcalm en Canada* (1867); and *Le R. P. Isaac Jogues* (1873). He assisted Carayon in a series of volumes on the Jesuit missions.

MARTIN, FRANÇOIS XAVIER (c.1762-1846). An American jurist and historian. He was born in Marseilles, France, and when about eighteen years of age engaged in business at St. Pierre, Martinique, then, as now, a dependency of France. In 1783 he came to the United States and settled in Newbern, N. C. Under the patronage of ex-Governor Abner Nash he began the study of law. In 1792, by request of the General Assembly, he compiled the British statutes which were in force in North Carolina at the time of the Revolution. In 1794 he made a compilation of the private acts of the Assembly, and in 1803 extended Judge Iredell's revision from 1789. Meanwhile he had translated and published Pothier on *Obligations*. In 1806-07 he represented the borough of Newbern in the State Assembly. In 1809 President Madison appointed him judge of the Territory of Mississippi, and the next year he was transferred to the Territory of Orleans. When the State of Louisiana was admitted to the Union in 1813, he became the first Attorney-General. In 1815 he was appointed to the Supreme Court and served thirty-one years. During the latter part of this time he was presiding judge. At the time of his appointment the law in force in the State was a mixture of Spanish and French statutes and decisions, into which the writ of *habeas corpus* and the system of procedure in criminal cases according to the common law had been introduced. Judge Martin's services in welding into a homogeneous whole this mass of contradictory statutes and principles gave him

the title "Father of the jurisprudence of Louisiana." During the last ten years of his life he was practically blind, but continued to do full work on the bench until superseded by the judges appointed under the new Constitution in 1845. In addition to his judicial labors, he published two volumes of *Reports of the Superior Courts of Orleans*, from 1809 to 1812 (1811 and 1813); eighteen volumes of *Reports of the Supreme Court of Louisiana* (1813-30); a *History of Louisiana* (1827); and a *History of North Carolina* (1829).

MARTIN, FREDRIK ROBERT (1868-). A Swedish art collector and author, born in Stockholm. He was amanuensis in the State Historical Museum (1899-1902) and interpreter at the Swedish Legation in Constantinople (1903-08); gained the doctorate in Vienna (1899); and is best known for his rich collections of Oriental art, made on journeys to Siberia (1891-92), Russia, Caucasus, and Central Asia (1894-95), and to Egypt, Asia Minor, and Turkey (1895-96). In 1898-1903 the government sent him to Russia, Turkey, and other lands to locate objects of art which had been produced in Sweden. He exhibited collections at the Stockholm Exposition (1897) and at the Mohammedan Exposition at Munich (1910), where he was a commissioner. Among other works he published: *The Persian Lustre Vase in the Imperial Hermitage at St. Petersburg* (1899); *Figuren Persische Stoffe, 1550-1650* (1899); *Svenska kungliga gåvor till ryske zaren, 1647-1699* (1900); *Silfverskatter i kejserliga skatkammaren i Moskva* (1900); *Dänische Silberschätze aus der Zeit Christian IV. im kaiserlichen Schatzkammer, Moskva* (1900); *Die Persischen Prachtstoffe im Schlosse Rosenborg, Kopenhagen* (1901); *Ältere Kupferarbeiten aus dem Orient* (1902); *A History of Oriental Carpets Before 1800* (1908), a great work; and *The Miniature Painting and Painters of Persia, India, and Turkey, 8th to 18th Century* (1912).

MARTIN, FREDERICK TOWNSEND (1849-1914). An American author, brother of Bradley Martin, born at Albany, N. Y. He graduated from the Albany Law School in 1872, and became judge advocate with the rank of colonel in the National Guard. The latter years of his life were spent chiefly in Europe, and he died in London, where he had become known for his philanthropies. His writings on the subject of the life of the wealthy and the socially prominent owe their value to Martin's personal experiences. Besides contributing to magazines, he wrote: *The Passing of the Idle Rich* (1911); *My Personal Experiences of Meeting Snobs* (1911); *The Reminiscences of My Life* (1911); *Things I Remember* (1913).

MARTIN, GEORGE MADDEN (Mrs. ATTWOOD R. MARTIN) (1866-). An American writer of stories, born in Louisville, Ky., and educated in the public schools in that city, and at home. A successful contributor of short stories to magazines, she succeeded also in winning a large audience with her books: *Emmy Lou—Her Book and Heart* (1902); *House of Fulfilment* (1902); *Abbie Ann* (1907); *Letitia, Nursery Corps, U. S. A.* (1907); *Selina, her Hopeful Efforts and her Livelier Failures* (1914).

MARTIN, GREGORY (?-1582). A translator of the Bible, born at Maxfield in Sussex, England. He was educated at St. John's College, Oxford (B.A., 1561; M.A., 1565), where he was distinguished as a Hebraist and Grecian. After

leaving the university, he became tutor to Philip Howard, afterward Earl of Arundel. A staunch Catholic, he encouraged the Howards to remain true to their faith. Unable to conform to the Established church, he fled to Douai in Flanders (1570), where he taught Hebrew in the English College, then just established. In 1577 he was sent to help organize the English College at Rome. In 1578 the college at Douai was moved to Rheims. There Martin spent the rest of his life in the translation of the Bible. He died October 28, 1582. The famous Douai Bible, though since revised, is still the standard among English Catholics. It was made from the Latin, collated with the Greek and the Hebrew versions. The New Testament appeared at Rheims in 1582. The Old Testament was not published till 1609-10. The whole was revised by Bishop Challoner in 1749-50. Though Martin's version was severely criticized by English Protestants, it was freely used for the authorized Protestant version made under King James.

MARTIN, HELEN REIMENSNYDER (1868-). An American author. She was born at Lancaster, Pa.; studied at Swarthmore and Radcliffe colleges; and married Frederic C. Martin in 1889. She became known for her stories of "the Pennsylvania Dutch," the shorter ones contributed to *Leslie's*, the *Century*, the *Cosmopolitan*, the *Ladies' Home Journal*, and other magazines. Her early work was so photographic in character that it was much resented by the people among whom she had lived. She is author of *Warren Hyde* (1897); *The Elusive Hildegard* (1900); *Tillie, A Mennonite Maid* (1904); *Sabina, A Story of the Amish* (1905); *His Courtship* (1907); *The Betrothal of Elypholate* (1907); *The Revolt of Anne Royle* (1908); *The Crossways* (1910; new ed., 1914); *When Half-Gods Go* (1911); *The Fighting Doctor* (1912); *The Parasite* (1913); *Barnabette* (1914); *Martha of the Mennonite Country* (1915).

MARTIN, mär'tän', HENRI (1810-83). A French historian, born at Saint Quentin. Educated for the practice of law, he soon abandoned law for literature. At first he wrote historical romances and poetry, but later, with Paul Lacroix, he began the task of compiling a history of France, to be made up of extracts from different authors. One volume only was published, when Lacroix abandoned it, but Martin resolved to go on. The first volume appeared in 1833, and the undertaking was completed in 1836. Meanwhile he set to work on a history of his own, the first edition of which appeared in the years 1833-36, in fifteen volumes. The third and enlarged edition appeared between 1837 and 1854, in nineteen volumes. In 1844 the Academy of Inscriptions gave Martin a prize of 9000 francs; in 1851 he received the Gobert prize, and in 1869 was awarded the great prize of 20,000 francs by the Institute. After the fall of the Second Empire he was elected to the National Assembly, and in 1876 he was elected Senator. In 1878 he became a member of the French Academy. As an historian Martin belongs to the school of Thierry. His *Histoire de France*, which comes down to the year 1789, was later continued into the nineteenth century by the *Histoire de France moderne* (2d ed., Paris, 1878-85). He was the author of numerous other literary and historical works, but his great fame rests on the *Histoire de France*. Consult: Hano-taux, *Henri Martin* (Paris, 1885); Mulot, *Souve-*

nirs intimes (ib., 1885); Jules Simon, Mignet, Michelet, Henri Martin (ib., 1889).

MARTIN, HENRI JEAN GUILLAUME (1860-). A French decorative painter. He was born at Toulouse and studied under Jean Paul Laurens. He became Officer of the Legion of Honor, was awarded a "first medal" in 1883, a gold medal at the Exposition of 1889, and a grand prize at the 1900 Exposition. His works comprise: "Beauty" (1900); "Pastoral" and "The Painter" (1901); "The Painter's Muse," "The Green Country Seat" (both 1902); "The Landscape" (1903); "Labor," "The Float," "Noon," "Evening," decorative panels (1904); "Landscape," decorative panel for Rostand's house (1904). In 1903 and 1906 he painted decorations for the Capitol of Toulouse; and in 1907 "Twilight" and "Rural Scenery."

MARTIN, HENRY AUSTIN (1824-84). An American surgeon, born in London, England, and educated at the Harvard Medical School, where he graduated in 1845. During the Civil War he served as surgeon in the Union army, became surgeon in chief of the Second Corps, Army of the Potomac, and was later brevetted lieutenant colonel and medical director. In his practice in Boston, after the war, he made himself well known by introducing the Beaugency virus (1870), the use of the rubber bandage (1877), and tracheotomy without tubes (1878). Dr. Martin contributed largely to medical journals (especially the London *Lancet* and the *British Medical Journal*), and also to the *North American Review*.

MARTIN, mār'tān', HENRY MARIE RADEGONDE (1852-). A French paleographer and librarian, born at Airvault (Deux-Sèvres). He became administrator of the Arsenal Library, was for a time secretary general of the international congress of librarians, and took an active part in numerous other societies. He wrote: *Le livre du roi Dancus* (1883), written under the nom de plume of Henry Martin-Dairvault; *Catalogue général des manuscrits de la bibliothèque de l'arsenal* (8 vols., 1885-1900); *L'Odyssée d'un bibliographe* (1892); *L'Evangélique de Sainte-Aure* (1897); *Histoire de la bibliothèque de l'arsenal* (1900), crowned by the Institute; *Procès-verbaux et mémoires du congrès international des bibliothécaires* (1901); *Observations sur la technique de l'illustration de livres du moyen âge* (1904); *Les miniaturistes français* (1906); *Le Ténacité des ducs* (1907); *La légende de Saint-Denis* (1909); *Les joyaux de l'arsenal* (1909); *Les peintres de manuscrits et la miniature en France* (1909); *Le Boccace de Jean sans Peur* (1911). He reëdited in 1888 Louys Gruau's *Nouvelle invention de chasse pour prendre et oster les loups de France* (published 1613).

MARTIN, HENRY NEWELL (1848-96). An American biologist, born in Newry, Ireland. He was educated at University College, London, and at Christ's College, Cambridge, where he graduated B.A. in 1874 and became fellow. In 1876 he was chosen professor of biology at Johns Hopkins and director of the biological laboratory. Martin there carried out some valuable experiments on respiration in general and especially on the beating of the heart of a mammal after death. In 1890 he was elected president of the American Society of Naturalists. He edited *Studies from the Biological Laboratory of Johns Hopkins* and the *Journal of Physiology*; assisted Huxley in his *Practical Biology* (1876) and

Moale in a *Handbook of Vertebrate Dissection* (1881-84); and wrote, apart from the papers above mentioned on respiration, *The Human Body* (1881) and *Observations in Regard to the Supposed Suction-Pump Action of the Mammalian Heart* (1887).

MARTIN, HOMER D(ODGE) (1836-97). An American landscape painter. He was born at Albany, N. Y., October 28, 1836, and, except that he studied there for a few weeks under William Hart (q.v.), a landscape painter of the Hudson River School, he was practically self-taught. In 1857 he first exhibited at the National Academy, and five years later he removed to New York. In 1875 he was elected a member of the National Academy, and in 1877 he was one of the founders of the Society of American Artists. After visiting Europe in 1876, he returned in 1881, and spent five years in France, at Villerville and Honfleur. Abroad he came under the influence of Boudin and Corot. On his return to America he resided in New York, until in 1893 he went to St. Paul, Minn., where he died February 12, 1897. His interpretation of nature is always poetical; his work was at first careful in detail, but later it became far bolder in style. Sure and powerful in line, it shows a keen comprehension of form, based upon careful studies from nature. His color is subdued, often expressed in tones of mellow browns, with subtle qualities of reflected light and shade. His brush work is firm and broad, and his paintings express large spaces, both in sky and land, and are always imbued with grave melancholy. Among his best-known works are: "The Old Mill" (1860); "Old Manor House," "Adirondack Scenery" (Untermeyer collection, New York); "The Iron Mine," "Evening on the Seine," and "Lower Ausable Pond," all three in the Evans collection, National Gallery, Washington; "Newport Neck" (Lotos Club, New York); "Sea at Villerville" (Kansas City Art Institute); "View on the Seine" (called by the painter "Harp of the Winds"), "Sand Dunes, Lake Ontario," and "Mounts Madison and Jefferson," all three in the Metropolitan Museum, New York; and "Lighthouse at Honfleur" and "Lake Sandford," both in the Century Club, New York. Consult: E. G. Martin, *Homer Martin, a Reminiscence* (New York, 1904); Samuel Isham, *History of American Painting* (ib., 1905); F. J. Mather, *Homer Martin, Poet in Landscape* (ib., 1912); F. F. Sherman, "Landscape of Homer Dodge Martin," in *Art in America*, vol. iii (ib., 1915); and for reproductions, D. H. Carroll, *Fifty-Eight Paintings by Homer D. Martin* (ib., 1913).

MARTIN, JOHN (1789-1854). An English historical and landscape painter, born at Haydon, near Hexham. The only art instruction that he received was from a china painter at Newcastle. In 1806 he moved to London, at first practicing china painting. He exhibited his first picture, "Sadak in Search of the Waters of Oblivion," at the Royal Academy, in 1812; "Adam's First Sight of Eve" (1813), and "Clytie" (1814). In 1817 "Joshua Commanding the Sun to Stand Still" gained for him a premium of £100 at the British Institute. His best-known work, "Belshazzar's Feast," appeared in 1821, and won a premium of £200. Then followed the "Destruction of Herculaneum" (1822); "Seventh Plague" (1823); the "Creation" (1824); "Fall of Nineveh" (1828); "Eve of the Deluge" (1840); and many other biblical

subjects, besides a number of landscapes in water color, six of which are in the South Kensington Museum. He died in the Isle of Man, Feb. 17, 1854. Martin was much criticized for his deficiencies in drawing and color, but he had a fertile invention and pronounced originality. His best work is his illustrations to Milton.

MARTIN, JOSEPH (1852-). A Canadian statesman. He was born at Milton, Ontario, was educated at the Michigan State and Ontario normal schools and Toronto University, and was a public-school teacher for some years. He removed to Manitoba, and was admitted to the bar of that province in 1882, practicing his profession successively in Portage la Prairie and Winnipeg. He was elected a Liberal member of the Manitoba Legislature in 1883, was Attorney-General in the administration of Thomas Greenway (q.v.) in 1888-91, and in 1890 introduced the famous measure abolishing separate schools (see MANITOBA). He was an unsuccessful candidate for the House of Commons in 1891, but in 1893-96 represented Winnipeg in that body. In 1897 he removed to Vancouver, British Columbia, was admitted to the bar of that province, sat in the Provincial Legislature (1898-1903), was Attorney-General and Minister of Education (1898-99), Premier and Attorney-General (1900), and leader of the Liberal Opposition (1902-03). He owned and edited the *Vancouver Guardian* in 1907. While in British Columbia he was prominently identified with the Asiatic Exclusion League, in 1908 was an unsuccessful candidate for the House of Commons in its interest, and the same year removed to England to practice his profession in London and enter British politics. He was elected to the British House of Commons in 1910.

MARTIN, JOSIAH (1737-86). An English Colonial Governor, born probably in the West Indies. He entered the British army in 1756, was promoted to be major in 1761, and lieutenant colonel in 1771. In the latter year he was appointed Governor of North Carolina to succeed William Tryon, who was transferred to New York. At first his frankness and honesty favorably impressed the people, but his stubbornness and his high opinion of the royal prerogative and of his own importance soon caused opposition. He attempted to prevent the Colony from sending delegates to the Continental Congress of 1774, but a Provincial Congress met and elected delegates in defiance of his protest. This seems to have been the first legislative body in America to meet without royal authority. After the battle of Lexington he was practically a prisoner in the palace at Newbern. Martin fled to Wilmington and then to Fort Johnston, on the Cape Fear River. On July 18, 1775, he took refuge in the British sloop-of-war *Cruiser* and attempted to administer the government from there until the next year. He was attacked by a small force of colonists, fled on board the *Cruiser*, and eventually was compelled to accompany the British fleet to Charleston in 1776. When Lord Cornwallis entered North Carolina at the head of a British force Martin was with him, and finally accompanied him to New York and from there to London, England.

MARTIN, mār'tên, KARL (1851-). A German geologist, born in Oldenburg. He studied at Munich, Leipzig, and Göttingen, where, in 1874, he became assistant in the geological museum; and after a year's teaching at Wismar in Mecklenburg was chosen professor of

geology at Leyden. In 1878 he was appointed director of the geological museum of Leyden; and in 1882 became a member of the Philadelphia Academy of Natural Sciences. In 1895-96 he was rector of the University of Leyden. He wrote, besides contributions to periodicals on the geology of the Netherlands and of the East Indies: *Niederländische und nordwestdeutsche Sedimentärgeschichte* (1878); *Tertiärschichten auf Java* (1879-80); *Bericht über eine Reise nach Niederländisch Westindien* (1888); *Reisen in den Molukken, in Amboin, den Uliassern, Seran und Buru* (1894; 2d ed., 1913); with Becker, *Geology of the Philippine Islands* (1901); *Geologischer Teil* (1903); *Vorläufiger Bericht über geologische Forschungen an Java* (1911-12).

MARTIN, KONRAD (1812-79). A German Catholic theologian, Bishop of Paderborn. He was born at Geismar; studied oriental languages at Halle and theology at Munich and Würzburg; took orders in 1836; and taught in Cologne and Bonn (1844). He was appointed to the see of Paderborn in 1856, and showed great diligence in advancing Catholic educational and charitable institutions. Called to Rome in 1869, he was a member of the Vatican Council of 1870, urged the dogma of infallibility, and publicly defended it. His opposition to the government at the beginning of the *Kulturkampf* (q.v.) was so violent that he was imprisoned for a year, and in 1875 fled to Belgium, where he died. He wrote various Catholic manuals: *Drei Gewissensfragen über die Maigesetze* (1874), anonymously; *Drei Jahre aus meinem Leben* (1877; 3d ed., 1878); and *Blicke ins Jenseits* (1878). Consult Christian Stamm, *Conrad Martin, Bischof von Paderborn* (Paderborn, 1892).

MARTIN, LADY. See FAUCIT, HELEN.

MARTIN, mār'tân', LOUIS ARMÉ (1786-1847). A French writer, born near Lyons. Educated for a mercantile career, he went, against the wishes of his parents, to Paris, where he took up literature. In 1815 he was appointed secretary of the Chamber of Deputies, and not long afterward became professor of literature and ethics in the Ecole Polytechnique. In 1831 he became keeper of the Library of St. Geneviève. He published *Etrennes à la jeunesse* (1809), and *Lettres à Sophie sur la physique, la chimie, et l'histoire naturelle* (1810), in prose and verse. His most valuable work was *Education des familles* (1834), contending that to improve mankind women must be educated so that they may be able to rear men of virtue. He was the disciple and friend of Bernardin de Saint-Pierre.

MARTÍN, mār-tên', LUIS (1846-1906). A Spanish Jesuit, twenty-fourth general of the order. He was born in Melgar, near Burgos, entered the Society of Jesus when 18, continued his studies, held the chair in rhetoric in Poynanne, France, and in 1877 became rector of the University of Salamanca, where he made a national reputation as a theologian. In 1891, he became assistant of the order in Spain, and in 1892, after the death of Anderledy, and on his recommendation, Martín was chosen general, removing to the official headquarters at Fiesole. His successor was Father Franz Xaver Wernz (q.v.).

MARTIN, LUTHER (1744-1826). An American lawyer and political leader, born in New Brunswick, N. J. He graduated at Princeton in 1766; taught school in Queenstown, Md.; studied law; was admitted to the bar in 1771; and prac-

ticed in both Maryland and Virginia. In 1774 he was a member of the Annapolis convention that protested against the arbitrary acts of the British crown, and throughout the Revolution he continued active on the Patriot side. In 1778 he was appointed Attorney-General of Maryland. He was one of Maryland's representatives in the Continental Congress in 1784-85. He was a delegate to the Constitutional Convention of 1787 at Philadelphia; steadfastly contended there against the establishment of a strong national government; finally left the convention altogether; and subsequently strongly opposed the ratification of the Constitution by Maryland. By his opposition to the Constitution he earned the sobriquet of "The Federal Bulldog." In 1804 he defended Judge Samuel Chase (q.v.) in the impeachment proceedings before the United States Senate, and in 1807 was counsel for Aaron Burr (q.v.). From 1814 to 1816 he was Chief Justice of the Court of Oyer and Terminer in Baltimore, and in 1818 was again made Attorney-General. He was stricken with paralysis in 1820, and, largely owing to poverty, lived thereafter at the home of his friend Aaron Burr in New York. He published *A Defence of Captain Cresap; Genuine Information Delivered to the Legislature of the State of Maryland Relative to the Proceedings of the General Convention Lately Held at Philadelphia* (1788); and *Modern Gratitude* (1801-02). Consult H. P. Goddard, *Luther Martin, the Federal Bull-Dog* (Baltimore, 1887).

MARTIN, PERCY F. (1861-). An English journalist and traveler. He was educated at University College, London, and early became a newspaper correspondent in Latin America and for a short time in India. Besides contributions to newspapers, reviews, and annuals on South and Central America, he wrote: *Through Five Republics of South America* (1905), *Mexico's Treasure House* (1906), *Mexico of the Twentieth Century* (1907), *Salvador of the Twentieth Century* (1911), *Peru of the Twentieth Century* (1911), *Maximilian in Mexico* (1913), *The Sudan in Evolution* (1914).

MARTIN, RICCARDO (1878-). An American operatic tenor, born at Hopkinsville, Ky. As a child he began to play the violin. In 1893 he went abroad, studying piano in Germany and singing in Italy. After a few years he returned and entered Columbia University, where he devoted himself to composition and orchestration under MacDowell. At that time he wrote a number of songs and choruses. In 1900 he settled in New York as a teacher of singing. Here Dr. Holbrook Curtis discovered his voice, whereupon he went to Florence to study with Lombardi. Having finished his vocal studies with Sbriglia and Escalais in Paris, he made his operatic debut in Nantes as Faust, in 1904. The next two years he sang in Verona and Milan, where he was engaged for the San Carlo Opera Company, with which he made his American debut at New Orleans in 1906. After 1907 he was a member of the Metropolitan Opera House, singing the principal lyric rôles; in 1915, after Caruso left for Monte Carlo, Martin was his temporary successor. He also sang at Covent Garden and in Mexico.

MARTIN, ROBERT MONTGOMERY (c.1803-68). An English historical writer and statistician, born in Ireland. In 1820-30 he traveled in Ceylon, Africa, and India, and in 1834 published his valuable *History of the British Colonies*.

He prepared for the press the papers of the Duke of Wellington, and in 1840 founded the *Colonial Magazine*, which for two years he edited. His further works include: *Political, Commercial, and Financial Condition of the Anglo-Eastern Empire* (1832); *History of the Antiquities of Eastern India* (1838); and *The Statistics of the British Colonies* (1839).

MARTIN, SIR THEODORE (1816-1909). An English author. He was born in Edinburgh, and was educated at the high school and university of that city. In 1846 he became parliamentary agent in London. Among his earliest literary ventures was the volume of parodies, *Bon Gaultier's Ballads* (1845; 16th ed., 1903), written in collaboration with Prof. W. E. Aytoun. In 1858 he began his series of admirable translations with *Poems and Ballads of Goethe* (again assisted by Professor Aytoun). *Faust* appeared in 1865-66. Martin's other versions are dramas from Oehlenschläger (1854-57), the *Odes of Horace* (1860), *Catullus* (1861), the *Vita Nuova* (1862), *Faust* (1865-86), Heine's *Poems and Ballads* (1878), and *Six Books of Vergil's Æneid* (1896). The Horace renderings, in 1882 extended to include the entire works, are generally conceded to be the best yet made of that poet. They are supplemented by a booklet in the *Ancient Classics for English Readers*. His further works include: *The Life of W. E. Aytoun* (1867); *The Life of the Prince Consort* (1874-80); *The Life of Lord Lyndhurst* (2d ed., 1883); a *Life* (5 vols., 1875-80) of the Prince Consort, for Queen Victoria; *Helena Faucit, Lady Martin* (1901); *Queen Victoria as I Knew Her* (1908); and *Madonna Pia* and other plays. In 1881 Martin was elected rector of St. Andrews University. He was knighted in 1880. For Lady Martin, see the article FAUCIT, HELEN.

MARTIN, THOMAS COMMERFORD (1856-). An American electrical engineer and editor, born in London, England. He was associated with Thomas A. Edison in his work in 1877-79 and thereafter was engaged in editorial work. From 1883 to 1909 he served as editor of the *Electrical World*, after 1909 was executive secretary of the National Electric Light Association, and in 1900-11 was a special agent of the United States Census Office. At various times he lectured at the Royal Institution of Engineers, London, the Paris Société Internationale des Electriciens, the University of Nebraska, and Columbia. In 1887-88 he served as president of the American Institute of Electrical Engineers. He is author of *The Electric Motor and its Applications* (1887; 3d ed., 1888), with Joseph Wetzler; *Inventions, Researches, and Writings of Nikola Tesla* (1893; 3d ed., 1894); *Edison: His Life and Inventions* (1910), with F. L. Dyer.

MARTIN, THOMAS MOWER (1838-). A Canadian landscape painter, born in London and a student there at the South Kensington Art School. He went to Canada in 1862 and settled at Toronto. He was influential in founding the Royal Canadian Academy, the Ontario Art Union, the Ontario Society of Artists, and the Ontario School of Art, of which he became director in 1877. His pictures include: "The Untamed Wilderness," "A Summer Idyl," and "Sunrise, Muskoka." He painted many pictures of Rocky Mountain and British Columbia scenery. He published *An Artist's Letters from the Rockies* (1889) and *Canada from an Artist's Point of View* (1893-95).

MARTIN, THOMAS STAPLES (1847-1919).

An American legislator. He was born at Scottsville, Va., and thenceforth lived on a farm two miles from that town. He was a cadet in the Virginia Military Institute in 1864-65 and during much of that time was in actual service in the Confederate army. He studied at the University of Virginia in 1865-67 and was admitted to the bar in 1869. In 1895 he became a United States Senator and was reelected for the third time for the term ending in 1919.

MARTIN, VICTORIA CLAFLIN WOODHULL (1838-). An American reformer, born in Homer, Ohio, a sister of Tennessee Claflin, who became Lady Cook. Victoria Claflin married, when she was 14, Dr. Canning Woodhull; the marriage was unhappy and there was a separation. In 1866 she married Col. James H. Blood; they were divorced in 1875. In 1870 Mrs. Woodhull, as she was called, with her sister formed in New York a stockbrokers' house called Woodhull, Claflin & Co., which published for several years *Woodhull & Claflin's Weekly*. In the same year she memorialized Congress in behalf of woman suffrage. In 1871 Miss Claflin was nominated for Congress and both sisters tried to vote in New York. Both had been mediums and clairvoyants and Mrs. Woodhull in this year was elected president of the National Association of Spiritualists. In May, 1872, she was nominated for the presidency of the United States by the Equal Rights party. In December of that year both sisters were arrested by the Federal authorities, charged with mailing improper matter, viz., the Beecher-Tilton scandal, published in their weekly (possibly without their knowledge). They were acquitted in June, 1873. Mrs. Woodhull lectured widely in the United States, especially on "The Human Body the Temple of God," and urged race improvement, the same standard of morality for both sexes, electoral reform, etc. In 1877 she went to England to live and there married John Biddulph Martin (died 1895), a London banker. She became editor of the *Humanitarian Magazine* and wrote on social subjects.

MARTIN, VIOLET ("Martin Ross") (?-1915). An Irish novelist, educated at home, at Ross, County Galway, and at Alexandra College, Dublin. She identified herself prominently with the woman suffrage movement. Her literary work began with a miscellany of articles contributed to various British periodicals. Eventually she collaborated with her cousin, Miss Edith C.E. Somerville, in a series of Irish novels. *The Experiences of an Irish R. M.* (1899), a tale racy of the soil and with a sparkle, dash, and wit that recall Charles Lever's rollicking stories, made a decided hit on both sides of the sea. Other novels in which she and Miss Somerville collaborated are: *The Real Charlotte* (1901); *The Silver Fox* (1902); *All on the Irish Shore* (1903); *Some Irish Yesterdays* (1906); *Further Experiences of an Irish R. M.* (1908); *An Irish Cousin* (1910); *Dan Russell the Fox* (1912); *In Mr. Knox's Country* (1913).

MARTIN, WILLIAM ALEXANDER PARSONS (1827-1916). An American missionary and educator, born at Livonia, Ind. He graduated at Indiana University in 1846 and entered the Presbyterian Seminary at New Albany, Ind. (now McCormick, Chicago); taught classics for a year; and then went to Ningpo, China, as missionary (1850). He founded the Presbyterian mission at Peking (1863) and remained in charge for five years, until he was appointed pro-

fessor of international law at the Tung-wên College of Peking, of which he was also president from 1869 to 1894. For the Chinese government he translated a number of works on international law, such as the *Guide diplomatique* (1874) and two textbooks on physics, which were especially reprinted for the Emperor. In 1880 he was sent abroad by the Chinese government to investigate the educational systems in other countries. He received the honorable title of mandarin of the third rank in 1885 and of the second rank in 1898; and in 1885 was also made the first president of the Oriental Society of Peking. From 1898 to 1900 he was first president of the Imperial University of Peking. His writings include: *The Chinese: Their Education, Philosophy, and Letters* (1881); *Evidences of Christianity* (1855, in Chinese); *The Three Principles* (1856); *Religious Allegories* (1857); *A Cycle of Cathay, or China South and North* (1896; 2d ed., 1897); *The Lore of Cathay, or the Intellect of China* (1901; 2d ed., 1912); *The Siege in Peking* (1900); *Awakening of China* (1907).

MARTIN, SIR WILLIAM FANSHAWE, fourth BARONET (1801-95). A British naval officer. Entering the navy in 1813, 10 years later he was appointed commander of the sloop *Fly*, in which he gave such valuable service that he was thereafter known as "Fly" Martin. He was promoted to captain in 1824, commodore in 1849, rear admiral in 1853, vice admiral in 1858, and admiral in 1863. As commander in chief of the Mediterranean in 1860-63 he greatly improved the discipline of the fleet. From 1866 to 1869 he was commander in chief at Plymouth and in 1870 was retired. He succeeded to his baronetcy in 1863.

MARTIN, WINFRED ROBERT (1852-1915). An American Orientalist, Hispanist, and librarian, a son of William Alexander Parsons Martin. Born at Ningpo, China, he studied the humanities at Princeton University, where he received the degree of A.B. in 1872, and that of A.M. in 1875. Three years later he graduated from the law school of New York University. After a long period of study in Germany he took his Ph.D. at Tübingen in 1887. From 1888 to 1907 he was professor of Oriental languages and literatures at Trinity College (Hartford, Conn.) and from 1902 to 1907 gave instruction in Sanskrit in the mission courses of Hartford Theological Seminary. Dr. Martin's linguistic ability was very unusual, and this, coupled with his wide reading and extraordinary memory, marked him for the difficult post to which he was called in 1907, and which he held until his death—that of librarian of the Hispanic Society of America, of which he was also a member. In 1907 Trinity College gave him an honorary LL.D., and in 1911 the King of Spain made him a Knight of the Order of Isabella the Catholic.

MARTINACH, mār'tē-nāg. The name of three united villages in Switzerland. See MARTIGNY.

MARTINA FRANCA, mār-tē'nā frāp'kā. A city in the Province of Lecce, Italy, situated on a hill 17 miles north-northeast of Taranto (Map: Italy, F 4). It is a comparatively modern town, with manufactures of oil. Pop. (commune), 1901, 25,007; 1911, 24,786.

MARTIN CHUZ'ZLEWIT. A novel by Charles Dickens, which appeared in 20 monthly parts in 1843 and 1844.

MARTIN DE MOUSSY, mār'tān' de mō'sé',

JEAN ANTOINE VICTOR (1810-69). A French physician and traveler, born at Moussy-le-Vieux. He studied medicine in Paris, and practiced in the military hospitals. In 1841 he went to Montevideo, South America, and in the nine years' siege of that place (1843-52) was director of the medical service to the French and Italian forces. After the downfall of Rosas, the dictator of Argentina, in 1852, he was employed by the government of President Urquiza to prepare a geographical description of that republic. In the execution of this task he spent four years (1855-59) in constant travel. The results of his labors are embodied in his work in three volumes, entitled *Description géographique et statistique de la confédération argentine* (1860-64), which, with the atlas accompanying it, is of the highest authority, and *Mémoire historique sur la décadence et la ruine des missions des jésuites dans le basin de la Plata* (1865). He presented to the city of Montevideo a well-equipped meteorological observatory.

MARTINE, măr'tin, **JAMES EDGAR** (1850-). An American legislator. He was born in New York City and was educated in the public schools. He engaged in farming near Plainfield, N. J., and dealt extensively in real estate and building operations. He was a candidate for various offices in New Jersey; was a warm supporter of Woodrow Wilson during the latter's governorship; and became United States Senator from New Jersey for the term of 1911-17. He attracted attention in the United States by championing the cause of the working class; particularly the miners of West Virginia and Colorado.

MARTINEAU, măr'ti-nō, **HARRIET** (1802-76). An English writer, sister of James Martineau, born at Norwich, England, June 12, 1802; educated mostly at home. She early became a convert to Unitarianism. Miss Martineau began writing when a girl, contributing her first article in 1821 to the *Monthly Repository*, the Unitarian organ. In 1829 the house in which had been placed the small fortunes of the family failed and Miss Martineau turned to literature for support. Her health had been precarious from girlhood and it now frequently broke down. For rest she visited America (1834-35) and Venice (1839). By 1845 she had passed from Unitarianism to agnosticism. In 1845-46 she settled near Ambleside by the English Lakes, where she lived till her death, June 27, 1876. Miss Martineau published 36 distinct works, comprising tales, novels, and essays on history, politics, economics, and philosophy, and contributed extensively to periodicals. In the *Daily News* alone appeared more than 1600 articles. She gained her first success with *Illustrations of Political Economy* (1832-34), a series of tales with a purpose, and *Illustrations of Taxation* (1834), in which she sought to popularize current theories through fiction. Among her other works are: *Society in America* (1837); *Western Travel* (1838); *Deerbrook*, a readable novel (1839); *The Playfellow*, good children's stories (1841); *Life in the Sick Room* (1843), autobiographical; *Letters on Mesmerism* (1845); *Eastern Life, Past and Present* (1848), in which she avowed her religious opinions; *History of England during the Thirty Years' Peace* (1849), a weighty piece of writing; *Letters on the Laws of Man's Social Nature and Development* (1851), written in conjunction with H. G. Atkinson; *The Philosophy of Comte* (1853), a condensation of the

Philosophie positive; *Biographical Sketches* (1869). Though little of Miss Martineau's work has survived as a permanent literary possession, it was of great value to her generation. She was a popularizer of the advanced thinking of her day. Consult: *Autobiography, with Memorials* by M. W. Chapman (London, 1877); F. F. Miller, *Harriet Martineau* (Boston, 1890); J. F. Clarke, "Harriet Martineau," in his *Nineteenth Century Questions* (Boston, 1898).

MARTINEAU, JAMES (1805-1900). An English Unitarian divine, brother of the preceding. He was born at Norwich, April 21, 1805. He was educated for the ministry at Manchester College (Unitarian, then located at York) and was graduated in 1827. He spent one year teaching in Bristol and then, Oct. 26, 1828, he was ordained to the Presbyterian ministry in Dublin. He resigned his pastorate in Dublin because he objected to receiving state aid in the *regium donum*, though it would have increased his salary by £100. From Dublin he went to Liverpool, where he was settled over Paradise Street Chapel and eked out his income by taking pupils. Here he attracted considerable attention by engaging, along with J. H. Thom and Henry Giles, in a controversy against some clergymen of the Church of England on the subject of Unitarianism. Soon afterward Martineau was elected professor of mental and moral philosophy at Manchester New College and continued to lecture in the college when it was removed to London in 1853, though he also retained his pulpit in Liverpool for four years. In 1857 he took up his residence in London. The next year he added to his work the task of sharing the pulpit of Little Portland Street Chapel with J. J. Taylor, then principal of the college. Upon the death of Mr. Taylor in 1868 he became principal of the college and filled the chapel pulpit alone for four years, when the strain compelled him to give it up. He is the author of *The Rationale of Religious Inquiry* (1836); also *Unitarianism Defended* (in collaboration with Thom and Giles, 1839), the lectures delivered in the controversy referred to above; *Endeavors after the Christian Life* (2 vols., 1843-47); *Miscellanies* (1852); *Studies of Christianity* (1858); *Essays, Philosophical and Theological* (1866-67); *Religion as Affected by Modern Materialism* (1874); *Hours of Thought on Sacred Things* (1876-79); *Study of Spinoza* (1882); *Types of Ethical Theory* (1885); *Study of Religion* (1888); and *The Seat of Authority in Religion* (1890). He received honorary degrees from Harvard, Leyden, Edinburgh, Oxford, and Dublin. He died Jan. 11, 1900. In philosophy he was an intuitionist, maintaining that men have a power of conscience which, without aid from experience, can ascertain the higher of two conflicting motives. In theology he was, as already seen, a prominent Unitarian; but his greatest importance will probably remain in his ethical work.

Bibliography. J. H. Hertz, *The Ethical System of James Martineau* (New York, 1894); A. W. Jackson, *James Martineau: A Biography and Study* (Boston, 1900); Henry Sidgwick, *Lectures on the Ethics of Green, Spencer, and Martineau* (ib., 1902); James Drummond, *Life and Letters of James Martineau* (2 vols., New York, 1902); S. P. Cadman, "James Martineau," in *Charles Darwin and Other English Thinkers* (Boston, 1911).

MARTINELLA, măr'té-něl'lá (It., crane).

A famous bell which in the old days of Florence used to announce the approach or declaration of war. It is usually spoken of in connection with the *carroccio*, a famous car of large size, drawn by oxen, which accompanied the citizens to the field of battle. After war was declared the *martinella* rang, and when at last the army moved out the bell was placed on a car which followed the *carroccio*, and guided the troops by its sound.

MARTINELLI, mār'tē-nēllē, SEBASTIANO (1848-). An Italian Roman Catholic prelate. He was born near Lucca, in the seminary of which town he received his theological education. He entered the Augustinian Order in 1863, was ordained priest in 1871, and was elected prior general of the order in 1889 and again in 1895. On the recall to Rome of Cardinal Satolli, the first Apostolic Delegate to the United States, he was appointed to succeed him, and at the same time was raised to the episcopate as titular Archbishop of Ephesus (1896). His wise and statesmanlike conduct of many difficult questions brought him during his term as delegate was generally recognized. In 1902, having been made Cardinal in 1901, he was recalled.

MARTINET, mār'tē-nā', ACHILLE LOUIS (1806-77). A French engraver. He was born in Paris and was a pupil of the painter Heim and of Forster, the engraver. Many of his important plates were after the old masters, as Rembrandt's portrait by himself, Raphael's various Madonnas, and Murillo's "Nativity"; but he also engraved the works of more recent painters. Among them were "The Last Moments of Count Egmont," after Gallait; "Charles I Mocked by Cromwell's Soldiers"; and "Mary in the Desert," after Delaroche. His work is distinguished by great delicacy of line and perfect but somewhat rigid technique.

MARTINEZ, mār-tē'nēz. A city and the county seat of Contra Costa Co., Cal., 35 miles by rail northeast of San Francisco, on the Straits of Carquinez and Suisun Bay and on the Southern Pacific Railroad (Map: California, C 5). It is an important shipping point for grain, grapes, and pears, has copper-smelting works and oil refineries, and manufactures fertilizers, lumber, and acids, etc. The city contains the De La Salle Institute of Christian Brothers, a public library, park, and fine high school, courthouse, and city hall buildings. Pop., 1900, 1380; 1910, 2115.

MARTÍNEZ, mār-tē'nāth, ENRICO (c.1570-1632). A Mexican engineer, born, according to different biographers, either in Holland, Germany, or Spain. He probably received his engineering education in Spain, was appointed royal cosmographer, and went to Mexico in 1603 as an interpreter of the Inquisition. In 1607 he took charge of the construction of the canal which was to drain the valley of Mexico, a work which he completed in less than a year. This canal soon proved inadequate, however, and Martínez was eventually commissioned to deepen the cut, but died while the work was still under way. A monument to him was unveiled in Mexico City in 1883. He wrote: *Discurso sobre la magna conjunción de los planetas Júpiter y Saturno, acaecida en 24 Diciembre 1603 en Sagitario* (Mexico, 1604); *Repertorio de los tiempos, é historia natural de Nueva España* (Mexico, 1606), and a *Tratado de trigonometría*. He also designed 32 maps of the Pacific coast of Mexico.

MARTÍNEZ DE CAMPOS, mār-tē'nāth dā

kām'pōs, ARSENIO (1831-1900). A Spanish general and statesman, born at Segovia, Dec. 14, 1831. He served on General O'Donnell's staff in the campaign of Morocco, 1859, was with Prim during Spain's brief participation in Mexican affairs in 1861, and joined the army in Cuba in 1869, remaining until 1872. On the abdication of King Amadeus (q.v.), in 1873, he was given several important commands under the Republic, in all of which he distinguished himself by his ability. On Dec. 29, 1874, at Murviedro (Sagunto), in conjunction with General Jovellar, he proclaimed the son of the deposed Queen Isabella, Alfonso XII, King of Spain. The army followed his lead, a ministerial regency under Cánovas del Castillo was formed, and in January, 1875, the youthful Alfonso was established in Madrid and the monarchy was restored. Martínez de Campos brought the civil war to a successful issue by the defeat of the Carlists at Peña de Plata (1876), and was rewarded by the gift of the highest rank in the army. In the same year he was sent to Cuba to conduct the military operations against the insurgents. The central insurgent committee submitted in 1878, and, the insurrection being at an end, Martínez de Campos returned to Spain and became the advocate of a just and liberal policy towards the colony. Cánovas del Castillo resigned March 7, 1879, and Martínez de Campos headed a new ministry, but was unable to hold power for many months. Upon his return to office, however, Cánovas carried out the main features of the General's Cuban programme. In 1881 Martínez de Campos made a coalition with the Liberal leader Sagasta (q.v.), which lasted until 1884, and was Minister of War under him. In 1886, in 1891, and in 1899 he was president of the Senate. In 1893, as Governor of Catalonia, he was wounded by a bomb while suppressing anarchist riots in Barcelona, occasioned by the new taxes of the government, and unsuccessful attempts were made to assassinate him and his family. He was sent to Cuba as captain general upon the outbreak of a new insurrection in 1895, in the hope that he would repeat his former success as a pacificator; but he was recalled in January, 1896, and thereafter took part as a Moderate Liberal in the endeavor to bring about a reorganization of Spanish affairs and a restoration of prosperity. His conspicuous services were highly appreciated both at home and abroad. He was a Knight Grand Cross of the following orders: San Fernando, San Hermenegildo, and Military Merit, in Spain; Tower and Sword, in Portugal; and Leopold, in Austria. He was also a Knight of the Golden Fleece, in Spain; and Grand Cordon of the Legion of Honor, in France.

MARTÍNEZ DE LA ROSA, dā lá rō'sā, FRANCISCO DE PAULA (1789-1862). A Spanish statesman and man of letters. He was born in Granada, March 10, 1789; studied law at the University of Granada, and was appointed lecturer on ethics there when less than 20 years old, and attained some celebrity by a series of epigrams concerning local personages, which he published under the title of *El cementerio de momo*. The French had just invaded Spain, and he entered enthusiastically into the national movement. He was employed by the Junta of Granada to procure arms and supplies at Gibraltar, and he afterward went to England on the same errand. There, in 1811, his first poem, *Zaragoza*, was published. On his return to Spain he produced, at Cadiz, a tragedy called *La*

viuda de Padilla, which was successful and was followed by a comedy, *Lo que puede un empleo*, satirizing political life. In 1813 he was returned to the Cortes from Granada and at once took a high position as an orator. He was a supporter of the constitution of 1812, on the abolition of which, in 1814, Martínez was sentenced to imprisonment for 10 years in the fortress of the Peñón de la Gomera. Released by the insurrection of 1820, he was for a short time head of the ministry, but, having become by 1823 the most unpopular man in the country through his attempt to harmonize all parties, he resigned and took up his residence in Paris. Between 1827 and 1837 he published a collection of his *Obras literarias* in five volumes. In 1830 he was permitted to return to Spain, and began to write an historical novel, *Doña Isabel de Solís*, in imitation of Sir Walter Scott. In March, 1834, he became the head of a Liberal ministry, and was the author of the royal statute of 1834 which created a constitutional government and took away the ancient privileges of the provinces. He was also influential in making the Quadruple Alliance (England, France, Spain, and Portugal), because of which Spain sent an army into Portugal to expel the pretenders Miguel and Carlos. And yet his unpopularity increased so rapidly that he resigned in 1834. On the fall of Queen Maria Christina in 1840 he went to Paris and resumed the composition of *Espíritu del siglo*, a work dealing with the French Revolution, which had been begun in 1835. Upon the fall of Espartero he entered in May, 1844, the Narváez cabinet, and was from 1847 to 1851 Ambassador to Paris. He died at Madrid, Feb. 7, 1862. His periods of exile at Paris threw him into contact with the leaders of the Romantic movement and he was so much impressed that after a successful attempt at a play in French, *Aben-Humeya*, he produced, on his return in 1834, *La conjuración de Venecia*, which opened the way for the Romantic drama in Spain. Consult Godard, *Martínez de la Rosa* (Paris, 1862).

MARTÍNEZ DE ROZAS, dá rōsās, JUAN (1759-1813). A Chilean patriot, born in Mendoza, Argentina (then Chile). He studied in a college in Mendoza and at the University of Santiago de Chile, receiving a degree in law in 1784. He was intendant of the city of Concepción for a number of years, and in 1808 the captain general, Francisco García Carrasco, made him his private secretary, in which position Rozas had opportunity to introduce many reforms. He joined the revolutionary movement in 1810 and was made a member, and later president, of the Junta of Santiago, where his popularity was very great. On account of discords among the patriots he was banished, in 1812, by José Miguel Carrera, to Mendoza, where he died. A man of advanced ideas and republican sentiments, he exercised a remarkable influence in Chile and is called the "founder and teacher of the Chilean nation."

MARTÍNEZ MONTAÑÉS, JUAN. See MONTAÑÉS, JUAN MARTÍNEZ.

MARTINI, mār-tē'nē (OF SIENA) (1439-1502). An Italian architect, born in Siena. He was attached to the courts of Urbino (1476) and Naples (1491). He is chiefly known for his translation of Vitruvius into Italian, and for the beautiful church of Madonna del Calcinajo at Cortona, begun in 1485. The present dome was added after his death by Pietro Nozzi.

MARTINI, GIAMBATTISTA (PADRE MARTINI) (1706-84). An Italian composer and writer on music. He was born at Bologna and studied the elements of music under his father and Padre Predieri, and counterpoint under Antonio Riccieri. In 1729 he entered a Franciscan monastery, after having served as choirmaster at the church of San Francesco, Bologna, since 1725. He wrote two of the most learned treatises on music of the eighteenth century—*Storia della musica* and *Saggio di contrappunto*. Many of his compositions are in manuscript at Vienna and Bologna. His fame as a teacher of composition was very great. He was a firm adherent of the Roman school of composition and wrote a considerable number of works in that style. He died in Bologna. Consult L. Busi, *Il padre, G. B. Martini* (Bologna, 1891).

MARTINI, SIMONE, wrongly called SIMONE MEMMI (?1284-1344). One of the chief painters of the early Sienese school. He was born at Siena, where he studied under Duccio, whose influence was the chief one in the formation of his art. His artistic activity falls into three distinct periods, marked by his residence at Siena, Assisi, and Avignon. From about 1320 to 1333 there are notices of payments to him for works executed for the Palazzo Pubblico and other buildings in Siena. From 1333 to 1339 he was occupied with an important series of frescoes at Assisi. In 1339 he was called by Benedict XII to the papal court at Avignon, where he was employed with his brother Donato in the decoration of the papal palace. He died at Avignon in 1344. With the exception of a few portraits his subjects were religious.

In Siena his important work is a large wall painting in the Palazzo Pubblico, a splendid "Majestas," i.e., the Madonna, surrounded by saints and angels (1315). On the wall opposite this painting is an equestrian portrait of a Sienese captain at arms, Guidoriccio Fogliano (1328), riding through the land—"mediæval pride of life incarnate," as Berenson aptly says. "The Legend of Beato Agostino Novello" in the church of St. Agostino in Siena is also ascribed to him by Berenson. A beautiful altarpiece which was formerly in the Siena Cathedral, "The Annunciation" (1333), was painted by Simone in collaboration with Lippo Memmi, and is now in the Uffizi Gallery at Florence. In the Chapel of St. Martin in the Lower Church at Assisi are a series of magnificent frescoes illustrating the legend of St. Martin and other saints. In Naples at the church of San Lorenzo is a fresco, "St. Louis of Toulouse Crowning his Brother Robert" (1324), painted when the church was completed by King Robert I. At Avignon there are fragments of frescoes attributed to him by Berenson and others. In the papal palace and cathedral and in the chapel of St. John there are frescoes illustrative of the life of that saint. The chief characteristics of his painting are its splendid decorative quality, its gorgeous yet harmonious color, its flowing line. His other works include: Polyptychs in the Opera del Duomo, Orvieto, and at Pisa (both c.1320), and in Fenway Court, Boston, and the former Avignon altarpiece, with scenes from the Passion, parts of which are in Paris, Berlin, and Antwerp. Consult Bernhard Berenson, *Central Italian Painters of the Renaissance* (New York, 1897).

MARTINIQUE, mār-té'nēk'. An island and French colony of the Lesser Antilles, situated between lat. 14° 23' and 14° 52' N. and on the

meridian of 61° W., between Dominica on the north and St. Lucia on the south (Map: West Indies, G 4). Area, 381 square miles. The island is in greater part of volcanic origin, the loftier elevations (Mont Pelée, in the north-west, now about 4900 feet in elevation; the Pitons du Carbet, 3960 feet; the Vaulin, in the south) being all of lava or agglomerate masses, whose age dates back to some portion of the Tertiary period. Isolated patches of limestone, of Miocene and Pliocene age, occur in the east and in the south (near Trinité, the Marin, etc.), and there is also a detached bordering of recent coral structures. Much of the interior surface is a comparatively recent alluvium, formed from the disintegration of the prehistoric lavas. The relief of the land is essentially mountainous, the *mornes* and *pitons* rising with marked abruptness and forming the landscape that is so distinctive of most of the inner (volcanic) islands of the Lesser Antilles. Between these are valleys of beautifully flowing contour and deeply incised cañon-like troughs. The culminating point of the island is Mont Pelée, whose height has increased by nearly or fully 700 feet since May, 1902.

A large part of the island, somewhat over a third, is under cultivation. The principal crop is sugar cane, but a superior grade of cacao has been raised with success and profit; coffee, tobacco, and cotton are grown in some parts. Where not under cultivation the island is still largely covered with woodland, and a forest of strictly tropical luxuriance is found in scattered spots. The higher animal life is not very abundant, and its characteristics are largely South American, marked with the deficiencies that belong to insularity. Of the seemingly native animals the opossum, which has been known in the island for upward of 200 years, is the most notable. Of the birds the most abundant or common species is probably the Martinique blackbird. Of the dreaded fer-de-lance serpent, which was at one time very abundant, but few individuals remain to-day, the animal having been all but exterminated by the introduced mongoose.

The interior of the island is crossed by well-constructed highroads, but there are as yet no railways, excepting a few that are used in private transport on the cane plantations. The climate is on the whole salubrious, and the heat is measurably tempered, especially on the eastern side, by the steadily blowing trade winds, the temperature only exceptionally rising above 92° F. to 94° F. The humidity is, however, high. July and August are ordinarily the most rainy months, and February, March, and April the months of least rainfall. The annual precipitation is from 85 to 95 inches. Earthquakes are of frequent occurrence. That of 1839, which destroyed a large part of Fort de France, was particularly destructive. The only historically recorded volcanic eruptions that took place before the year 1902 were those of 1762 and August, 1851, both of Mont Pelée. See PELÉE, MONT.

Of the population much the greater part consists of the colored races, especially negroes and mulattoes; hardly a vestige, except in mixture, remains of the ancient Carib Indians. In 1878 the inhabitants numbered 162,861; in 1888, 175,863; in 1901, 203,781; in 1905, 182,024; in 1911, 184,084. The capital of the colony is Fort de France, which had 22,164 inhabitants

in 1901 and 26,935 in 1911. Other important towns are Lamentin, Ste. Marie, Trinité, François, Robert, Gros Morne, St. Joseph, and Carbet, with populations ranging from 6000 to nearly 11,000. St. Pierre, of which nothing but ruins now remain, was, up to the time of its destruction, the largest and most important town on the island.

The colony is administered by a governor (appointed by the home government of France) and a general council, and there are elective municipal councils. It is represented in the French Parliament by one senator and two deputies. In 1890, in the general trade, imports and exports were valued at 30,261,000 and 23,350,000 francs respectively; in 1900, 24,763,000 and 26,979,000; in 1910, 19,563,000 and 27,587,000; in 1912, 21,520,000 and 30,523,000. In 1912 the trade with France amounted to 11,510,000 francs imports and 28,574,000 francs exports. In 1911 there were entered 88 vessels, of 156,000 tons. The island of Martinique was discovered by Columbus, who subsequently landed near Carbet, on June 15, 1502. In 1635 a fort was erected by the Frenchman D'Esneembuc on the site of the later St. Pierre. The English took the island repeatedly from the French, holding it for the last time during the Napoleonic wars. Slavery was abolished by decree of April 27, 1848. The Empress Josephine was born at Trois-Îlets.

MARTINIQUE, PETIT. See GRENADINES.

MARTIN MARPRELATE CONTROVERSY. A bitter religious dispute of the Elizabethan period. It was occasioned by the publication, 1588-89, under the name of Martin Marprelate, Gentleman, of a number of bitterly personal tracts directed against what the writer conceived to be abuses in Church and state, and against certain bishops in particular. The publisher and chief instigator was John Penry (q.v.), or Ap-Henry, a Puritan preacher, abetted by Sir Richard Knightley of Northamptonshire, Job Throckmorton of Warwickshire, and others. The tracts were printed on a rude and peripatetic press, at Kingston-on-Thames, Coventry, Manchester, etc., and provoked in reply a great number of abusive books and pamphlets. Martin's broad satires were disapproved by devout Puritans, but undoubtedly they were powerful factors in furthering the Puritan cause. Great efforts were made to discover and apprehend the authors. Penry was executed in 1593. Henry Barrow, one of his assistants, to whom the chief responsibility for the tracts has sometimes been attributed, also suffered death in the same year. The tracts have been reprinted by Arber in the *English Scholar's Library* (London, 1878 et seq.). Consult: William Maskell, *A History of the Martin Marprelate Controversy* (London, 1845); E. Arber, *Introductory Sketch to the Martin Marprelate Controversy* (ib.,

1879); H. M. Dexter, *Congregationalism of the Last 300 Years as Seen in its Literature* (New York, 1880); J. D. Wilson, in *Cambridge History of English Literature*, vol. iii (Cambridge, 1909); William Pierce, *Historical Introduction to the Marprelate Tracts: A Chapter in the Evolution of Religious and Civil Liberty in England* (New York, 1909).

MARTINMAS. A festival celebrated on St. Martin's Day, November 11. Luther was born on the eve of the festival, and therefore received the saint's name.

MARTIN OF TOURS, tōōr (c.316–c.400). Bishop of Tours and patron saint of France. He was born at Sabaria, Pannonia, of heathen parents, about 316. He was educated at Pavia, and at the desire of his father, who was a military tribune, entered the army at an early age under Constantine the Great. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service (336), Martin became a disciple of Hilary (q.v.), Bishop of Poitiers. He returned home and converted his mother to Christianity, but he himself endured much persecution from the Arian party, who were at that time dominant; and in consequence of the firmness of his profession of orthodoxy he is the first who, without suffering death for the truth, has been honored in the Latin church as a confessor of the faith. On his return to Gaul, about 360, he sought a hermit life in Ligugé, near Poitiers, where soon monks gathered about him and a convent was established. In 371 he was drawn by force from his retreat and ordained Bishop of Tours. The fame of his sanctity and his repute as a worker of miracles attracted crowds of visitants from all parts of Gaul; and in order to avoid the distraction of their importunity he established a monastery near Tours, in which he resided. He died at Candé (Candeum) about 400. His life is the subject of a great number of legends. In the Roman Catholic church the festival of his birth is celebrated on November 11. Consult: Charnard, *St. Martin et son monastère* (Poitiers, 1873); J. G. Cazenove, *St. Hilary of Poitiers and St. Martin of Tours* (London, 1883); Sculard, *Martin of Tours, Apostle of Gaul* (ib., 1891); *Cambridge Medieval History*, vol. i (Cambridge, 1911).

MARTIN PROCESS. See IRON AND STEEL, *Open-Hearth Process*.

MARTINSBURG. A city and the county seat of Berkeley Co., W. Va., 75 miles west of Washington, D. C., on the Baltimore and Ohio and the Cumberland Valley railroads (Map: West Virginia, F 2). Its most prominent structures are the United States courthouse and post office, King's Daughters and city hospitals, and the county courthouse. The industrial interests are represented by railroad repair shops, woolen, cassimere, and hosiery mills, grain elevators, flour mills, clothing factories, distilleries, lime works, extensive slate and limestone quarries, wagon and carriage shops, lumber and planing mills, automobile works, and cement plants. The surrounding region is rich in fruit, particularly apples and peaches, and there are important live-stock and agricultural interests. The municipality is governed by a mayor, elected every two years, and a unicameral council. The executive power is vested in an appointed board of affairs. The city owns and operates the water works. Martinsburg was founded and

incorporated as a town in 1778. Pop., 1900, 7564; 1910, 10,698; 1914, 12,032; 1920, 12,515.

MARTINS FERRY. A city in Belmont Co., Ohio, on the Ohio River, nearly opposite Wheeling, W. Va., and on the Baltimore and Ohio, the Wheeling and Lake Erie, and the Pennsylvania railroads (Map: Ohio, J 5). It is in an agricultural, bituminous-coal, and limestone region, and, besides productive coal mines, has extensive manufactures of iron, steel, tin, glass, machinery, heaters, galvanized-iron products, stoves, boxes, and barrels. Walnut Grove Cemetery is interesting as the burial place of persons prominent in the history of the settlement of the Ohio valley. Settled about 1769, Martins Ferry was incorporated as a village in 1865. It is governed under the Ohio municipal code, which provides for a mayor, elected biennially, and a unicameral council. The water works and electric-light plant are owned and operated by the municipality. Pop., 1900, 7760; 1910, 9133; 1914 (U. S. est.), 9718; 1920, 11,634.

MARTINSVILLE. A city and the county seat of Morgan Co., Ind., on the White River, 30 miles southwest of Indianapolis, on the Vandalia and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Indiana, E 6). It is widely noted for its artesian mineral wells and has several large sanatoriums. The city contains a Carnegie library and has flour, saw and planing mills, woodenware factory, chair factory, and brick plants. The water works and electric-light plant are owned by the municipality. Pop., 1900, 4038; 1910, 4529.

MARTINSVILLE. A town and the county seat of Henry Co., Va., 40 miles (direct) west by north of Danville, on the Norfolk and Western and the Danville and Western railroads (Map: Virginia, E 5). Attractive features of the town include the courthouse, municipal building, post-office and high-school buildings, and the Roundabout stock farm. There are cotton mills, furniture factories, tobacco warehouses, and spoke factories. Farming is also engaged in extensively. Martinsville owns its water works, electric-light and telephone plants. Pop., 1900, 2384; 1910, 3368.

MARTINUS SCRIBLERUS, mār-ti'nūs skrib-le'rūs, MEMOIRS OF (Neo-Lat., Martin Scribbler). An extensive satire (1741), written principally by John Arbuthnot (q.v.), with Swift and Pope also among the contributors. Its aim was at one with that of the Martinus Scriblerus Club, formed by the men above named at Pope's suggestion with a view to satirizing literary dullness and incompetence. The chief monument of the association is Pope's contribution to the labors of the club—*The Dunciad* (completed 1741).

MARTINUZZI, mār'tē-nōō't'sé, GEORG (GYÖRGY UTIŠENOVIC), also known in Hungarian history as FRATER GEORGIUS (or GYÖRGY) (1482–1551). A Hungarian statesman, born at Kamičie in Croatia. He entered the Pauline order in 1510; became Bishop of Grosswardein in 1534; and was consecrated Archbishop of Esztergom and made Cardinal in 1551. His political career began with his successful negotiations with Ferdinand for the return of Buda to John Zapolya, King of Hungary, in 1529. Thereafter he was treasurer and chief councilor of Zapolya, and upon the latter's death in 1540 was Regent of Hungary and guardian of the infant King, John Sigismund. He was opposed in his policies by the Queen mother, Isabella,

who sought to bring in the Austrians, but he defeated her purpose. For 10 years subsequently he brilliantly maintained a trying and perilous position between the mutually hostile Austrians and Turks; but finally he was assassinated by the permission of Emperor Ferdinand, who accused the frater of treason.

MARTINY, mär-tē'nī, PHILIP (1858--). An American sculptor. He was born in Alsace, where he studied under Eugène Dock. In the early eighties he came to the United States and entered the studio of Augustus Saint-Gaudens. He did much to raise the standard of decorative sculpture in the United States. His conceptions are original and spontaneous, his execution skillful, his modeling simple yet rich. Among his best-known decorative works are the sculpture for the grand staircase of the Congressional Library, Washington, for the Carnegie Library, Washington, and for the Hall of Records, New York; the bronze doors of St. Bartholomew's Church, New York; two groups in the Chamber of Commerce, New York; and figures and a fountain for Senator Clark's residence in New York. Among his monumental works are the Soldiers and Sailors Monument, Jersey City; the McKinley Monument, Springfield, Mass.; the monument to Admiral de Gernay, Newport, R. I., and the portrait statue of Vice President Hobart, Paterson, N. J.

MAR'TITE. A form of hematite (q.v.) pseudomorphous after magnetite.

MARTITZ, mär'tits, FERDINAND VON (1839--). A German international law scholar, born in Insterburg and educated at Königsberg and Leipzig. He taught at Königsberg from 1864 to 1872, was professor at Freiburg in 1872-75 and at Tübingen from 1875 to 1898, and then was appointed to a chair in Berlin. In 1898-1903 he was a member of the Prussian Oberverwaltungsgericht, and he was a member of the permanent Court of Arbitration at The Hague. His published works include: *Internationale Rechtshilfe in Strafsachen* (1888-97); *Die Monarchie als Staatsform* (1903); *Völkerrecht* (2d ed., 1913); and he contributed the section on international law to the volume *Systematische Rechtswissenschaft* (1913) in the Teubner series "Kultur der Gegenwart."

MARTIUS, mär'tsi-us, KARL FRIEDRICH PHILIPP VON (1794-1868). A distinguished German traveler and naturalist, born and educated in medicine at Erlangen. He went to Brazil (1817-20) as a member of a scientific expedition sent out by the Austrian and Bavarian governments, and by his researches in that country acquired a reputation second only to that of Humboldt. He was specially intrusted with the botanical department, but his researches extended to ethnography, statistics, geography, and natural science in general; and his works, published after his return, exhibited a poet's love of nature and great powers of description. He was professor of botany and director of the Botanic Garden at Munich from 1826 until he retired in 1864. Among his works are: *Reise nach Brasilien* (1824-31); *Nova Genera et Species Plantarum* (1824-32); *Icones Plantarum Cryptogamicarum* (1828-34). He also published a most valuable monograph on palms, *Historia Naturalis Palmarum* (1823-53); *Die Pflanzen und Thiere des tropischen Amerika* (1831); *Das Naturell, die Krankheiten, das Arzttum und die Heilmittel der Urbewohner Brasiliens* (1843); *Beiträge zur*

Ethnographie und Sprachenkunde Amerikas (1867). Consult Meissner, *Denkschrift auf Karl F. P. von Martius* (Munich, 1869).

MARTIUS' YELLOW. See COAL-TAR COLORS.

MARTLET (probably for *marlet, *merlet, from OF. *merlette*, *merlotte*, probably the dim. of *merle*, blackbird, from Lat. *merula*, blackbird). In heraldry (q.v.), a martin without legs or beak. Also used as the difference for the fourth son.

MARTOS, mär'tós. A town of south Spain, in the Province of Jaén, situated among the mountains 15 miles southwest of Jaén (Map: Spain, D 4). It is built on the slope of a steep hill, surmounted by a ruined castle, has mineral baths and exports excellent olive oil, produced in the surrounding district. Pop., 1900, 16,682; 1910, 17,025.

MARTOS Y BALBÍ, mär'tós ē bäl-bé', CRISTINO (1830-93). A Spanish politician, juriconsult, and orator. Born at Granada, he studied letters and philosophy there and at Toledo and jurisprudence at Madrid. In 1851, while still a student at Madrid, he started a student rebellion against a recently decreed law concerning public instruction. The example of Madrid was followed in other university centres throughout the country, and the government dismissed from their respective universities for one year Martos and a few others of the leaders. This was the beginning of a stormy political career that obliged him to stay abroad from 1866 to 1869, when he returned and was elected to Congress. In 1874 he resumed his law practice, but in 1879 he was again elected deputy and by successive re-elections continued to serve in that capacity the rest of his life. He held various portfolios under various ministries and was for a while president of the Congress.

MARTUCCI, mär-tōot'chè, GIUSEPPE (1856-1909). An Italian composer and pianist, born at Capua. Having received his first musical instruction from his father, a trumpet player, he entered the Conservatory of Naples in 1867. Here he studied piano and composition under Costa, Cesi, Serrao, and Rossi, graduating in 1872. Two years later he was appointed professor in that institution. As conductor of the concerts established by Prince d'Ardore he won fame. Beginning his career as a concert pianist in 1875, he visited Germany, France, and England, meeting everywhere with signal success. In 1886 he accepted the position of director at the Liceo Musicale of Bologna, where he also conducted at the Opera. Here he scored a phenomenal success in 1888, when he conducted the first performance in Italy of *Tristan und Isolde*. From 1902 until his death he was director of the Conservatory at Naples. He is one of the few modern Italian composers who have won a high rank in the field of pure instrumental music. His works include two symphonies, two concertos for piano and orchestra, a piano quintet, two piano trios, a sonata for piano and cello, several string quartets, an organ sonata, numerous compositions for piano.

MARTVYEEV, mär't-vyā'ef, ARTAMON SERGEYEVICH (?-1682). A Russian statesman. He gained distinction as a scholar and author; became chief counselor of Czar Alexius in 1671; and attained the rank of boyar (q.v.) in 1674. When Alexius died Martvyeev proposed to have the Czarevitch Peter elevated to the throne instead of the sickly Theodore, but the hostile

boyars and relatives of Theodore proclaimed him Czar and banished Martvyev from court. When Peter (the Great) was proclaimed in 1682, Martvyev was summoned to court as Peter's chief adviser, but was immediately killed by rebellious musketeers. His political and educational reforms under Alexius had an important influence on the later introduction of western ideas in the reign of Peter the Great.

MARTY, mār'té', GEORGE EUGÈNE (1860-1908). A French composer and orchestral conductor, born at Paris. He was a pupil of Massenet at the Conservatory and in 1882 won the Prix de Rome with his cantata *Edith*. In 1892 he took charge of the ensemble classes at the Conservatory, and also acted as chorus master at the Théâtre Eden. During the season of 1895-96 he was conductor at the Grand Opéra. During his incumbency as conductor of the Concerts du Conservatoire from 1901 to his death he proved himself one of the greatest concert conductors France ever produced. His compositions include the operas *Le Duc de Ferrare* (1899) and *Daria* (1905); a pantomime, *Lysie*; an overture, *Belsazar*; a *Suite romantique*; a symphonic poem, *Merlin enchanté*; piano pieces and songs.

MARTYN, mār'tin, (WILLIAM) CARLOS (1841-). An author and Congregational minister, born in New York City. After graduating from Union Theological Seminary in 1869 his first charge was in St. Louis, and afterward he held pastorates at Portsmouth, N. H., New York City (1876-90), Newark, and Chicago (1892-94). From 1897 to 1903 he was literary director of the Abbey Press, New York. Thereafter until 1905 he lectured and served occasionally as a supply, and in 1906 he became pastor at Noroton, Conn. His work includes: *Life of John Milton* (1865); *Life of Martin Luther* (1865); *History of English Puritans* (1866); *History of the Huguenots* (1867); *The Dutch Reformation* (1869); *History of the Pilgrim Fathers* (1870); *Wendell Phillips, the Agitator* (1891), for the "American Reformers Series," of which he was editor; for the same series, *William E. Dodge, the Merchant* (1891) and *John B. Gough* (1894); *Christian Citizenship* (1896); *Sour Saints and Sweet Sinners* (1898), a novel.

MARTYN, mār'tin, EDWARD (1859-). An Irish dramatist, educated at Belvedere College, Dublin, at Beaumont College, Windsor, and at Oxford, who played an important part in the Irish literary revival. It was he who, with Lady Gregory and George Moore, founded the Irish National Theatre, and he met the expenses of its initial performances; and it was his *The Heather Field* and W. B. Yeats's *Countess Kathleen* that in 1899 inaugurated the dramatic activities which that theatre, under changing names, was creditably to continue. An ardent patriot and an ardent Catholic, his convictions color his dramatic and other writings. His plays show the Ibsen influence. His interest in music led him to establish a fund of \$50,000 to found a Palestrina choir in Dublin. In addition to *The Heather Field* and a satire, *Morgante the Lesser* (published under the pen name of Sirius in 1890), Martyn wrote: *Maève* (1899); *The Tale of a Town* (1902); *An Enchanted Sea* (1902). Consult George Moore's *trilogy Hail and Farewell* (New York, 1911-13), *passim*, for information regarding Martyn's part in certain phases of the Irish literary revival, and see IRISH LITERATURE, *Irish Literature in English*.

MARTYN, HENRY (1781-1812). An English missionary. He was born at Truro, Cornwall, England, Feb. 18, 1781, of humble origin. In 1797 he entered St. John's College, Cambridge, and in 1802 was chosen fellow of his college. After receiving ordination in 1803 he served as curate to the Rev. Charles Simeon (q.v.). In 1805 he sailed for India as chaplain in the East India Company's service, and reached Calcutta in May, 1806; in September he received his appointment to Dinapur, and soon conducted worship among the natives in their own language and established schools for their instruction. In 1809 he was stationed at Cawnpore. While here he translated the New Testament into Hindustani and Persian, the Psalms into Persian, and the Prayer Book into Hindustani. His unremitting labor in the Indian climate affected his health, and he sought restoration in a voyage to Persia. He penetrated to Shiraz, where he revised, with the aid of learned natives, his Persian and Arabic translations of the New Testament and held discussions with the native scholars, many of whom were greatly impressed. In view of the effect of his frequent discussions, and of his being engaged in a translation of the New Testament into Persian, the preceptor of all the mollahs wrote an Arabic defense of Mohammedanism. To this Martyn replied in Persian. Ill health again compelling him to change his plans, he decided to return to England, and in September, 1812, set out overland for Constantinople. At Tokat in Asia Minor his utter prostration compelled him to stop, and he died there, Oct. 16, 1812. A monument was erected at Tokat in 1856. Besides the translations mentioned he was the author of *Controversial Tracts on Christianity and Mohammedanism* (1824). The story of his brief career had a great missionary influence in both Great Britain and America. Consult: *Journals and Letters of the Reverend Henry Martyn*, edited by Samuel Wilberforce (2 vols., London, 1837); C. D. Bell, *Henry Martyn* (New York, 1881); George Smith, *Henry Martyn, Saint and Scholar, First Modern Missionary to the Mohammedans, 1781-1812* (London, 1892).

MARTYN, THOMAS (1735-1825). An English clergyman and botanist, born at Church Lane, Chelsea. He graduated at Emmanuel College, Cambridge, in 1756, became a fellow of Sidney Sussex College, and was ordained priest in 1759. From 1762 to 1825 he served as professor of botany at Cambridge, succeeding his father, John Martyn, who had held the same position for 28 years. Thomas Martyn was not only a distinguished teacher of his subject in Cambridge, but was the author of several books, the best known of which was the translation and continuation of Rousseau's *Letters on the Elements of Botany*, the eighth edition of which appeared in 1815. This was the standard English text for a long period. He also wrote *The Language of Botany* (1793), a dictionary of botanical terms and notes, and was one of the editors of *A Botanical Dictionary*, which was published in the United States in 1817. Much interested in insects, he published a *Natural History of Spiders, The Coleoptera*, etc., and also extended his interest to other fields of zoölogy, publishing, among other works, *The Universal Conchologist*.

MARTYNIA (Neo-Lat., named in honor of John Martyn, an English botanist of the eighteenth century). A genus of eight or 10 species

of unpleasant smelling, low, branching annual or thick-stemmed perennial plants with tuberous roots, belonging to the family Martyniaceæ, mostly natives of warm countries. The leaves are simple, rounded; flowers large, bell-shaped, and somewhat two-lipped, very similar to catalpa flowers, borne in racemes; the fruit is a pod

MARTYNIA (UNICORN PLANT).

with a long incurved beak; when ripe it splits into two-hooked horns, opening at the apex. The seeds are numerous, black, with a thick, wrinkled coat. *Martynia louisiana*, unicorn plant, which grows on river banks and waste places in southern Indiana and Illinois and southwestward, is cultivated in gardens for its fruit, which, when the pods are young, is used for making pickles. The leaves of this species are heart-shaped, oblique, entire, the upper alternate; corolla dull white or purple or spotted with yellow and purple; endocarp of the fruit crested on one side, long-beaked. *Martynia fragrans*, from New Mexico, has violet-purple flowers, with a rather pleasant odor, somewhat like that of vanilla.

MARTYR (AS., Lat. *martyr*, from Gk. *μάρτυς*, *martyrs*, *μάρτυρ*, *martyr*, witness; connected with Lat. *memor*, mindful, Skt. *smar*, to remember). The name given in ecclesiastical history to those who bore witness to their faith by death, though the title was not strictly confined to these, but usually extended to those who were condemned to torture, to hard labor in the mines, or to banishment. On the other hand, it was not attributed to those who sought death by self-denunciation or by public breaking of the statues of the gods. The common teaching of the Fathers was that martyrdom, hence called the baptism of blood, supplied the place of the ordinary baptism where there was no opportunity to receive the sacrament. The martyrs were specially venerated by their fellow Christians. As it was held that their superabundant merit might, in the eyes of the Church, compensate for the weakness of less perfect brethren, a practice arose by which martyrs awaiting death gave to those sinners who were undergoing public penance letters of commendation to their bishop in order that their course of penance might be shortened. (See *INDULGENCE*.) The death of a martyr was reported to the bishop of the place, who decided whether he was entitled to the name; this early form of canonization made him a *martyr vindicatus*. By the beginning of the twelfth century the decision was

becoming more generally, and since Urban VIII (1636) has been absolutely, reserved to the Pope. The martyrs, who were the earliest saints to be honored by a special anniversary commemoration, have in later times received a special precedence in liturgical rank—their names in the litany of the saints, e.g., coming immediately after those of the Apostles. In the old Roman calendar there was a common feast of all the martyrs, of which Gregory III, when in 731 he transferred it to November 1, widened the reference to include all saints. The number of the martyrs of the early ages was undoubtedly great, although Gibbon and others have attempted to minimize it. Ruinart among older scholars and Cardinal Wiseman in modern times have given strong evidence in confirmation of the large numbers. The Roman martyrology alone contains 14,000 names.

MARTYR, PETER. A writer on early American history. See *PETER MARTYR*.

MARTYR, PETER. An Italian Reformer. See *VERMIGLI, PIETRO MARTIRE*.

MARTYRE DE SAINT SÉBASTIEN, *mār'tēr' de sãn sã'bãs'tyãn'*, LE (Fr., The Martyrdom of St. Sebastian). An oratorio by Debussy (q.v.), first produced in Paris, May 22, 1911.

MARTYROL'OGY (ML. *martyrologium*, MGk. *μαρτυρολόγιον*, from Gk. *μάρτυρ*, *martyr*, martyr + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). A calendar of martyrs (see *MARTYR*), and sometimes of other saints, arranged in the order of months and days. It early became usual to write on diptychs or folding tablets the names of Christians, living or dead, who were to be especially commemorated in the celebration of the Eucharist. Thus were inscribed particularly the names of martyrs whose anniversaries were honored. These, which were at first only lists of names, were gradually expanded, and by combining the records of various churches complete martyrologies were made. The oldest extant martyrology is probably a Syrian one of the year 412 (see below), though the so-called *Martyrologium Hieronymianum* may be almost contemporary with it, at least in part. This has been ascribed to St. Jerome, possibly because he translated and commented upon the work of Eusebius, *De Martyribus Palestinæ*. It was compiled in Italy, probably in the fifth century, and revised in Gaul about 600. An old Roman martyrology was known to Bede and to a contemporary French monk, Usnard, whose work forms the basis of the later Western martyrologies, as officially published in Rome by Baronius in 1586, and also in the revised editions by direction of various popes (by Pius IX in 1873).

Bibliography. Wright, *An Ancient Syrian Martyrology* (London, 1865); Lämmer, *De Martyrologio Romano, Parergon Historico-criticum* (Regensburg, 1878); the edition of the *Martyrology of St. Jerome*, in *Acta Sanctorum*, November, 1894 (Paris, 1894); Achelis, *Die Martyrologien, ihre Geschichte und ihr Wert* (Berlin, 1900); *The Roman Martyrology*, translated by F. P. Kenrick (Baltimore, 1907); Delhay, "Le témoignage des martyrologes," in *Analecta Ballandiana*, xxvi (Paris, 1907).

MARTYRS, *mār'tēr'*, LES. A prose work by Chateaubriand (1809). It is the story of two Christian lovers at the end of the third century, during Diocletian's persecutions.

MARUCCHI, *mã-röök'kê*, ORAZIO (1852-). An Italian archaeologist. He was born in

Rome and became an eminent authority on Egyptology and on Christian archaeology, especially of the city of Rome. He was director of the Egyptian museum in the Vatican and of the Christian museum of the Lateran, and filled the chairs of Christian archaeology in the College of San Apollinare and the University of Rome. Marucchi was editor of the *Nuovo Bulletin di Archeologia Cristiana* (1895), which carried on the work of De Rossi; and he published *Gli obelisch egiziani di Roma* (1898); *Il museo egizio vaticano* (1899); *La santità del matrimonio confermata degli antichi monumente cristiani* (1902); *Le catacombe romane* (1905, also in French); *Manuale di archeologia cristiana* (1908); *Epigrafia cristiana* (1910); *I Monumenti del museo cristiano pio-lateranense* (1910); *Guide du Forum romain et du Palatin* (1911); *Il cimitero di Priscillo*, etc. (1913).

MARUÉJOULS (PIERRE ADOLPHE) EMILE (1837-1908). A French statesman, born at Villefranche-de-Rouergue (Aveyron). He studied law at Paris, and in 1889 was elected deputy from Villefranche and thereafter was successively reelected. He was a member of the consulting committees on railways and of the superior councils on fine arts and commerce. In 1898, in the Brisson ministry, he was Minister of Commerce and Industry, and from 1902 to 1905, in the Combes ministry, he was Minister of Public Works. He served as chairman of the French delegation at the International Railway Congress which met in Washington in 1905. An Officer of the Legion of Honor and the recipient of decorations from numerous foreign governments, he contributed to several reviews and periodicals, such as *La Gazette des Beaux-Arts* and *Le Temps*. In 1869 he was awarded a prize for eloquence by the French Academy.

MARULIĆ, mā-rōō'lish, MARKO (1450-1524). A Croatian poet and scholar, born at Spalato. He studied at Padua and entered a monastery in his native town. His works in Latin deal with politics, theology, and history; the best known was *De Institutione Bene Vivendi* (probably first printed in 1506), which passed through many editions and was translated into several languages. More important than his Latin and Italian works are his poems in the vernacular, which mark him as the "father of Croatian poetry" and one of the great names of the literature of Ragusa. The best known is an epic on the *History of Judith* (*Historija sv. Judite*), written in 1501 but published 20 years later. He also wrote some mystery plays (*prikazanija*), which are the first dramatic composition in Croatian. His works in the vernacular were republished at Agram (1869) by Kukuljević-Sakčinski, with a biographical sketch of Marulić.

MARUTS, mā-rōōts' (Skt., probably the shining ones). In Hindu mythology, the gods of the storm and the wind. They play a prominent part in the *Rig-Veda*, especially as allies or associates of Indra (q.v.), and vary in number, usually thrice seven or thrice sixty. The hymns addressed to them, as they crash through the forests, make the mountains quake, or sweep the plain, accompanied by lightning, dust, and rain, are among the most spirited in the *Veda*. They have been translated by Max Müller, *Sacred Books of the East*, vol. xxxii (Oxford, 1891). In post-Vedic times Marut is used in the singular, meaning wind or the god of the wind. Consult A. A. Macdonell, *Vedic My-*

thology (Strassburg, 1897), and W. J. Wilkins, *Hindu Mythology* (London, 1900).

MARVEL, ĩk. The pseudonym of Donald G. Mitchell.

MARVELL, ANDREW (1621-78). An English poet and politician. He was born March 31, 1621, at Winestead, Yorkshire; attended the grammar school at Hull, of which his father became master; graduated B.A. at Trinity College, Cambridge (1638); traveled on the Continent (1642-46); returned to England about 1650; was tutor to Lord Fairfax's daughter Mary; became assistant to Milton in his Latin secretaryship of state (1657); and was elected to Parliament from Hull (1659). From 1663 to 1665 he was secretary to Charles Howard, first Earl of Carlisle, on his embassy to Muscovy, Sweden, and Denmark. Without fortune or influence, possessing no commanding talent as a speaker, he maintained a character for integrity so genuine and high that his constituency felt itself honored by his conduct, and allowed him to the end of his life "a handsome pension." Charles II made fruitless efforts to win him over to the court party. Marvell died Aug. 18, 1678. Marvell was a man of varied talents and of poetic genius. He was a competent man of affairs. As a potent pamphleteer, his reputation was high among his contemporaries, but his controversial writings make little appeal to posterity. His satires have shared much the same fate as his pamphlets, because they are bound up, as lampoons, with incidents and people of his day now forgotten, and partly because their humorous exaggeration, mordant irony, and comic verve cannot atone for artistic failings. In his best poetry Marvell rises, as Lamb well says, "to the highest strains of passion and imagination," abjuring the conceits, the mere fanciful ingenuity, and the witty delicacy which give a certain quaint attraction to his verse, but frequently obscure the meaning. The high-water mark of his poetry is the "Horatian Ode" to Cromwell, but his many and varied lyrics, such as "The Garden," "A Drop of Dew," "To his Coy Mistress," "The Bermudas," and "Young Love," are, of their kind, faultless. His works were published as follows: *Miscellaneous Poems* (1681); *Works* (2 vols., 1726), edited by Thomas Cooke; *Works*, including letters and prose pamphlets (3 vols., 1776), edited by Edward Thompson; *Works*, including prose works and letters, as well as poems, with annotations, in Fuller Worthies Library, 3 vols. (1872, 1875), edited by Dr. Grosart; *Poems and Satires* (2 vols., 1892), edited by G. A. Aitken; *Poems and Satires* (1904), edited by Edward Wright. Consult the *Life* by Dove (London, 1832); the critical biography by Augustine Birrell, in "English Men of Letters Series" (ib., 1905); John Brown, in *Cambridge History of English Literature*, vol. vii (Cambridge, 1911).

MARVEL OF PERU, pē-rōō'. A garden plant. See JALAP.

MARVELOUS BOY, THE. A title given to Thomas Chatterton.

MARVIN, CHARLES FREDERICK (1858-). An American meteorologist, born at Putnam, Ohio. In 1883 he graduated from Ohio State University and in the following year he was appointed on the civilian corps of the signal service of the United States. In 1903 he became professor of meteorology in the Weather Bureau, and in 1913 chief. He conducted important experiments for determining the amount

of moisture in the air and for measuring wind velocities and pressures; invented instruments for automatically measuring and recording rainfall, snowfall, sunshine, and atmospheric pressure; made investigations furthering the use of kites in meteorology; and aided the advancement of seismological and solar radiation experimentation. He contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA*, and is the author of numerous pamphlets and papers published by the Weather Bureau and scientific magazines, under such titles as *Anemometry*, *Barometers and the Measurement of Atmospheric Pressure*, *Kite Experiments at the Weather Bureau and the Mechanics and Equilibrium of Kites*, *The Collection and Measurement of Precipitation*, *Psychrometric Tables and the Measurement of Vapor Pressures at Low Temperatures*, *The Collection and Measurement of Precipitation with Special Reference to Snowfall*.

MARVIN, ENOCH MATHER (1823-77). An American bishop, born in Warren Co., Mo. He was a self-educated man. He entered the ministry of the Methodist Episcopal church in 1841, joining the Missouri Conference, but at the time of the division of the church in 1844 identified himself with the Church South. For a time he was agent for St. Charles College. During the Civil War he served for two years as chaplain with the Confederate army, under General Price. In 1866 he was elected a bishop of the Methodist Episcopal Church South; in 1877 he completed a missionary tour around the world. He was a noted preacher and was the author of *Errors of the Papacy and Transubstantiation* (1860); *The Life of William Goff Caples* (1871); *Sermons* (1876); *The Doctrinal Integrity of Methodism* (1878); *To the East by Way of the West* (1879); *The Methodist Episcopal Churches, North and South* (n. d.). Consult T. M. Finney, *The Life and Labors of Enoch Mather Marvin* (St. Louis, 1880).

MARWAR, mār'wēr. A native state of India. See JODHPUR.

MARX, märks, ADOLF BERNHARD (1795-1866). A German writer on musical subjects, born at Halle. He studied law and practiced it for a short time, but soon devoted himself exclusively to music and became editor of the Berlin *Allgemeine Musikalische Zeitung*. In 1830 he was made professor of music at the Berlin University and in 1832 obtained the post of musical director at the university. Together with Kullak (q.v.) and Stern he founded in 1850 the Sternsche Konservatorium, which is still one of the foremost music schools of Germany. His works include: *Die Lehre von der musikalischen Komposition* (1837-45); *Allgemeine Musiklehre* (1839; 10th ed., 1884); *Ludwig van Beethoven: Leben und Schaffen* (1859; 4th ed., 1884); *Gluck und die Oper* (1862); *Das Ideal und die Gegenwart* (1867).

MARX, KARL (1818-83). A great economist and socialist, properly to be regarded as the founder of the modern Socialistic movement. He was born of Jewish parents at Treves, Germany, May 5, 1818, and educated at the universities of Bonn and Berlin. In 1842 he joined the staff of the *Rheinische Zeitung für Politik, Handel und Gewerbe*, a Liberal organ, and for a short time he was editor of the paper. Shortly before the suppression of the paper, in 1843, Marx withdrew from the editorial force and removed to Paris, where he assisted in editing the *Deutsch-Französische Jahrbücher*, and lived in

close association with the French Socialistic group, of which Proudhon was the leader. Here he became acquainted with Friedrich Engels, with whom he was associated throughout the remainder of his life. In 1845 he was expelled from Paris at the instance of the Prussian government and removed to Brussels, where he remained for three years, deeply engaged in economic study. One of the fruits of his labors here was his controversial work on Proudhon, the *Misère de la philosophie*, in which he criticizes his former associate unsparingly.

In 1847 Marx and Engels entered into relations with a revolutionary association in England known as the Communist League, which held a Congress in 1847 and issued a program composed by Marx and Engels, known as the Communist Manifesto. This document was published in most of the languages of Europe and became practically the creed of the Socialistic revolutionaries. It advocated the following measures: (1) Abolition of property in land and the application of all rents to public purposes; (2) a progressive income tax; (3) abolition of all rights of inheritance; (4) confiscation of all property of emigrants and rebels; (5) centralization of credit in the hands of the state by means of a national bank with state capital and an exclusive monopoly; (6) nationalization of means of communication and transportation; (7) extension of productive enterprises by the state, the reclamation of waste land and general improvement of the soil; (8) compulsory labor, with establishment of industrial armies especially for agriculture; (9) combination of agriculture with manufacturing, the elimination of distinction between town and country by more even distribution of the population; (10) free education in public schools and abolition of child labor in factories.

In 1848 Marx returned to Cologne and started the *Neue Rheinische Zeitung*, but because of his revolutionary activity he was ordered to leave Germany in May, 1849. He went to Paris, but later in the year was forced to leave that city and moved to London, which was henceforth his home. He became a newspaper correspondent, writing for the New York *Tribune*, *Putnam's Monthly*, and other papers, a number of his articles subsequently being published in pamphlet form. Among these are: "Der 18te Brumaire des Louis Bonaparte" (1852); "The Life of Palmerston" (1850); "Palmerston and Poland" (1853). In 1859 he published his *Kritik der politischen Oekonomie* (translated into English, 1904), which contained the essence of the principles elaborated in his subsequent work, *Das Kapital*.

In 1864 Marx at last found the opportunity of realizing a plan he had long contemplated—that of organizing the laborers of the civilized world into a great association. On September 28 there was a great meeting in St. Martin's Hall, to which Marx outlined his scheme of an "International Workingmen's Association" (q.v.). During these years Marx was also greatly interested in the developments in Germany and assisted Liebknecht and his associates in establishing the Social Democratic Labor party in 1869. In 1867 appeared the first volume of *Das Kapital* (English translation, 4th edition, from the 3d German edition, London, 1891). The second volume was completed by Engels and published in 1885; the third in 1895. The style is heavy, and the analysis detailed and difficult. Marx seeks to

discover the economic law that governs society. Modern social development is made possible only by capital; it has reached its highest point and must necessarily be followed by another system. Modern capitalism exploits the laborer by getting possession of the "surplus value" of his services, i.e., the amount produced by him over and above the amount of his wages, which are regulated by the "iron law" and tend therefore to a minimum. The basis of the exchange value of a commodity is the amount of labor expended on it. In the long run this means the average amount of labor expended under average conditions. Marx traces the historic development of capital and shows the tendency for the instruments of labor to concentrate in fewer and fewer hands. Thus arises the capitalistic class. Meantime develops also a class who have only their labor to sell, the proletariat. The growth of capitalism reduces the number of capitalists and increases the poverty and misery of the working classes, but also serves to bring them to self-consciousness. The proletariat will finally organize and the means of production will be seized and managed for the good of all. Marx outlined no ideal future condition. He tried to show what he believed to be the course of historical development and sought to bring about the next step, the organization of all laborers for their common good. Marx died in London, March 14, 1883.

MARY (Gk. *Μαρία*, *Mariam*, *Mapla*, *Maria*, from Heb. *Miryām*, of uncertain etymology), THE MOTHER OF JESUS. Apart from what is contained in the narratives of Jesus' birth and childhood (Matt. i-ii; Luke i-ii), very little is told of Mary in the New Testament. If the genealogy in Luke iii. 23-38 is intended to be that of Mary (which is doubtful), she was descended from David. She was also related to the priestly family to which Elizabeth, mother of John the Baptist, belonged. (See Luke i. 5, 36.) After her betrothal to Joseph, a carpenter of Nazareth in Galilee, but before her marriage, she was informed in an angelic vision that she would through miraculous conception give birth to a son who should reign on the Davidic throne and be called the Son of the Highest. (Luke i. 26-38.) The marriage to Joseph took place. Jesus, her first-born son, was born at Bethlehem, whither she had gone with Joseph in consequence of a census decreed by Augustus. (Luke ii. 1-6.) Compelled to flee into Egypt with the infant Jesus, Joseph and Mary returned to Nazareth after the death of Herod the Great. (Matt. ii. 13-23.) Here some have believed that other children, Jesus' brothers and sisters (cf. Mark vi. 3; Matt. xiii. 55), were born; though the belief in her perpetual virginity has been a part of traditional theology from early times. Soon after Jesus began his public ministry the family—Joseph was apparently dead—moved to

Capernaum. (John ii. 12; cf. Matt. iv. 13, ix. 1.) To what extent Mary accompanied Jesus on his journeys we do not know. That she did not fully comprehend the mission of her son is evident from John ii. 4, if not from Mark iii. 31-35. (Cf. Luke ii. 48-49.) She witnessed the crucifixion and was then intrusted by Jesus to the care of John, the beloved disciple, who gave her a place in his home. (John xix. 25-27.) The last notice of Mary in the New Testament is in Acts i. 14, where she is mentioned as one of the company of disciples who were accustomed to meet in the upper room in Jerusalem soon after the Resurrection.

No more than this is told of her in the New Testament; but the tradition of the Christian Church added much to it. There grew up a literature, partly apocryphal (see APOCRYPHA), dealing with her infancy and childhood, with her espousal to Joseph, and with the birth and infancy of Jesus, and with her death and assumption into heaven. The more her position in the scheme of redemption was meditated upon, the more important did she appear. The frequent controversies as to the nature of her son bore upon her own personality and history; thus the Council of Ephesus (431) really summed up its doctrine against Nestorius in calling Mary the "mother of God" (*θεοτόκος*). Festivals celebrated in her honor increased in number; among the older ones, some of which date back to the fifth century, are the Purification, February 2; Annunciation, March 25; Assumption, August 15; Nativity, September 8; and Conception, December 8. The devotion to her not simply as an historical memory, but as a living power, owing to the prevailing force of her intercession with her son, became so marked in course of time that it was one of the things against which the reformers of the sixteenth century strongly protested. It continued to develop, however, in the Roman Catholic church, and found expression, among many other ways, in the definition in 1854 of her conception as immaculate, or free from the taint of original sin, a doctrine suggested as early as Augustine, and long held by the Catholic church; and the prayer in which her intercession is invoked (see AVE MARIA) became second only to the Lord's Prayer in frequency of use. Many of the shrines erected in her honor, at places supposed to have been consecrated by apparitions of her presence, have become among the most celebrated pilgrimage places. On this aspect of the devotion, see the articles *LOURDES*; *EINSIEDELN*.

the Gospels, consult Resch, "Das Kindheitsevan-gelium," in Gebhardt and Harnack, *Texte und Untersuchungen* (Leipzig, 1897); Sir W. M. Ramsay, *Was Jesus Born in Bethlehem?* (London, 1898). See also ASSUMPTION OF THE VIRGIN MARY; IMMACULATE CONCEPTION; MADONNA; ROSARY.

MARY I (1516-58). Queen of England from 1553 to 1558. Mary was born at Greenwich, Feb. 18, 1516, and ultimately was the only surviving child of Henry VIII by Catharine of Aragon. Her education was carefully and severely planned, and she learned to converse readily in Latin, French, and Spanish, and knew Italian. When two years of age she was betrothed to the Dauphin of France, afterward to her cousin, Charles V, and finally a treaty was signed providing for her marriage to either Francis I or his second son, Henry. Numerous other proposals were made, but they were rendered futile by the rapid changes in England's foreign relations or by Mary's refusal of a Protestant, until in the end her accession as Queen left her at liberty to choose her own consort. She was twice in danger, owing to her religious convictions—during the period of the divorce of her mother and during the reign of her brother, Edward VI (q.v.). She was a loving child and refused to abandon her mother's cause when Henry VIII divorced Catharine. In the end she was persuaded by her friends with the greatest difficulty to submit to Henry's demands and sign a renunciation of the Pope's authority and her own legitimacy. As a result of her compliance she was received into half favor and given a place in the succession to the crown. During Edward's reign she held uncompromisingly to the old faith, at the cost of much annoyance and the danger of actual persecution. In 1553 she succeeded to the crown, her popularity greatly increased by the attempt of Northumberland to displace her with Lady Jane Grey (q.v.).

Mary began her reign firmly resolved to sweep away the religious innovations of her father and half brother. She proceeded throughout in a legal manner and never failed to secure the consent of Parliament to her acts, though during the Tudor period Parliament very imperfectly represented the sentiments of the English people. The mass was restored without opposition in 1553, and the authority of the Pope reestablished somewhat tardily and reluctantly in 1554. Mary could not persuade the Parliament to restore the Church lands, but she gave back such property as was still in the possession of the crown. This was a greater proof of her sincerity than of her statesmanship, for it impoverished her resources and led to subsequent disasters which touched English pride. Even more disastrous was her marriage in 1554 with Philip, son of Charles V, which was so unpopular that on its proposal a formidable rebellion broke out under the leadership of Wyatt to depose Mary and put Elizabeth on the throne. Philip, who was 11 years younger than Mary, was an uncompromising Catholic. He was extremely unpopular, and repaid Mary's boundless devotion with coldness and neglect. To please him the Queen joined in a war against France, with the result that Calais, the last remnant of the English conquests during the Hundred Years' War, was lost in 1558. It was no disaster of any consequence to England, but to Mary and her subjects it seemed irreparable. In addition to her husband's neglect, the loss of

Calais, and her own ill health, Mary's last days were darkened by the religious persecutions which filled the latter part of her reign, in which nearly 300 persons were burnt for their faith and for which she received the name of Bloody Mary. It should not be forgotten that she adopted these measures with reluctance, as a last resort, and that her predecessors and successors were guilty of like practices. She died without issue, Nov. 17, 1558. Consult: John Lingard, *History of England* (6th ed., London, 1854-55); J. M. Stone, *The History of Mary I, Queen of England* (ib., 1901); J. B. Mullinger, "Philip and Mary," in *Cambridge Modern History*, vol. ii (Cambridge, 1904), containing a bibliography; Martin Hume, *Two English Queens and Philip* (New York, 1908); J. A. Froude, *The Reign of Mary Tudor* (ib., 1910).

MARY II (1662-94). Queen of Great Britain. She was born at St. James's Palace, April 30, 1662, the eldest daughter of James II and Anne Hyde, who was a daughter of the Earl of Clarendon. At the age of 15 she was married to William, Prince of Orange. She joined her husband in England early in 1689 after the flight of her father. In the same year Parliament declared the crown of England vacant by the abdication of James, and conferred it upon William (III) and Mary. She died of smallpox Dec. 28, 1694. Consult: Gilbert Burnet, *Essay upon the Life of Queen Mary* (London, 1695); Doebner (ed.), *Memoirs and Letters of Mary II, Queen of England* (Leipzig, 1886); R. S. Rait, *Five Stuart Princesses* (New York, 1908); M. Morris, *Reign of William and Mary* (ib., 1910); E. and M. S. Grew, *The Court of William III* (Boston, 1910). See WILLIAM III.

MARY (1867-). Queen Consort of George V (q.v.) of England.

MARY, NATIVITY OF THE VIRGIN. See APOCRYPHA, *New Testament*.

MARY, OF BETHANY. See MARTHA AND MARY, OF BETHANY.

MARYBOROUGH, mā'ri-būr'ō. A seaport municipality of March Co., Queensland, Australia, on the Mary River, 180 miles north of Brisbane, with which it has railroad communication (Map: Queensland, H 8). Among its institutions are a college, a library, and St. Paul's Anglican Church. It is the port of a rich coal, gold, and copper mining and agricultural region; has sugar mills and refineries, iron foundries, breweries, tanyards, boot, shoe, and soap factories, saw mills, shipbuilding industries, active fisheries, and a considerable export trade in timber, sugar, and minerals. The wharves are available to vessels of 17½ feet draft. Pop., 1901, 10,159; 1912, 11,626.

MARYBOROUGH. A municipality of Talbot Co., Victoria, Australia, 112 miles north of Melbourne by rail (Map: Victoria, C 5). It has fine government buildings, botanical gardens, and parks. Its industries include agriculture and important quartz and alluvial gold mines. Pop., 1901, 5633; 1911, 5675.

MARYLAND, mēr'ī-land. One of the thirteen original States of the American Union. It occupies a middle position on the Atlantic coast between Pennsylvania and Virginia, being included between lat. 37° 53' and 39° 43' 26" N. and long. 75° 4' and 79° 33' W. It is bounded on the north by Pennsylvania, the boundary being Mason and Dixon's line, and by Delaware;

on the east by Delaware and the Atlantic Ocean; on the south and west by West Virginia and Virginia. It is separated from the two last-named States by the Potomac River, which is the boundary from its source in a small mountain stream to its mouth in a broad estuary entering the Chesapeake Bay. The outline of the State is extremely irregular, as the southern boundary is mainly a winding river, while, in addition to this, Chesapeake Bay divides the eastern half into two parts. The extreme length of the northern boundary is 205 miles, with a further extension of 35 miles where the State stretches eastward south of Delaware to the ocean. The extreme breadth from north to south, near the eastern shore of the Chesapeake, is 128 miles, while it is only about 2 miles across near Hancock. The total area is 12,210 square miles, of which 2319 square miles are water.

Topography. The surface of Maryland shows great diversity. It is usually divided, for purposes of classification, into three regions: the coastal plain, the piedmont plateau, and the Appalachian province. All are drained by the rivers flowing into the Chesapeake, excepting the northwest corner, which drains towards the Ohio, a narrow strip draining directly into the Atlantic, and a fragment at the extreme northeast draining into Christian Creek and the Delaware.

The coastal plain embraces that part of Maryland lying to the east of a line passing from Washington to Baltimore, Havre de Grace, and Wilmington. It includes more than half the land area of the State and is divided by Chesapeake Bay into what is commonly called the "eastern shore" and the "western shore" or southern Maryland. The eastern shore is low and level; only in the north does it reach 100 feet, and most of it is less than 25 feet above the sea. The western shore is higher and rises to 300 feet near the District of Columbia and again near Baltimore. Chesapeake Bay has many islands, and the entire Atlantic coast is made up of a long, reeflike, sandy island, inclosing the Chincoteague and Assateague bays. The eastern shore is drained by the Pocomoke, Nanticoke, Choptank, and Chester rivers and by some smaller streams. The western shore is drained in the most part by the Potomac, the Patuxent, the Patapsco, and the Gunpowder.

The most conspicuous feature of the coastal plain of Maryland is Chesapeake Bay, which has about two-thirds of its 200 miles of length within the State. It is from 10 to 40 miles wide, and its numerous estuaries cut the plain in every direction and reach to the eastern edge of the piedmont plateau. The bay is navigable for the largest ships, and its numerous arms furnish a large number of fine harbors. The large area of sheltered, shallow, inland water affords an excellent fishing ground and an opportunity for oyster gathering and oyster culture scarcely equaled elsewhere in the world.

The piedmont plateau extends from the edge of the Atlantic plain to the Catoclin Mountain, the first range of the Appalachian system. This region is about 40 miles wide. Most of the surface is broken and hilly, especially in its western part, ascending with complicated drainage systems to Parr's Ridge in Carroll County. Between Parr's Ridge and the Catoclin Mountain is the comparatively level Frederick valley, drained by the Monocacy River, flowing southward into the Potomac. Near the mouth of the

Monocacy, Sugar Loaf Mountain (1281 feet) rises abruptly from the plain. From the Catoclin Mountain to the west boundary of the State, the Appalachian region spreads a succession of valleys, separated by nearly parallel northeast and southwest mountain ranges and all draining into the Potomac. The Blue Ridge, 2400 feet high at Quirauk, near the Pennsylvania line, crosses the State to Weverton on the Potomac and is the eastern limit of the Great or Hagerstown valley. This valley is bounded on the west by the North Mountain, between which and Cumberland is the Alleghany Ridge, a complex chain of long, narrow, very level mountain ridges, separated by narrow valleys, beginning at an elevation of about 500 feet at the Potomac. Just west of Cumberland rises Dan's Mountain (2882 feet).

To the west of it is the Alleghany plateau, giving the elevation of 2000 feet or more to all of Maryland to the west, except the immediate valleys of the Potomac, Savage, and Youghiogheny rivers.

Much of the plateau is above 2500 feet, and the highest mountains, the Savage and its extension, the Backbone Mountain, exceed 3000 feet in elevation.

Climate. The climate of Maryland is one of transition in which the Northern severe winter gives way to the open Southern winter. The extreme temperatures of more Northern locations are occasionally met with, but the periods of cold are of less duration and the number of freezing days and the amount of snowfall are less. An extreme winter temperature of 26° below zero F. has been recorded at Sunnyside in the Alleghany plateau, and a summer temperature of 109° F. near Cumberland. Changes of temperature are frequent, and there is a great daily range. In north-central Maryland the average temperature for January is 30° F., that for July 75° F. The average annual temperature for the State is between 53° F. and 54° F. The average dates for first and last killing frosts in the plateau are October 1 and April 15; on the Marine Islands the growing season is a month longer, extending from April 1 to October 15.

The average rainfall for the State is 43 inches, of which 11.5 to 12 fall in spring and in summer and 9.5 to 10 in the fall and in winter. The effects of elevation and slope are clearly shown in the distribution of the rainfall. The western slope of the Alleghany plateau receives 53 inches; the eastern slope of Parr's Ridge over 45; the inclosed valleys between Cumberland and Hagerstown and small sections at the extreme east and southwest of the State, receive between 30 and 35. The Atlantic plain in the main receives from 42 to 48 inches. The snowfall averages 25.4 inches for the State, 16.6 for the southern and 43.4 for the western districts. The number of days of precipitation on the coast is 130, in the mountains 140. The relative humidity varies from 80 in the sea islands to 65 at the extreme west. The warm moist climate and light soil of the eastern shore cause that district to be the home of many Southern plants not found elsewhere in the same latitude.

Soil. Maryland has varied soils corresponding with the geological formations. The more recent formations of the Atlantic plain have light, sandy, and loamy soils, unsuited to grass, but especially adapted to vegetables, truck farming, small fruits, and peaches. Southern Mary-

land is an extensive producer of tobacco for the export trade. The region of metamorphic rocks and the limestone and shale valleys of the west are of heavier, often clay, soils, usually very fertile and adapted to wheat, maize, grass, and clover. On the western slope of the Blue Ridge Mountains, the Cambrian (Harper's) shale, crossing the State from Harper's Ferry north-eastward, produces a strip of sandy, shaly soil with exceptional adaptation to peaches, which are here a highly specialized crop. Similar shaly soils are on the flanks of all the ranges, and the valley floors are usually limestone.

Geology. Maryland presents a great variety of geologic formations, owing to the fact that it presents what is virtually a cross section from the Ohio valley to the Atlantic Ocean. That is, the various outcrops which run in broad bands parallel with the Atlantic coast are here so narrow that the whole series is encompassed by the State, from the coastal-plain formations to the western coal fields, while farther south they widen out so that even the State of North Carolina does not include them all. The entire portion of the State east of Chesapeake Bay and a strip from 5 to 20 miles wide along its west shore are covered with relatively recent and for the most part unindurated formations, consisting of Tertiary and Quaternary sands and clays east of the bay, and Cretaceous, Eocene, and Miocene on the west shore. West of this follows the Archean belt of the piedmont plateau. It is here about 50 miles broad, occupying the whole central part of the State, but in early Mesozoic time this Archean land was divided into two parts by a narrow arm of the sea which ran southwestward from the present mouth of the Hudson, and whose bed is now filled with a deep layer of Triassic sandstones and shales and accompanying dikes of diabase occupying the Frederick valley. The narrow western part of the State is traversed by the various outcrops brought to the surface by the Appalachian folding and subsequent denudation. They are largely Devonian, which is of great thickness, but include also all of the older Paleozoic periods—Cambrian, Ordovician, and Silurian. From the vicinity of Cumberland to the west boundary of the State the various formations of the Carboniferous and Permian are exposed, forming a part of the great Appalachian coal field. The Maryland coals occur in five basins, of which the Georges Creek and upper Potomac basins are most largely worked. In addition to the foregoing there are intrusions of eruptive rocks running in a chain of dikes east of the Blue Ridge. During the Pliocene and Pleistocene periods the eastern part of the State was subjected to repeated changes of level, resulting in a series of four sea-formed terraces, the oldest lying at the highest level and the successively younger imbricating around the preceding. The latest has been but slightly dissected by erosion, whose effects are more pronounced on the older and higher terraces. The latest movement of the land was downward, resulting in a partial submergence of the lower courses of the coastal-plain rivers—Chesapeake Bay and its broad and winding estuaries being, in fact, a drowned river valley with its tributary streams converted into estuaries.

Mining. The principal mineral product is coal, which represents over one-half of the total mineral value produced. Deposits are confined to Allegany and Garrett counties, with the

greater part coming from the Georges Creek basin in the former. Coal mining was started in the early part of the nineteenth century, the product being shipped by barges on the Potomac River. The coal of the Georges Creek basin is of high repute as a steam and blacksmith's fuel, but has poor coking qualities. The output in 1913 was 4,779,839 short tons, valued at \$5,927,046. Mechanical methods of mining coal have made little progress in Maryland mines, as practically 95 per cent of the total production is mined by hand. In 1912 there were 6162 men employed in the coal mines.

Next to coal, the most important industries are clay working and stone quarrying. The clays are widely distributed and are suitable for a variety of uses. The fire bricks manufactured from that of the western part are considered among the best in the United States. The value of the clay products in 1913 was \$1,917,500. The principal quarry product is granite. A white marble extensively used for structural purposes is also produced in Baltimore County. Limestone is quarried in considerable quantities in the western part of the State. Maryland is one of the most important slate-producing States. Slate is all quarried in the so-called Peach Bottom district near Cardiff, Harford County. The product is a black slate well known in the markets all over the world and is used almost entirely for roofing. Lime is produced in considerable quantities. The product in 1913 was 108,883 short tons, valued at \$357,392. The value of the sand and gravel produced in 1913 was \$622,567. The other commercial mineral products are cement, copper, feldspar, infusorial earth, iron ore, mineral paints, mineral waters, quartz, sand-lime brick, tale, soapstone, and a small quantity of silver. The total value of the mineral products in 1913 was \$11,292,723.

Agriculture. Of an approximate land area in 1910 of 6,362,240 acres, 5,057,140 were in farms, of which there were 48,923. The improved land in farms in 1910 was 3,354,767 acres. The average acres per farm was 103.4 in 1910. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$286,167,028 in 1910. The average value of land per acre was \$32.32 in 1910. Of the total number of all farms in 1910, 14,416 were operated by tenants. The acreage of farms owned by white farmers in 1910 was 2,783,279; that owned by colored farmers was 122,039. The acreage leased by white farmers was 1,721,414; that leased by colored farmers was 223,117. The native white farm operators in 1910 numbered 40,669, the foreign-born white farmers 1882, and the negro and other nonwhite farmers 6372.

The following is a table of crops, showing acreage, value, and production as estimated by the United States Department of Agriculture.

PRODUCTS	Acreage	Prod. bu.	Value
Corn.....	663,000	24,531,000	\$16,681,000
Wheat.....	612,000	13,158,000	13,947,000
Oats.....	43,000	1,161,000	604,000
Potatoes.....	44,000	3,432,000	2,059,000
Hay.....	390,000	*448,000	6,854,000
Tobacco.....	*22,000	†17,600	1,408,000
Rye.....	25,000	425,000	366,000

* Tons.

† Pounds.

The total value of crops in 1909 was \$43,920,000. The general character of agriculture is indicated by the fact that about half of the total value of the crops in 1909 was contributed by cereals, about one-sixth by potatoes and other vegetables, and more than one-eighth by hay and forage. The remainder consisted chiefly of forest products, fruits and nuts, tobacco, small fruits, and flowers, plants, and nursery products. The leading crops in the order of their importance are corn, wheat, hay and forage, potatoes, and tobacco.

The total acreage of potatoes and other vegetables in 1909 was 155,339 and their value \$7,996,105. Excluding potatoes and sweet potatoes and yams, the acreage of vegetables was 108,084 and their value \$5,729,000. The growing and canning of orchard fruits is of importance. The total production of the orchard fruits in 1909 was 2,577,359 bushels, valued at \$1,517,400. Of these, apples were by far the most important. Other important orchard fruits were peaches and nectarines, pears, cherries, plums, and prunes. Figs are the only tropical fruit grown in any quantity. Of small fruits the most important is the strawberry, of which 23,611,095 quarts, valued at \$1,070,072, were grown in 1909. The total production of small fruits in that year was 26,277,054 quarts, valued at \$1,227,548.

A small amount of sugar beets are grown, and these are used entirely as root forage. There were grown, in 1909, 275 tons of sorghum cane, from which 1782 gallons of sirup were made.

Live Stock and Dairy Products. The total value of the domestic animals of the State in 1909 was \$30,649,961. On Jan. 1, 1915, the estimated numbers and value of live stock were as follows: cattle, other than milch cows, 121,000, valued at \$3,570,000; milch cows, 177,000, valued at \$9,558,000; horses, 167,000, valued at \$18,871,000; mules, 25,000, valued at \$3,450,000; sheep, 223,000, valued at \$1,160,000; swine, 349,000, valued at \$3,385,000. The poultry of all kinds on the farms in 1910 were valued at \$1,858,570. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$5,480,900. This included 8,739,720 pounds of butter. There were 19,424,325 gallons of milk sold.

Fisheries. In 1890 the value of the fishery products was \$6,460,759, while in 1908, the latest year for which complete statistics are available, it had fallen to \$3,306,910. More persons are engaged in the industry than in any other State. The oyster is the most important product of the fisheries, amounting to almost 75 per cent of the entire output. In 1908, 5,830,200 bushels of oysters, valued at \$2,127,140, were taken for market purposes and 401,800 bushels, valued at \$101,190, for seeding purposes. The rivers flowing into Chesapeake Bay contribute largely to the fisheries products, particularly shad. There were taken, in 1908, 3,936,800 pounds of this fish, with a value of \$246,590. Soft crabs were taken to the amount of 7,587,300 pounds, valued at \$195,000, and hard crabs to the amount of 12,785,900 pounds, valued at \$124,350. Among other important products are alewives, striped bass, menhaden, white perch, yellow perch, sturgeon, catfish, and terrapin. There were engaged in the fisheries, in 1908, 8444 fishermen. There were 1107 vessels engaged in fishing, and these were valued at \$821,141.

Manufactures. Maryland has been an important manufacturing State from its first settlement. The value of its products per capita increased from \$57 in 1849 to \$244 in 1909, when it ranked fifteenth among the States, when measured by the value of its products. The table on the following page gives the more important figures relative to the 10 leading industries, as gauged by value of products, for 1909 and 1904.

As will be noted from the table, the manufacture of clothing is by far the most important industry. In 1909 Maryland ranked fourth among the States in the production of men's clothing and eighth in the production of women's clothing. The canning and preserving of fruits, vegetables, fish, and oysters and the manufacture of pickles, preserves, and sauces is an important industry. This industry, whose chief characteristic is its extremely seasonal character, attained commercial recognition in 1850, and Maryland became its chief centre. Considering the short season during which it is active, the value of its products, compared with other industries, is very large. The total value of vegetables canned in 1909 was \$10,779,540. The lumber and timber industry has more establishments than any other. The making of fertilizers is also of great importance. This industry began about 1832, when the demand for a commercial fertilizer arose on account of the increase in tobacco culture and various other forms of agriculture. Bone was the first crushed fertilizer, but subsequently crushed bone was mixed with phosphate rock from South Carolina, guano from the West Indies, and potash salts from Germany. The quantity of all kinds of fertilizers produced in 1909 was 608,699 tons. The manufacture of cotton goods, including cotton small wares, is one of the oldest industries. In 1909 there were 16 establishments, the value of whose products was \$5,522,000. The manufacture of iron and steel products, chiefly pig iron, is of considerable importance, although on the decline. There are iron deposits, but the ore is of a grade that does not compare favorably with other ore, and most of it is imported. There were produced, in 1912, 219,546 long tons of pig iron. In the early history of the State shipbuilding was one of its most important industries. The "Baltimore clippers" were famous all over the world and were instrumental in greatly extending the commerce of the State. The substitution of iron and steel for wood in shipbuilding resulted in the decline of the industry. It is still of considerable importance, however, and many vessels for the United States government are constructed in the shipyards of the State. There were launched, in 1909, 129 vessels of all kinds, with a gross tonnage of 34,160. Of these, nine were iron and steel vessels.

The average number of wage earners engaged in the manufacturing industries in 1909 was 107,921; 75,573 were males and 32,348 were females. The wage earners under 16 years of age numbered 6548, of whom 3157 were males. Almost three-fourths of the total number of wage earners in 1909 were in establishments where the prevailing hours of labor per week ranged from 54 to 60, or from 9 to 10 a day, and of these over one-half were employed 60 hours a week. By far the most important city is Baltimore. There were in this city, in 1909, 71,444 wage earners, and the value of the product of its

manufactures was \$186,977,710. In the value of manufactured products Baltimore was thirteenth among the cities of the United States in 1909. The men's clothing industry is practically confined to Baltimore.

Forest Products. Although much of the merchantable timber has been cut away, there are still large quantities of timber standing. The use of the lumber for the manufacture of paper and pulp has shown a large increase in recent years. In 1909 there were cut 267,939 M feet of rough lumber and there were manufactured 17,583 thousands of lath and 12,352 thousands of shingles. The principal varieties of lumber sawed in 1910 were yellow pine, oak, and chest-

River is navigable to Washington. The Chesapeake and Ohio Canal, in the early part of the nineteenth century a great highway of commerce, now carries chiefly coal. Baltimore is the commercial centre of the State. There were, in 1914, 18 companies operating electric railways, and these had 940 miles of single track in the State.

Banking. The first bank in the State was the Bank of Maryland, chartered in 1790. In the early thirties there were half a dozen banks in Baltimore which suffered with all the other banks of the country from the money panic of 1837. Six or seven banks failed, among them the Bank of Maryland, seriously affecting the

COMPARATIVE SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
Expressed in thousands								
All industries	1909	4,837	125,489	107,921	\$251,227	\$45,436	\$315,669	\$116,620
	1904	3,852	107,303	94,174	201,878	36,144	243,376	93,352

nut. There were also forest products to the value of \$2,349,045 cut or produced on the farms. This includes firewood, charcoal, fencing material, logs, railroad ties, telegraph and telephone poles, materials for barrels, tanbark, etc.

Transportation. Maryland is traversed by the main lines of two important railroad systems. The Baltimore and Ohio Railroad was one of the first important lines operating in the United States. The total railway mileage on June 30, 1914, was 1401 miles of single-track road. The Baltimore and Ohio, with 336 miles, had the longest mileage; the Philadelphia, Baltimore, and Washington had 329; the Western Maryland 272; the Baltimore, Chesapeake, and Atlantic 88; and the Northern Central 77. The Baltimore and Chesapeake Canal connects the head of Chesapeake Bay with the Delaware River. Chesapeake Bay gives excellent facilities for water transportation, and the Potomac

commercial interests of the State. In 1850 there were 27 banks, with a capital of \$9,310,407. On Sept. 12, 1914, there were 101 national banks, with capital \$16,009,710, surplus \$11,761,710, cash \$5,091,791, loans \$95,354,675, and deposits \$91,912,716. There were on June 30, 1914, 62 State banks with capital \$2,997,945, surplus \$1,673,455, cash \$1,017,106, loans and discounts \$20,006,159, and deposits \$24,945,808; and 52 savings banks (mutual and stock) with 289,585 depositors and deposits to the amount of \$109,663,347.

Government. The State has been governed under constitutions of 1776, 1851, 1864, and 1867. Amendments may be proposed by the General Assembly and must be passed by three-fifths of all the members of the two Houses. The amendment is then submitted to the qualified voters. When two or more amendments are submitted, they shall be so submitted that each

amendment shall be voted on separately. Every 20 years dating from 1887 the question of calling a constitutional convention for altering the constitution is laid before the people.

Legislative.—The Legislature consists of two branches, a Senate and a House of Delegates. Each county and each of the four legislative districts of Baltimore City is entitled to one Senator, who serves for four years. Each county is entitled to delegates in proportion to its population, ranging proportionately from two delegates for every county having 18,000 inhabitants or less to six delegates for each county having 55,000 or more. Each of the four legislative districts of Baltimore is entitled to the number of delegates to which the largest county is entitled. An unusual provision of the constitution prevents clergymen of any creed or denomination from serving as Senator or delegate. The General Assembly meets every second year on the first Wednesday of January, dating from 1868. Sessions are limited to 90 days. When the General Assembly is convened by proclamation of the Governor, the session shall not continue longer than 30 days. The House of Delegates has the sole power of impeachment, and all impeachments are tried by the Senate.

Executive.—The executive power is vested in the Governor, who holds office for four years. He must have attained the age of 30 years, have been a citizen of the State for 10 years, and for five years next preceding his election a resident of the State. The Governor has the veto power, but bills carrying his veto may be passed by a three-fifths majority of the members of both Houses. The Governor has power to disapprove of any item or items of any bills making appropriations of money embracing distinct items.

Judiciary.—The judicial power is vested in a court of appeals, circuit courts, orphans' courts, and justices of the peace. The judges of all courts are elected in the counties by the qualified voters in their respective judicial circuits. Each of the judges holds office for a term of 15 years or until he shall have attained the age of 70 years. The court of appeals is composed of the chief judges of the first seven of the several judicial circuits and a judge from the city of Baltimore specially elected thereto. One of these is appointed chief judge by the Governor. The State is divided into eight judicial circuits, the city of Baltimore constituting the eighth. For each of these circuits there is a chief judge and two associate judges, styled Judges of the Circuit Court. In the city of Baltimore are six courts: the Supreme Bench of Baltimore City, the Superior Court of Baltimore City, the Court of Common Pleas, the Baltimore City Court, the Circuit Court of Baltimore City, and the Criminal Court of Baltimore. The orphans' courts are composed of three men for each county, elected for a term of four years.

Suffrage and Elections.—Every male citizen of the United States of the age of 21 years and upwards, who has been a resident of the State for one year and of the legislative district or county in which he may offer to vote for six months next preceding the election, is entitled to vote. Persons convicted of bribery or other crimes against the electorate are forever disqualified from voting thereafter. Elections for Governor are held on the Tuesday next after the first Monday of November every four years, dating from 1867. There is a primary-election law, which was enacted in 1912. All parties

must nominate candidates, including judges and members of the national House of Representatives, by primary elections. The nomination of candidates by direct vote does not apply to the nomination of such candidates for county offices, State Senate, and members of the House of Delegates in the counties of Howard, Washington, and Worcester. Provision is also made by the act for presidential primaries.

All candidates for offices must be nominated, selected, or chosen by the direct vote of the duly registered voters belonging to the political parties. In case there are more than two candidates for any State office, there is provided on the ballot opportunity for voters to indicate first or second choice respectively. There is a corrupt-practices act, which compels a strict accounting for political funds and limits the expenditures. By provisions of this act candidates' expenditures are limited to \$10 per thousand registered voters up to 50,000 and \$5 per thousand above 50,000. An unusual provision is that any promise made by the wife of a candidate is to be considered as coming from the candidate himself. United States Senators are nominated under a special senatorial primary-election law enacted in 1908. The Legislature of 1914 amended this law so as to conform with the provisions of the Seventeenth Amendment to the Constitution.

Local and Municipal Government.—The General Assembly has power to organize new counties, but no such county must be formed without the consent of the majority of the legal voters residing within the limits proposed to be formed into the new county; and no new county must contain less than 400 square miles or less than 10,000 white inhabitants, nor must any change be made within the limits of any county whereby the population of said county would be reduced to less than 10,000 white inhabitants or its territory be reduced to less than 400 square miles. Each county has a county commissioner elected for a term not exceeding six years. A sheriff and a surveyor are also elected for each county. Other county officials are coroners, elisors, and notaries public. Towns and cities may adopt a commission form of government. The only city which had adopted this form at the end of 1913 was Cumberland.

Other Constitutional and Statutory Provisions.—A married woman may acquire, hold, and manage property independently of her husband and dispose of the same as if single. The husband must join, however, in the execution of any deed. Debtors are protected in the possession of property to the value of \$500. Professional Christian Science healers come within the statutory regulations concerning practitioners of medicine. The white-slave traffic is regulated by severe provisions. There is a workmen's compensation law and provisions regulating the employment of children. The State has no general local-option law, but a number of counties have been permitted to vote on the liquor question by virtue of special acts passed by the Legislature. A bill extending local option in regard to the sale of intoxicating liquor to counties not prohibiting such sale was passed by the House of Delegates in 1912, but was defeated by the Senate.

Finance. Maryland led in the movement for internal improvements which began in the early twenties of the nineteenth century, and its first public debt was created in order to acquire 5000

shares of the Chesapeake and Ohio Canal. In 1836 bonds to the amount of \$8,000,000 were authorized to be invested in various improvements, chiefly canals and the Baltimore and Ohio Railroad, and by 1839 the public debt amounted to more than \$16,000,000. A financial collapse resulted in the following year when the State stopped payments of interest. In 1841 very heavy taxes were imposed, which were almost impossible to collect, and a repudiation of the State's debts was threatened. The arrears of interest were finally funded in 1844, and on Jan. 1, 1848, payment of interest on the State debt was resumed. During the Civil War there was a considerable debt incurred for defense, bounties, etc., but it has been defrayed, and the debt now consists almost entirely of bonds sold to defray the cost of new public buildings. On Sept. 30, 1914, the bonded debt amounted to \$19,685,880. Of these bonds the largest issue, amounting to \$3,191,095, is a refunding series known as the consolidated loan of 1899. All the remaining bonds were issued at different times between 1900 and 1914 either for public buildings or for public roads and highways. In 1914 there was raised a loan of \$817,880 for the purpose of refunding the consolidated loan of 1899, due Jan. 1, 1914. The sinking fund of this loan held securities and cash aggregating \$3,209,230, or more than sufficient to retire it; but rather than sell the securities at a loss the Treasury officials decided to hold the securities and refund for the amount less the holdings of its own stocks. On Sept. 30, 1914, there was a balance in the Treasury of \$1,840,256. The gross receipts for the fiscal year 1914 amounted to \$12,600,566. The disbursements aggregated \$12,999,561. The State has no floating debt.

Militia. According to the Thirteenth Census there were 271,373 men of militia age. The organized militia on June 31, 1914, consisted of 157 officers and 1986 enlisted men.

Population. The growth of the population is shown by the following figures: 1790, 319,728; 1850, 583,034; 1870, 780,894; 1900, 1,188,044; 1910, 1,295,346. Population on July 1, 1914, was 1,341,075; 1920, 1,449,661. By color the population in 1910 numbered 1,062,639 whites and 232,250 negroes. There is a small foreign population. The native whites of foreign or mixed parentage in 1910 numbered 191,838 and the foreign-born whites 104,174. Of the latter the largest numbers came from Germany and Russia. The urban population, i.e., in places of 2500 or more, in 1910 was 658,192. The rural population in 1910 numbered 637,154. The density per square mile in 1910 was 130.3. By sex the population was divided in 1909 into 644,225 males and 651,121 females. The males of voting age numbered 367,908. The largest city in the State is Baltimore (q.v.), with a population in 1910 of 558,485. The other large cities of the State, with their populations in 1910, are as follows: Cumberland, 21,839; Hagerstown, 16,507; Frederick, 10,411; Annapolis, 8609.

Education. Maryland has the same problems which hamper the development of education in the more Southern States. These include a negro and a preponderant rural population. Conditions have greatly improved as a result of wise measures passed by the Legislature and the intelligent supervision by the State Department of Education. In 1910, of a total population of 10 years of age and over of 1,023,950, there were 73,397 illiterates, or 7.2 per cent of the popula-

tion. That conditions are improving is shown by the fact that the percentage in 1900 was 11.1 per cent. According to the Thirteenth Census the total number of children from 5 to 20 years of age in the State in 1910 was 415,905. Of these, 230,123 attended school. The report of the State Superintendent of Education shows a total population between 5 and 20 years, on July 31, 1913, of 415,908. The number of different pupils enrolled in 1913 was 237,835, and the average daily attendance was 115,007. In the colored schools there were, in 1913, 43,757, and the average daily attendance was 26,167. The total number of schools in 1913 was 2469, and there were 5805 teachers, of whom 4899 were females and 906 were males. The average yearly salary of teachers was \$537.59. The total value of school property in 1913 was \$10,672,069. Schools for colored children numbered 540, with 905 teachers, of whom 667 were females and 238 were males.

The educational system is administered by a State Board of Education with a State Superintendent as its executive officer. The Legislature of 1902 passed a compulsory education bill, but this applied only to Baltimore City and Allegany County. The Legislature of 1912 passed a compulsory school law, the adoption and enforcement of which is left to the school boards of the several counties, excepting five counties, whose representatives in the General Assembly had exempted their counties. Up to 1914 five county school boards had approved the law and were enforcing its provisions, with the result that there had been an increase of from 10 to 15 per cent in school attendance. The General Assembly of 1910 passed a high-school law, which made possible excellent results along the lines of secondary education. Approved high schools of the first group, which must have an enrollment of not less than 80 students, four grade and two special teachers, receive an appropriation from the State of \$2300. A second-group high school, which may have a three years' course, two grade and one special teacher, and whose enrollment must be not less than 35 students, receives a State appropriation of \$1400.

The total expenditure for public schools in 1913 was \$5,326,876. The Legislature of 1914 passed a number of unusually important laws relating to education. Among these were measures providing for the consolidation of schools and the establishment of a State university. There has been a teachers' pension law since 1902. The normal schools are the Maryland State Normal School at Baltimore, Frostburg State Normal School at Frostburg, and the Maryland Normal and Industrial School for Colored Students at Bowie. The institutions of higher education in the State include Johns Hopkins University (q.v.) at Baltimore, which offers a summer course for teachers, Western Maryland College at Westminster, Washington College at Chestertown, St. John's College at Annapolis, Maryland Agricultural College at College Park, and Blue Ridge College at New Windsor. These institutions all receive State aid. In addition there are Goucher College and Hood College in Baltimore, Woman's College at Frederick, and the Maryland College for Women at Lutherville. Under the auspices of the Roman Catholic church are Loyola College at Baltimore, Mount St. Joseph's College at Baltimore, Rock Hill College at Ellicott City, and Mount St. Mary's College at Emmitsburg. Morgan

College at Baltimore is a coeducational institution for colored students. The Jacob Tome Institute, an endowed secondary school, is at Port Deposit. The United States Naval Academy, a government institution to train young men to serve as officers in the United States navy, is located at Annapolis.

Charities and Corrections. Charities and corrections are in charge of the Board of State Aids and Charities. The correctional institutions include St. Mary's Industrial School at Baltimore, Industrial Home for Colored Girls at Melyale, the House of the Good Shepherd (colored) at Baltimore, Maryland School for Girls at Loch Raven, the House of Reformation for Colored Boys at Cheltenham, and the Maryland Industrial School for Girls at Baltimore. There are in addition many homes and asylums for children and adults, especially in Baltimore. There are 23 general hospitals, 7 hospitals for the insane, and 9 special hospitals. In addition there are a number of educational institutions which come under the jurisdiction of the board. These include 10 boarding schools for general educational purposes, St. Francis Xavier's School for the Deaf at Irvington, Maryland School for the Blind at Overlea, and Maryland School for the Deaf at Frederick. The total appropriations for the support of the State institutions in 1913 amounted to \$1,136,118. The State Penitentiary is in Baltimore. The convicts are generally employed under contract, the majority being engaged in the manufacture of boots and shoes. The prisoners confined in jails do not as a rule have employment. About half the prisoners are negroes.

Religion. The Roman Catholic and Methodist churches far surpass all others in Church communicants. Of the other denominations the strongest are the Protestant Episcopal, Lutheran, Baptist, and Presbyterian.

History. In 1632 Cecilius Calvert, second Lord Baltimore, received from Charles I a charter conferring on him the possession of the territory now forming the States of Maryland and Delaware. The grant had been obtained by George Calvert, first Lord Baltimore, the father of Cecil, but he died before the charter was issued. It was the intention of the Lord Proprietor to found a feudal State in Maryland (named in honor of Charles's Queen, Henrietta Maria), and to that end he was invested with sovereign powers, subject only to the recognition of the King as lord paramount by the payment of a yearly tribute of two Indian arrows. One of the chief causes that led to the settlement of Maryland was the desire of Lord Baltimore, a Catholic, to found a colony where his fellow believers might profess their religion openly without incurring the penalties to which they were subjected in England. Other denominations, however, in the Proprietor's scheme, were to be on an equal footing with the Catholics, and of the 20 gentlemen and 200 or 300 commoners who arrived at Point Comfort, Va., in February, 1634, under the leadership of Leonard Calvert, it is probable that more than half were Protestants. On the twenty-fifth of March mass was celebrated on St. Clement's Island in the Potomac, and shortly after the site of the city of St. Mary's was traced on land bought from the Yaocomico Indians, near the banks of the river.

In his use of the vast powers granted him by the King, Baltimore was as moderate as in the expression of his religious views, and he made

no attempt to establish anything like an absolute government. By the terms of the charter, laws for the province could be made by the Proprietor only, with the consent of the freemen or their deputies, and on Jan. 26, 1635, the first assembly of freemen met at St. Mary's. The right of initiating laws, claimed both by the Assembly and by the Proprietor, was conceded in 1638 to the people, Baltimore reserving to himself the mere veto power. The first "statutes of the province" were passed in 1638 and 1639. With the Indians friendly relations were established. The worst enemy of Lord Baltimore's colony was William Claiborne (q.v.), a Virginian, who had established a trading post on Kent Island in Chesapeake Bay in 1631. He refused to recognize the authority of Lord Baltimore, and in 1638 his settlement was captured by Leonard Calvert during Claiborne's absence in England. In 1643 a company of Puritans, excluded from Virginia for nonconformity, settled at Providence, now Annapolis, and put themselves in opposition to the government. The outbreak of the Civil War in England enabled Baltimore's enemies to carry their opposition to a great length. In 1645 Capt. Richard Ingle, acting ostensibly in the name of Parliament, seized St. Mary's. Claiborne also returned from England, regained possession of Kent Island, and the Governor attempted in vain to dispossess him. For nearly two years Ingle held the province under his sway until Gov. Leonard Calvert returned from Virginia with a military force and recovered possession. As early as 1638 the molestation of Protestants had been punished. In 1649 an Act was passed at the desire of the Proprietor guaranteeing freedom of worship to all followers of Jesus Christ. The Puritans continuing to be turbulent, their settlement, by way of conciliation, was in 1650 erected into a separate county, named Anne Arundel, and as other Puritans arrived from England, Charles County was shortly afterward organized for their benefit. Their numbers increased to such an extent that they soon had a majority in the Assembly. In 1652 commissioners from England visited Maryland, among whom were Claiborne and Bennett, the Puritan leader of Anne Arundel County. The authority of the English Commonwealth was completely established in the colony, and Kent Island was given up to Claiborne. A commission for the government of the colony was organized with Capt. William Fuller at its head. The Puritans made use of their ascendancy to repeal the Toleration Act of 1649 and to enact penal laws against the Catholics. A severe conflict ensued. Providence was attacked March 25, 1655, by the proprietary party; but the assault was repulsed, the whole invading force being either killed or taken prisoners. In 1654 Lord Baltimore made a vain attempt to regain possession of the province, but succeeded only in defeating a scheme for uniting Maryland to Virginia. Three years later his title was recognized by the Protector, and in 1658 the proprietary government was restored. The period before the revolution of 1688 was marked by an important treaty with the Susquehanna Indians (1661) and some difficulties with William Penn concerning the boundary line between the two provinces in the Delaware country. Upon the deposition of James II, the incompetency of the Governor, the failure to proclaim the new monarchs, and preposterous rumors of a Popish plot stirred up the people, and an As-

sociation of the Protestant Freemen headed by Capt. John Coode seized the province in the name of William and Mary. The Legislature laid before the King a list of complaints against the government of Lord Baltimore, and in August, 1691, the Proprietor was deprived of his political privileges, though his property rights were left intact. In 1715, however, the province was restored to the fifth Lord Baltimore, a Protestant. At the beginning of the eighteenth century tobacco was the staple product. Commerce and manufactures were greatly restricted by the Navigation Acts. There were very few towns, Baltimore being founded as late as 1729, Frederick in 1745, and Georgetown in 1751. Prosperity was widely diffused, and the standard of living, owing to the abundance of game and fish, high. All sects were tolerated, except the Catholics, who were denied the suffrage and forbidden to worship in public. The Anglican church was established in 1692. Four years later a free high school was opened at Annapolis. The question of the north boundary, which after 1730 threatened to bring on war with Pennsylvania, was settled by the drawing of the famous Mason and Dixon's line (1763-67).

Maryland took an active part in the wars resulting in the extinction of the French domination upon the continent, and in the last and most important of these its western border suffered severely from Indian attacks, owing to the obstinacy of the Legislature in refusing to vote means for defense. The colony was also among the first to oppose the aggressions of the British government, which led to the War of the Revolution. The Stamp Act was received with great indignation, and the imposition of duties on tea was responded to by the burning of a tea ship (1774). In the same year a popular convention began to direct the revolutionary movement. It gradually assumed charge of the government. A bill of rights and a constitution were adopted in November, 1776, and the Legislature assembled at Annapolis, Feb. 5, 1777. Maryland took a most efficient and honorable part in the Revolutionary War, though it did not join the Confederation till 1781, owing to her claim that the western lands should belong to the Union. In 1783 Congress met at Annapolis, and here, on December 23, after the conclusion of peace, Washington resigned his commission as general in chief. The Federal Constitution was adopted in the Maryland convention April 28, 1788, by a vote of 63 to 11. Maryland suffered considerably in the War of 1812. (See UNITED STATES.) The beginning of the war was marked by a fierce riot against a Federalist newspaper of Baltimore, in which a number of people were killed. Havre de Grace and other villages were burned by the English fleet in 1813, Baltimore was unsuccessfully attacked by a British army, and Fort Mchenry was bombarded in September, 1814. This battle was the occasion for the writing of "The Star Spangled Banner" by Francis Scott Key (q.v.). An elaborate system of internal improvements was initiated in 1828, when the Chesapeake and Ohio Canal and the Baltimore and Ohio Railroad were begun. (See *Finance*.) In 1844 the first line of electric telegraph in the United States was run from Baltimore to Washington. The position of Maryland in the Civil War was peculiar. As a slaveholding State her sympathies were naturally to a great extent with the South, but her proximity to Pennsylvania made her truly a Border State. Many of

her people favored secession, a large number entered the Confederate army, and in the first days of the war the passage of Union troops through Baltimore was opposed, several Massachusetts soldiers being killed on April 19, 1861; but the strength of the Union party, added to the efforts of the Governor, served to keep the State from seceding. Later, bitter feelings were aroused by the policy of the general government in establishing military rule and suspending the habeas corpus in a large part of the State. The adherence of Maryland to the Union was extremely important in that it saved Washington from falling into the power of the Confederates.

Railroad development was facilitated by a system of State and county aid. For many years the claims of the State against the Baltimore and Ohio Railroad for the recovery of the subsidy granted the company in 1836 were fought in the courts without definite result. The Chesapeake and Ohio Canal was constructed as far as Cumberland and was profitable for some years, but diversion of traffic and danger from storms made it bankrupt. In 1865 the educational system, antiquated and inefficient, was reformed. The prevalence of corruption in city elections led to a revision of the election laws in 1889 and the adoption of the Australian ballot in 1890. In 1896 the bipartisan system of election boards was fully recognized.

The constitution of 1776 was often amended, especially in 1802, when the property qualification for the suffrage was abolished, and in 1837 the election of the Governor was given to the people. New constitutions were adopted in 1851, 1864, and 1867, the second of which abolished slavery. Its electoral vote has been as follows: 1796, Adams, 7, Jefferson 4; 1800, Adams 5, Jefferson 5; 1804, Pinckney 2, Jefferson 9; 1808, Pinckney 2, Madison 9; 1812, Clinton 5, Madison 6; 1816, Monroe 8; 1820, Monroe 11; 1824, Jackson 7, Adams 3, Crawford 1; 1828, Adams 6, Jackson 5; 1832, Clay 5, Jackson 3. It went Whig from 1836 to 1848, Democratic in 1852, American party (Know-Nothing) in 1856, and Democratic in 1860. In 1864 it voted for Lincoln, but from 1868 to 1892 was Democratic. In 1896, 1900, 1904, and 1912 it went Republican.

In 1907 John Walter Smith, Democrat, was nominated for Senator by votes cast for the first time directly by the people. The primary was, however, limited to the Democratic party. In the election for State officers held in November of that year Austin L. Crothers, Democrat, was elected Governor.

The presidential election of 1908 resulted in a division of the electoral vote. Bryan received six and Taft two, although the highest Taft elector received 116,593 votes compared with 115,910 votes for the highest Bryan elector. This situation was brought about by the large number of ignorant voters who were unable to read the names on the ballots.

In 1909 and again in 1910 persistent efforts were made to disfranchise the negro vote; these failed largely through the efforts of Governor Crothers. Statutes passed by the State Legislature made the "grandfather clause" (see SUFFRAGE) applicable to individual cities. These greatly restricted the negro vote. In June, 1915, the United States Supreme Court declared these statutes unconstitutional. State officers were for the first time nominated at direct primaries in 1911.

The Legislature of 1912 passed a measure providing for primaries for the election of presidential electors. Although the Republican sentiment was strongly for Roosevelt, as appeared from these elections, the control of the party remained in the hands of the Republicans. Following the nomination of Mr. Taft in Chicago, the Progressives formed a separate party. At the election of Nov. 5, 1912, Wilson carried the State with 116,654 votes, Roosevelt received 57,786 and Taft 54,956.

Senator Isidor Rayner died in 1912, and the Governor appointed William P. Jackson to fill his place until an election could be held, which would have been in 1914. In the meantime, however, the constitutional amendment providing for the election of Senators by the people had been ratified by the States. Governor Crothers issued a warrant for the election of a Senator by the people in November, 1913, although the Legislature had passed no law providing for the machinery and method for nominating and electing Senators. The Democrats nominated Blair Lee, the Republicans Thomas Parran, and the Progressives George L. Wellington. Lee was elected by a large plurality. His right to a seat in the Senate was questioned, and a hearing was held by the Senate Committee on Privileges and Elections; he was declared entitled to his seat in January, 1914.

In 1913 six amendments to the State constitution were ratified. The most interesting of these was one empowering the Legislature to place the penalty for bribery at elections upon the buyer of votes as well as the seller.

The term of Senator Smith expired March 4, 1914, when he was a candidate for reelection; he was opposed by E. S. Carrington, Jr., Republican, and V. C. Reichard, Progressive. At the election held in November, 1914, Mr. Smith was reelected. The most remarkable feature of this election was the decline of the Progressive vote, which from 57,786 in 1912 fell to 3697 in 1914.

The following is a list of the Governors:

PROPRIETARY GOVERNORS

Leonard Calvert.....	1634-47
Thomas Greene.....	1647-49
William Stone.....	1649-54
Commissioners.....	1654-58
Josias Fendall.....	1658-60
Philip Calvert.....	1660-61
Charles Calvert (became Lord Baltimore 1675).....	1661-76
Cecilus Calvert.....	1676
Thomas Notley.....	1676-79
Charles, third Lord Baltimore.....	1679-84
Benedict Leonard Calvert and Council.....	1684-88
William Joseph (President of Council).....	1688-89
Protestant Associates.....	1689-90
Nehemiah Blakistone and Committee.....	1690-92

ROYAL GOVERNORS

Sir Lionel Copley.....	1692-93
Sir Edmund Andros.....	1693-94
Francis Nicholson.....	1694-99
Nathaniel Blakistone.....	1699-1702
Thomas Tench (President of Council).....	1702-04
John Seymour.....	1704-09
Edward Lloyd (President of Council).....	1709-14
John Hart.....	1714-15

PROPRIETARY GOVERNORS (RESTORED)

John Hart.....	1715-20
Charles Calvert.....	1720-27
Benedict Leonard Calvert.....	1727-31
Samuel Ogle.....	1731-32
Charles, fifth Lord Baltimore.....	1732-33
Samuel Ogle.....	1733-42
Thomas Bladen.....	1742-47
Samuel Ogle.....	1747-52
Benjamin Tasker.....	1752-53
Horatio Sharpe.....	1753-69
Robert Eden.....	1769-76
The Convention and Council of Safety.....	1776-77
Thomas Johnson.....	1777-79

STATE

Thomas Sim Lee.....	1779-82
William Paca.....	1782-85
William Smallwood.....	1785-88
John E. Howard.....	1788-91
George Plater.....	1791-92
Thomas Sim Lee.....	1792-94
John H. Stone.....	1794-97
John Henry.....	1797-98
Benjamin Ogle.....	1798-1801
John F. Mercer.....	1801-03
Robert Bowie.....	1803-06
Robert Wright.....	1806-09
Edward Lloyd.....	1809-11
Robert Bowie.....	1811-12
Levin Winder.....	1812-15
Charles Ridgely.....	1815-18
Charles Goldsborough.....	1818-19
Samuel Stevens.....	1819-22
Samuel Stevens, Jr.....	1822-25
Joseph Kent.....	1825-28
Daniel Martin.....	1828-29
Thomas K. Carroll.....	1829-30
Daniel Martin.....	1830-31
George Howard.....	1831-33
James Thomas.....	1833-35
Thomas W. Veazey.....	1835-38
William Grayson.....	1838-41
Francis Thomas.....	1841-44
Thomas G. Pratt.....	1844-47
Philip F. Thomas.....	1847-50
Enoch L. Lowe.....	1850-53
Thomas W. Ligon.....	1852-58
Thomas H. Hicks.....	1858-62
August W. Bradford.....	1862-65
Thomas Swan.....	1865-68
Oden Bowie.....	1868-72
William F. Whyte.....	1872-74
James B. Groome.....	1874-76
John L. Carroll.....	1876-80
William T. Hamilton.....	1880-84
Robert M. McLane.....	1884-85
Henry Lloyd.....	1885-88
Elihu E. Jackson.....	1888-92
Frank Brown.....	1892-96
Lloyd Lowndes.....	1896-1900
John W. Smith.....	1900-04
Edwin Warfield.....	1904-08
Austin L. Crothers.....	1908-12
Phillips L. Goldsborough.....	1912-16
E. C. Harrington.....	1916-20
A. C. Ritchie.....	1920-

Riley, *History of the General Assembly of Maryland, 1635-1904* (ib., 1905); Kent, *Story of Maryland Politics* (ib., 1912); Richardson, *Side Lights on Maryland History* (ib., 1913); H. E. Buchholz, *Governors of Maryland* (ib., 1914); also annual reports and other publications of the Geological Survey, the Shell Fish Commission, the Board of Education, and other State boards.

MARYLAND AGRICULTURAL COLLEGE. A State institution for agricultural and scientific education, founded at College Park, Md., in 1856. The college includes departments of agriculture, horticulture, biology, chemistry,

canning, mechanical engineering, civil engineering, electrical engineering and general science, as well as courses for training teachers in agriculture and a summer school for teachers of rural schools. During the winter short courses in agriculture are given. The original college buildings, which were completed in 1859, and the administration building, completed in 1904, were destroyed by fire on Nov. 29, 1912. A temporary assembly hall, kitchen, and dining hall were erected. Calvert Hall, the dormitory, was completed in 1915. Other buildings are the library and gymnasium, buildings for the departments of civil and electrical engineering and physics, and Morrill Hall, containing the other important departments. The college sanitarium, completed in 1901, is used as an administration building. In 1914-15 there were about 500 students in all departments; of these 300 were in the regular courses and about 200 in the short courses. The faculty, including professors and instructors, numbered 40. The college has no endowment, the income depending upon annual appropriations made by the United States and the State of Maryland. The total annual income is about \$165,000 and the buildings and grounds were valued at about \$515,000. The library contains about 8000 volumes. The president in 1915 was Harry J. Patterson, D.Sc.

MARYLAND HISTORICAL SOCIETY.

An association founded in 1844 for the purpose of collecting and arranging material relating to the history of Maryland. It now owns the Athenaeum Building, on Saratoga Street, Baltimore, in which it has gathered a priceless collection of manuscripts, documentary records, books, and pamphlets. There is also a gallery of historic curios, portraits, and valuable paintings. The society has done great service in rescuing, editing, and printing historical data. It is the official custodian of the early archives of the State, and it is engaged in printing the most valuable of these records. Thirty large quarto volumes have already been issued. Its series of Fund Publications contains many valuable reprints and monographs.

MARYLAND YELLOWTHROAT. A North American warbler (*Geothlypis trichas*), common in summer throughout the continent. It is about 5½ inches long, olive green above and bright yellow below, with a conspicuous broad black band or "mask" across the forehead (of the male), which includes the bill, extends back to

MARYLAND YELLOWTHROAT.

a point on each side of the neck, and is bordered above by a white line; the female has only a dull white line above the eye. These warblers spend their time near the ground and make their nests there, usually beside a stream; and they utter a short, questioning song as characteristic as it is pretty. The name is rather misleading, as the species has been divided into five forms, the Maryland, Western, Florida, Pacific, and Salt

Marsh yellowthroats. Four closely allied species, the Kentucky warbler (q.v.), mourning, Connecticut, and McGillivray's warblers, were formerly placed in this genus but now are grouped as *Oporornis*. All of these visit the United States, while several others are found only in Mexico and Central America.

MARYLEBONE, mā'ri-lē-bōn', commonly mā'ril-bōn or mār'i-būn. A metropolitan and parliamentary borough in the northwestern part of the city of London. It is regularly laid out, with many handsome streets, and here are situated Regent's Park, the gardens of the Zoölogical and Botanic societies, the Coliseum, Middlesex and other hospitals, Bedford College for women, University College, several other denominational institutions, and the terminal stations of the Midland, Great Western, and Great Northern railroads. Here are located the residences of Charles Dickens, the artist Turner, Gibbon, the historian, and Faraday, the chemist. Pop., 1901, 133,329; 1911, 117,184.

MARY MAGDALENE, mäg'dā-lēn, or mäg'dā-lē'nē, or MARY OF MAGDALA. A woman mentioned in the Gospels as a follower of Jesus and, with others, a contributor to his support (Luke viii. 2-3). Her home was doubtless at Magdala (q.v.). She had been cured of demoniacal possession by Jesus and was among his most devoted friends. With the like-minded women she was a witness of the crucifixion (Matt. xxvii. 55, 56; Mark xv. 40-41; Luke xxiii. 48-49) and of the entombment of Jesus (Matt. xxvii. 61 and parallels). The same company came to the tomb on the Sunday morning following the crucifixion, and, finding it open and empty, ran back to the city to inform the disciples (Matt. xxviii. 1-10 and parallels). But Mary appears to have soon returned alone to the tomb, and to her the risen Jesus first appeared (John xx. 1-18; Mark xvi. 9). Her joy on hearing and seeing him again was excessive, but Jesus would not permit her to touch him, to show her that the relation between them was now entirely different from what it had been. Nothing more is told of her in the New Testament. The traditional identification of her with the "woman who was a sinner" (Luke vii. 36-50) is without foundation. This idea, the ruling one in art and literature, with its accompanying conception of the word Magdalene, has therefore no basis in fact. The Eastern church held that she died at Ephesus, whence her relics were taken to Constantinople. A mediæval legend in the Western church identified her with the sister of Martha and represented her as ending her days in southern France. Consult A. B. M. Jameson, *Sacred and Legendary Art*, vol. ii (London, 1866), and *Life of St. Mary Magdalene, translated from the Italian* (2d ed., Boston, 1906). For the tradition of her life in France, consult Faillon, *Monuments inédits sur l'apostolat de Ste.-Marie-Madeline en Provence* (2 vols., Paris, 1859).

MARY MAGDALEN IN ART. A favorite subject of painters during the Renaissance and the seventeenth century. Mary is chiefly represented as standing at the foot of the cross, assisting at the entombment, as the first witness of the Christ after the resurrection ("Noli me tangere"), or as a penitent. The small pot of ointment with which she once anointed the feet of Christ is the symbol by which she is identified. Among the most important representations of the subject was the celebrated painting of Cor-

reggio, now lost, but of which a good copy by Adriaen van der Werff survives in the Dresden Gallery. Titian has probably given the most impressive representations in his "Christ appearing to Magdalen," in the National Gallery, London, and in the well-known "Penitent Magdalen," in the Pitti Palace, Florence. Other representations are by Domenichino (Pitti Palace); Carlo Dolci (Uffizi, Florence); Van Dyck (Vienna Museum); Rubens (Vienna Museum); Tintoretto (Scuola di San Rocco, Venice); Murillo (Madrid); Memling (Louvre); Veronese (Madrid Museum); and three by Guido Reni in the Louvre, National Gallery, London, and Vienna Museum.

MARY OF BURGUNDY (1457-82). Daughter and heiress of Charles the Bold, Duke of Burgundy and sovereign of the Netherlands, born at Brussels. On the death of Charles (1477), Louis XI of France advanced various claims to the territories over which that prince had ruled. To defend herself Mary granted great concessions to the towns of the Netherlands and married Maximilian of Austria, with whom she lived happily for five years, dying from a fall from her horse. She was a woman of great beauty, intelligence, and amiability. Through her the Netherlands came into the possession of the house of Hapsburg, passing subsequently through her son Philip the Fair to her grandson Charles V (q.v.).

MARY OF GUISE, gwēz (1515-60). Queen of Scotland. She was the daughter of Claude, Duke of Guise, and Antoinette de Bourbon, and is also known as Mary of Lorraine. At the age of 19 she was married to Louis d'Orléans, Duke of Longueville, who died in 1537. In 1538 she married James V of Scotland, who died in 1542, soon after the announcement to him of the birth of a daughter, Mary, afterward Queen of Scots. Mary of Guise was Regent of Scotland for a short period, and showed herself an enemy of the party led by Arran and an opponent of the Reformed religion. She caused her daughter to be sent to France and plighted to the future Francis II, the marriage taking place in 1558. Consult Agnes Strickland, *Lives of the Queens of Scotland* (Edinburgh, 1861), and T. G. Law, in *Cambridge Modern History*, vol. iii (Cambridge, 1904), containing a bibliography.

MARY OF SAINT ANGELA, MOTHER. See GILLESPIE, ELIZA MARIA.

MARY OF THE INCARNATION (1599-1672). A French educator in Canada, born at Tours. Her name was Marie Guyard, but she was married in her eighteenth year to M. Martin. She was left a widow with an infant son before she was 20. She then gave herself almost entirely to religious work, devoting herself also for 12 years to the education of her son. Finally she claimed to have entered into a mystical marriage with the Christ, and entered the Ursuline convent at Tours. In 1639 she was chosen superior of the convent of Ursulines established at Quebec by Madame de la Peltrie (q.v.), whom she accompanied to Canada. Though a mystic and a dreamer, she showed great executive ability and managed the convent with success until her death. She was tall and stately, and impressed all with the strength of her personality. Many of the letters she wrote back to France were collected and published posthumously under the title *Lettres de la vénérable mère Marie de l'Incarnation* (Paris, 1681). There is also an autobiography prepared by di-

rection of her superiors. Consult: Martin (her son), *La vie de la vénérable mère Marie de l'Incarnation* (Paris, 1677); Charlevoix, *Vie* (ib., 1724); and the *Life* by Casgrain, published in his collected works, vol. iii (Montreal, 1886).

MARYPORT. A seaport and bathing resort in Cumberland, England, at the mouth of the Ellen, 28 miles southwest of Carlisle (Map: England, C 2). Shipbuilding and its kindred branches are carried on extensively, and there are manufactories of rope, duck, iron, steel, lumber, and leather. A large quantity of coal and coke is shipped, especially to Ireland. The town owns gas and water works, a slaughterhouse, and markets, and maintains an isolation hospital. Maryport was the seat of a Roman camp and is rich in antiquities. It was called Ellenfoot until 1750, when it received its present name, owing to the fact that Mary, Queen of Scots, landed here in her flight from Scotland. Its prosperity dates from 1750, when its harbor was built. Pop., 1901, 11,897; 1911, 11,418.

MARY'S RIVER INDIANS, or **CHEPEN-AFA**. See KALAPUYA.

MARY STUART (MARY, QUEEN OF SCOTS) (1542-87). Queen of Scotland from 1542 to 1567. She was born Dec. 7 or 8, 1542, at Linlithgow Palace, the daughter of James V of Scotland by Mary of Guise. Her father died within a week of her birth, and she was proclaimed Queen. The English began negotiations for her betrothal to Prince Edward (later Edward VI), but, though they declared war to enforce their demands, they were unable to do so. After the Scots were defeated at Pinkie Cleugh, the young Queen was sent for greater security to an island in the Lake of Monteith. Meanwhile negotiations were opened with France for her marriage to the Dauphin (later Francis II), and these were satisfactorily concluded on July 7, 1548, whereupon Mary was sent to France. At the French court Mary received a good education and showed considerable intelligence. On April 24, 1558, her marriage to the Dauphin took place, and, contrary to the public agreements, she bound herself secretly that, if she died childless, her Scottish realm and her right of succession to the English throne, as great-granddaughter of Henry VII, should pass to France. In 1559 her husband ascended the French throne, and during his reign of over a year Mary exerted supreme influence. But the death of Francis II, on Dec. 5, 1560, destroyed all her plans. Catharine de' Medici was hostile to her; and so, on Aug. 15, 1561, after considerable negotiation with the great Protestant lords of Scotland, she left France forever and returned to Scotland.

Her government began auspiciously, and even the religious situation caused at first little difficulty. Protestantism had received the sanction of the Scottish Parliament, and Mary did not oppose this settlement, stipulating merely for liberty to use her own religion. Moreover, she surrounded herself with Protestant advisers, her chief minister being her natural brother, James Stuart, an able and ambitious statesman, whom she soon created Earl of Mar, and a little later Earl of Murray (q.v.). Her chief difficulties were to come to an amicable agreement with Elizabeth concerning the succession to the English throne. The English Queen, however, was suspicious of Mary, and the question of whom the latter would marry complicated matters further, Elizabeth fearing that an alliance of the

Scottish Queen with a powerful foreign prince, like Don Carlos of Spain, would endanger her throne. Contrary to the advice of all, Mary, on July 29, 1565, married her cousin, Henry Stuart, Lord Darnley, who had some claims to both the Scottish and English thrones. The marriage was not a love match, but chiefly due to the fact that Darnley had considerable influence with the English Catholics, who would thus aid Mary in any plans she might have to obtain the English throne. On the other hand, the marriage alienated the powerful Protestant lords of Scotland, notably Murray, who rose in rebellion, and it made Elizabeth more suspicious than ever. The insurrection of the Protestant lords was suppressed, but Mary's eyes were soon opened to the mistake of her marriage with the worthless Darnley. She was disgusted by his debauchery and alarmed by his arrogance and ambition, which went so far as to prompt him to demand that the crown should be secured to him for life, and that if the Queen died without issue it should descend to his heir. Ascribing Mary's reluctance to accede to these demands to the influence of her confidential adviser, David Rizzio, an Italian of great ability, but generally hated as a foreigner and a Roman Catholic, Darnley conspired with the Protestant nobles to murder him and seize the government. It was stipulated that Protestantism should remain the recognized religion. On March 9, 1566, Rizzio was dragged from Mary's supper room and assassinated. Mary dissembled her indignation at her husband's treachery, succeeded in detaching him from the conspirators, and persuaded him not only to escape with her from their power by a midnight flight to Dunbar, but also to issue a proclamation in which he denied all complicity in their designs. Two of the chief conspirators, Ruthven and Morton, fled to England, while Murray and the Queen became reconciled. On June 19, 1566, Mary gave birth to a son (later James VI of Scotland and James I of England); but soon afterward she quarreled more than ever with Darnley, and the latter thought of leaving the country. Meanwhile the Queen showed more and more favor to James Hepburn, Earl of Bothwell, a needy and profligate noble. About Jan. 9, 1567, Darnley fell ill. Mary brought him to Edinburgh, and he was lodged in a small mansion. Here on February 9 the Queen visited him, but left him about 10 o'clock in the evening. Early the next morning the house in which Darnley slept was blown up, and his lifeless body was found in a neighboring garden. Bothwell was undoubtedly the murderer, and it is a matter of controversy whether or not Mary was privy to the deed. A mock trial was held, and Bothwell was acquitted. On April 19 he carried the Queen to Dunbar, probably with her full consent. He divorced his young wife, Catherine Gordon, whom he had married little more than a year before, and on May 15, 1567—only three months after her husband's murder—Mary became Bothwell's wife.

This last indiscretion of Mary arrayed all her nobles in arms against her. She was able to lead an army against them, but it melted away without striking a blow at Carberry Hill, June 15, 1567. She had to abandon Bothwell and surrender herself to the confederated lords, who led her to Edinburgh, and from there to Lochleven. At the latter place she was compelled on July 24, 1567, to sign an act of abdication in favor of her son. Escaping from her island prison May 2,

1568, Mary found herself in a few days at the head of a small army, but this was defeated on May 13 by the Regent Murray at Langside, near Glasgow. Four days afterward, in spite of the entreaties of her best friends, Mary crossed the Solway and threw herself on the protection of Queen Elizabeth, only to find herself a prisoner for life.

Mary was first taken to Carlisle, but on July 13, 1568, she was removed to Bolton. Elizabeth demanded that there should be an inquiry into Darnley's murder. Mary seems to have held out at this time hopes of marriage to the Duke of Norfolk, and there were several attempts to bring about a rising among the Catholics in England and Scotland in her favor. As a result Norfolk was executed, as being implicated, on Tower Hill, June 2, 1572. Undoubtedly Elizabeth would have been glad to be rid of her dangerous prisoner, but could not on account of her relations with Spain and France at the time. Mary was moved from place to place, until in April, 1585, she was placed under the care of Sir Amyas Paulet, and here all opportunity was given her to become entangled in the conspiracy of Antony Babington (q.v.) against Elizabeth. For this she was brought to trial, and though she denied all complicity, she was found guilty, and beheaded on Feb. 8, 1587, at Fotheringay Castle. She met her fate with great composure and dignity.

Mary was reputed to be the most beautiful woman of her time. Her whole life was dramatic, and hence it has never ceased to interest poets and historians. She was a woman of great ability and varied accomplishments. Her prose writings have been collected by Prince Alexander Labanoff in his *Recueil des lettres de Marie Stuart*. Setting aside the 12 sonnets which she is said to have written to Bothwell, and which survive only in a French version of an English translation, no more than six pieces of her poetry are now known. The best is the poem of 11 stanzas on the death of her first husband, Francis II. The longest is a *Meditation*. All are in French, except one sonnet, which is in Italian.

Bibliography. The different collections of English, French, and Spanish state papers contain much material. MARY SUMMER. The pseudonym of the French author Charlotte Marie (Filon) Foucaux (q.v.).

MARYSVILLE. A city and the county seat of Yuba Co., Cal., 52 miles by rail north of Sacramento, at the junction of the Yuba and the Feather rivers and on the Southern Pacific, the Western Pacific, and the Northern Electric railroads (Map: California, D 3). Steamers ply between here and San Francisco. A splendid levee system has been erected at a cost of \$2,000,000 to protect the city from river floods. Marysville is the seat of the College of Notre Dame (Roman Catholic) and has a fine public library, handsome courthouse and city hall buildings of quaint Spanish architecture, three parks, and splendid bridges spanning both rivers. The city is in an agricultural and mining region, dredger mining on the Yuba River near Marysville having placed the county among the leading gold-producing districts in the United States. The surrounding region is rich in the production of cereals, olives, rice, prunes, raisins, and seedless grapes. Among the industrial establishments are gold-dredger and traction-engine works, flour and woolen mills, and fruit drying and canning plants. The government, under a charter of 1876, is administered by a mayor, elected biennially, and a unicameral council, elected at large, though representing the city wards. Pop., 1900, 3497; 1910, 5340.

Marysville, built on the site of a trading post called New Mecklenburg, was founded in 1849 by Charles Covilland, a Frenchman, and was called Yubaville until 1850, when it was renamed after the founder's wife. In 1851 Marysville was chartered as a city; in 1852 it had 4500 inhabitants and, in 1855, 8000; and in 1860, when the gold work began to decline, it had become, on account of a large floating population, the third city in size in the State.

MARYSVILLE. A city and the county seat of Marshall Co., Kans., 113 miles by rail west of St. Joseph, Mo., on the Big Blue River and on the St. Joseph and Grand Island and the Union Pacific railroads (Map: Kansas, F 3). It has good water power and there are grain elevators, planing mill, greenhouses, marble yard, and manufactures of flour, machinery, cigars, cement blocks, lumber, wagons, brooms, etc. Pop., 1900, 2006; 1910, 2260.

MARYSVILLE. A village and the county seat of Union Co., Ohio, 28 miles northwest of Columbus, on Mill Creek and on the Toledo and Ohio Central and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, D 5). It is surrounded by a farming and dairying country and productive sheep district and has a large milk condensery, brass works, and other industrial establishments. Among the noteworthy features of the city are the State Reformatory for Women, State armory, high school (\$100,000), Carnegie library, and the various county institutions. Pop., 1900, 3048; 1910, 3576.

MARYSVILLE. A city and the county seat of Nodaway Co., Mo., 46 miles north of St. Joseph, on the Chicago, Burlington, and Quincy and the Wabash railroads (Map: Missouri, B 1). It has a State Normal School, State Farm and Experiment Station, conservatory of music, St. Francis Hospital, Carnegie library, and fine post-office and high-school buildings. Among the

industrial establishments are cigar, lightning-rod, and rope-halter factories, feed mills, a garment factory, foundry, acetylene-light factory, a serum laboratory, cement-block, meat-packing, and cider and vinegar plants, etc. A large trade in grain, cattle, and hogs is carried on. The water works are owned by the city. Pop., 1900, 4577; 1910, 4762.

MARYVILLE. A town and the county seat of Blount Co., Tenn., 16 miles south of Knoxville, on the Southern, the Louisville and Nashville, and the Tennessee and Carolina Southern railroads (Map: Tennessee, G 3). It is surrounded by a farming country and has flour, woolen, and planing mills, stove foundry, aluminum works, and coffin factory. The town possesses a fine courthouse and is the seat of Maryville College (Presbyterian), which was founded here in 1819, Maryville having been settled as early as 1795. Pop., 1910, 2381.

MARZIALS, mär'zi-älz, *Fr. pron.* mär'zè'äl', THÉODOR (1850—). An English poet and composer, born in Brussels. His father was a Frenchman, his mother a Yorkshire woman. He passed his boyhood in Brussels and in Switzerland, and studied with M. L. Lawson in London. In 1870 he became superintendent of the Musical Department in the British Museum. In 1872 he published for private circulation a pastoral called the *Passionate Dowsabella*, republished the next year in *A Gallery of Pigeons, and Other Poems*. The volume, showing some pre-Raphaelite influence, contains poems of striking beauty. Afterward he composed, with their music, many delightful songs. His ballads in Old English style have been especially popular in England and elsewhere. In 1882 appeared *Old Songs Arranged with Accompaniments*; in 1904, *Pan Pipes*.

MASA. See MOSGU.

MASACCIO, mã-sät'chô, properly TOMMASO GUIDI (1401-c.1428). One of the greatest Florentine painters, the pioneer of the early Renaissance in Florence. Our meagre information on his life is derived from the Florentine tax rolls. According to a statement given by his brother, he was born Dec. 24, 1401, the son of a notary, whose family, the Scheggia, were of Castello San Giovanni in the Val d'Arno. Here, it would seem, Masaccio was born. In 1422 he was enrolled in the guild of *speziali* (druggists), to which painters belonged, and in 1424 in the guild of painters proper. His nickname Masaccio (Hulking Tom) shows him to have been of careless and slovenly habits. In one of the tax-roll records it is stated that he lived with his mother and brother and that he neither collected what was due him nor paid his debts, from which it would seem that he was impractical in money matters. According to a notice by Vasari, based upon a contemporary statement by Landini, he lived to be only 26. That he did not attain a much greater age is proved by a tax roll of 1428, in which it is reported that he died at Rome.

In his art he was a pupil of Masolino, and was probably influenced by Brunelleschi and Donatello. He rendered very material assistance to Masolino (q.v.), perhaps even painted whole frescoes in San Clemente, Rome, as he certainly did in the celebrated Brancacci Chapel, Santa Maria del Carmine, Florence. When Masolino left these frescoes unfinished, Masaccio took charge of the work, and it was his achievements which gave them their supreme importance in

Florentine painting. Even in the works assigned to Masolino, as in the "Raising of Tabitha," the assistance of his superior pupil may be traced. The smallest of Masaccio's independent subjects is the "Expulsion from Paradise," a marvel in the rendition of movement, of the nude, and in emotional qualities. Eve cries aloud in her anguish, while Adam in deeper grief covers his face with his hands. Other frescoes of the series by him are "SS. Peter and John Healing"; "St. Peter Baptizing"; "SS. Peter and John Distributing Alms"; and "The Tribute Money." In the last-named fresco, a very large composition, Masaccio's genius is most completely expressed. Just below it, "St. Peter Enthroned" is by his own hand, as is also the design of the "Raising of the King's Son," in which the saint and the group on the left are in part by him, the remainder being by Filippino Lippi.

His frescoes in the Brancacci Chapel were epoch-making in Florentine painting. They determined the path it was to pursue to the end, and were the training school of painters as long as Florentine art remained worth while. Even Michelangelo was inspired by them, and Raphael introduced whole figures in his Vatican frescoes. What Donatello had done for sculpture and Brunelleschi for architecture, Masaccio did for painting. As early as 1436 Alberti, the greatest art theorist of the early Renaissance, ranks him with these artists and with Ghiberti and Luca della Robbia. Like Giotto, he was a supreme master of the significant. Avoiding unnecessary detail, he depicted only the essential. His naturalism was of the noble kind which does not sacrifice style. His knowledge of the nude far transcended that of the painters of his generation, and his frescoes, notwithstanding their ruined condition, evince decorative color of a high order. He was the first Italian painter with a perception of atmospheric perspective, and his landscape combines realistic with imaginative qualities of a high order.

His most important fresco, after those of the Brancacci Chapel, is the "Trinity," with the Virgin and St. John and donor and his wife, in Santa Maria Novella, Florence. The fresco in the oratory at Montemarciano seems an early work, but the Pietà in the baptistry of Empoli is more probably by Masolino (q.v.). The most important and numerous of Masaccio's surviving panels are a number belonging to an altarpiece painted in 1426 for the church of the Carmine in Pisa. Although the panels have been dispersed, the principal have been identified and an ingenious reconstruction of the altar has been attempted by Berenson. One panel, "St. Paul," is still at Pisa; four others, including the "Adoration of the Magians" and the "Martyrdom of SS. Peter and Paul," are at Berlin; while the centerpiece, a "Madonna Enthroned with Angels," belongs to the Sutton collection, Brant Broughton, Lincolnshire. Other panels of the same altar are the "Crucifixion," Naples, and "St. Andrew," belonging to Count Lanckoronski, Vienna. Mention should also be made of the "Madonna with St. Anne," in the Florentine Academy, an early but impressive panel. The portrait of a young man in the Gardner collection, Boston, ascribed by Berenson to Masaccio, is usually considered a school piece.

MASAI, mā-sī'. A mixed people in British East Africa, east of Lake Victoria, probably of Hamitic stock. They are divided into the nomad Masai, or Il Oikob, and the settled Masai, or Wa Kwafi, the latter having been forced to become agriculturists, both on account of the plague which destroyed their immense herds of cattle and the intertribal warfare that drove them into the territory of non-Masai tribes. The Il Oikob, or "Freemen," are typical Masai and are of magnificent physique, not one of the warrior class being under 6 feet in height. Their complexion is chocolate, their hair frizzly, and their eyes slightly oblique. The pure-blooded tribes have good features and, barring their color, would pass for Europeans, while among other tribes the coarse negro features are observed. Each tribe is nomadic within certain well-marked boundaries and the subdivisions are named from their geographical location. Their villages, set in a circle in which the cattle are herded, consist of huts of bent boughs plastered with cow dung, with flat roofs. Encircling the village is a strong *boma*, or thorn fence. They practice few arts, their weapons and utensils being procured largely by barter or from a subject tribe called Andorobbo living among them. The country is elevated and the climate temperate, so that the Masai wear more clothing than the tribes in the warmer parts of Africa. The women adorn themselves with a profusion of strings of beads and circlets of iron and brass. They wear the rudiments of a dress, consisting of a small apron in front and a larger at the back. The men have an upper garment of tanned skin, a length of cloth fastened at the neck and hanging down the back, armllets of ivory or horn, ornaments of slender iron chain, and a waist cloth. The hair is gathered into a sort of chignon which hangs below the shoulder blades. The ear lobes are enormously distended by ornament.

The Masai are divided into a number of clans, the symbol of which the warriors paint on their shields. The people are divided into married men, living in the villages, and warriors, living in the camps. The latter youths are set apart by the rite of circumcision on reaching puberty, occupy separate quarters, and are attended by the unmarried women. A diet of meat and milk is allowed them, but only one of these must be eaten at a time, and between the periods a purgative treatment is required. Before going on their raids they gorge themselves with blood and meat. The warrior's costume consists of an oval headress of ostrich feathers encircling the

face, a shoulder cape of vulture feathers, a belt and anklets of colobus monkey skin. Their weapons are a long-bladed assagai, a short sword and club, and an oval shield of buffalo hide. After serving his time the warrior settles down to married life, and then varies his flesh diet with vegetable food purchased from agricultural tribes. The Masai are dignified, self-contained, and intellectually capable. They practice no form of burial, the bodies of the dead being cast out to be devoured by hyenas. Prayers and offerings of grass dipped in cream are made to a superior deity; grass is also an offering to ward off evil. They believe in witchcraft and maintain shamans. Consult: Thomson, *Through Masai Land* (London, 1885); A. C. Hollis, *The Masai: Their Language and Folklore* (Oxford, 1905); M. Merker, *Die Masai* (2d ed., Berlin, 1910).

MASAMPO, mǎ-sǎm'pó; also called Masan by the Japanese. A treaty port of Chosen (Korea), on the south coast, west of Fusan. It was opened to foreign commerce on May 1, 1899. Pop., 1912, 34,000 natives, 300 foreigners, and a Japanese settlement of 3000. The climate is mild and the harbor good. Some lines of small steamers connect the town with Fusan. Its nearness to the latter city has interfered with its trade and development in the past, but the Japanese government is engaged in the construction of a naval station and a new Japanese city and hopes to make Masampo one of the most important commercial and industrial towns of south Chosen. Masampo became known to the world in 1900, through the unsuccessful efforts of the Russian government to obtain a lease of the place.

MASANIELLO, mǎ'zǎ-nyél'ló, properly TOMMASO ANIELLO (c.1623-47). A fisherman of Amalfi, leader of the revolt which took place in Naples in 1647 against the Spanish Viceroy, the Count of Arcos. The people had been exasperated by oppression, and great excitement had been produced by a new tax laid upon fruit, the chief sustenance of the poor. On July 7, 1647, the customhouse officers were assaulted in the market place by the infuriated people, Masaniello was chosen captain, and the houses of the tax farmers were sacked. The Governor fled to the castle, and Masaniello became master of the city, dispensing justice and punishing severely all attempts at brigandage. On July 13, in the church of the Carmelites, the Viceroy agreed to restore the ancient rights of the Neapolitans and to remove the oppressive taxes. The events of the week unbalanced Masaniello's mind; he became savage, cruel, and irresponsible. The people lost faith in him because of his compromise with the Viceroy; his lieutenants were seduced by the government, and he himself was murdered by a mob, who were furious, because of his supposed desertion to the Spanish party. Auber used the story of his life in *La muette de Portici*. Consult Saavedra, *Insurrección de Napoli en 1647* (Madrid, 1849). See MUETTE DE PORTICI.

MÁS Á TIERRA, mǎs á tyér'rá. See JUAN FERNANDEZ.

MASAYA, mǎ-sǎ'yá. A town of Nicaragua, 15 miles southeast of Managua and 10 miles from the north shore of Lake Nicaragua, near the volcano of Masaya, a broad, low mountain, about 3000 feet high (Map: Central America, D 5). The town stands in the centre of a fertile region, growing tobacco, coffee, sugar,

and rice, and is connected by railway with Granada and Managua. The natives manufacture cordage and palm hats. Pop., 1913 (est.), 13,000, largely native Indians.

MASBATE, mǎs-bá'tá. One of the Philippine Islands, situated nearly in the centre of the archipelago, about 30 miles south of the southeast end of Luzon (Map: Philippine Islands, D 4). Together with Burias, Ticao, and a few other smaller islands it forms the Province of Masbate. It is in the form of two legs of a triangle, with the large Bay of Asid opening towards the south. The eastern leg extends 82 miles from northwest to southeast, with an average width of 15 miles, and from this the western leg projects about 24 miles. The area of the island is 1236 square miles, of Burias 197, of Ticao 121, and of the whole province 1569 square miles. The island is very mountainous, rising at points to about 2500 feet; the principal chain sending out a number of spurs, extends in a semicircle from the northwest to the southeast end. Its rivers are all very short. The tropical climate is subject to frequent and sudden changes.

There are extensive forests in the interior and the principal occupation of the inhabitants is lumbering and the extraction of forest products. Stock raising, important before the Spanish-American war, has suffered greatly since from the rinderpest. Fishery is carried on to a great extent, but agriculture is in a backward state. The principal manufactures are sugar sacks and palm mats, the latter being noted for their excellent workmanship and durability of colors. The commerce is considerable, as Masbate lies not only opposite the Strait of San Bernardino, one of the two main eastern entrances to the archipelago, but also in the direct route from Manila to Samar and Leyte. There are several excellent landlocked harbors. The population of the island is about 30,000 and of the whole Province of Masbate was, in 1903, 43,675, of whom 10,183 lived in Ticao and 1627 in Burias. The tribe of the Visayans constitutes nearly 93 per cent of the population; there are also 2205 Bicolos and 583 Tagalogs. The capital is Masbate, situated on the north coast; it is a port of entry, with a good harbor and a population of 4018.

Perfect peace prevailed throughout the island before the end of the year 1900, and the inhabitants showed great eagerness to have civil government established, which was done on March 18, 1901.

MASCAGNI, mǎ-skǎ'nyé, PIETRO (1863-). An Italian composer. He was born at Leghorn, of humble parentage. Unknown to his father, the boy began to study music with Soffredini, and subsequently his uncle furnished him with the means to continue his studies. At the Milan Conservatory he worked for a little while, under Ponchielli and Saladino, but suddenly broke off his studies to make a tour with an operatic troupe. For a few years he made a precarious livelihood by conducting various traveling opera companies, until he achieved his phenomenal success in 1890 with *Cavalleria Rusticana*. The great promise held out by this work was never fulfilled. The public was carried away by the excellent libretto and the dramatic intensity of the music; but the musicians could not be blind to the glaring defects of musical workmanship and the crudity and brutality of the orchestration. Instead of remedying these

faults by means of serious study, Mascagni, intoxicated by this easily won success, continued to write. *Amico Fritz* (1891), *I Rantzau* (1892), *Ratcliff* (1894), *Silvano* (1895), *Zanetto* (1896), were complete failures. *Iris* (1898) was moderately successful. The last-named opera was revived at the Metropolitan Opera House, New York, in 1915. *Le Maschere* (1901), *Amica* (1905), again were signal failures; while *Isobel* (1911) scored a great popular success, but left the critics cold. *Parisina* (1913) met a very indifferent reception. With *L'Alodoletta* (1915) the composer ventured for the first time into the field of comedy. How a musician so deficient in the technic of his art could have occupied the post of director of the Liceo Rossini at Pesaro from 1895 to 1903 will forever remain a mystery. He made several tours of European countries, meeting with varying success. But his American tour of 1902 was a complete fiasco. Consult: G. Bastianelli, *Pietro Mascagni* (Naples, 1910), and E. Pompei, *Mascagni nella vita e nel arte* (Rome, 1912).

MASCARA, mäs-kä'rá, *Fr. pron.* mäs-ká'rá'. The capital of an arrondissement and a fortified town in the Province of Oran, Algeria, 45 miles southeast of Oran, on the slope of the Atlas Mountains. Mascara stands on the site of a Roman colony and is inclosed by walls 2 miles in length. Two of its ancient buildings remain and the city is now of the French colonial type. In 1832 it became the residence of Abd el Kader, who was born in the neighborhood. It was burned by the French in 1835, afterward regained by Abd el Kader, and finally taken by the French in 1841, since when it has developed into an important trading centre, doing an extensive trade in cereals and oil and in the famous wine that bears its name. Pop., 1901, 20,992; 1911, 24,254.

MASCARENE (mäs-ká-rén') **ISLANDS**. The collective name given to the islands of Réunion, Mauritius (qq.v.), and Rodriguez, situated east of Madagascar.

MASCARILLE, mä'ská'rêl'. A type of valet distinguished for effrontery, intrigue, and impudence, immortalized by Molière in *L'Etourdi*, *Les précieuses ridicules*, and *Le dépit amoureux*.

MASCARON, mä'ská'rôn', **JULES** (1634-1703). A French prelate and court preacher. He was born at Marseilles. He was intended for the law, but preferred the Church, and entered the Congregation of the Oratory. He began preaching in 1663, and soon attracted attention, and wherever he went in the provincial towns—as Angers, Saumur, Marseilles, and Nantes—large audiences, representing various classes, and even the learned, thronged to hear him. In 1666 he was called to the court, where his reputation continued to increase. He gained and held the favor of King Louis XIV notwithstanding his unsparing denunciation of fashionable and even royal sins. He was made Bishop of Tulle in 1671, and was transferred thence in 1679 to a more responsible position at Agen; but still continued to preach before the court. The most famous of his orations was that on Marshal Turenne (1675). Other orations which have been much admired are those on Chancellor Séguier, Queen Henrietta of England, and the Duke of Beaufort. A collection of his sermons and orations, edited by Father Borde, a member of the Congregation, was published in 1704. His sermons may also be found in a collection of funeral orations by Bossuet, Fléchier, and Mas-

caron (Paris, 1734). *Œuvres de Mascaron* appeared in Paris in 1828.

MASCART, mä'skär', **ELEUTHÈRE ELIE NICOLAS** (1837-1908). A French physicist, born at Quarouble, Nord. He was educated at the Ecole Normale Supérieure. He succeeded Regnault at the Collège de France in 1872 and in 1878 he was made director of the Government Central Meteorological Bureau, a post he held until 1907, during which time he greatly improved its organization, equipment and work. He was a member of the International Bureau of Weights and Measures. He was elected a member of the Academy of Sciences in 1884, taking the place of Jamin, and in 1904 became its president. Mascart was honored with the various decorations of the Legion of Honor, being made a commander in 1889. He conducted a number of important investigations in spectroscopy, especially of the ultra-violet rays and various interference phenomena. He also made valuable studies in various fields of electricity, working in 1881-84 on the unit of resistance, and later on atmospheric electricity and terrestrial magnetism. He is the author of *Éléments de mécanique* (1866); *Traité d'électricité statique* (1876); *Leçons sur l'électricité et le magnétisme*, in collaboration with Joubert (1882); volume ii of *Méthodes de mesures et applications* (1888); *Traité d'optique* (1889), and *Traité de magnétisme terrestre* (1900).

MASCHERONI, mäs-ká-rō'nē, **LORENZO** (1750-1801). An Italian mathematician, born at Castegnetto. He was educated at the University of Pavia and at the Collegio Marsiano di Bergamo. He served as professor of literature, and after 1786 of mathematics, at the University of Pavia. Although he had been ordained to the Roman Catholic priesthood, he supported the revolutionary changes of the time, and became a deputy of the Cisalpine Republic. In 1798 he was a member of the international commission to establish a new metrical system. He wrote considerable verse, including *Versi sciolti di Daphni orobiano a Lesbia cidonia* (1793), and *Versi sciolti indirizzati alla contessa Paolina Secco-Suardi Grisoni* (1808). His mathematical writings include: *Sulle curve chè servono a delineare ore ineguali degli antichi nelle superficie piane* (1784); *Nuove ricerche sull'equilibrio delle volte* (1785); and his chief work, *Geometria del compasso* (1795).

MASCLE, mäs'k'l (OF. *mascle*, *macle*, Fr. *macle*, from Lat. *macula*, spot). A heraldic bearing in the form of a lozenge pierced in the centre. See **HERALDRY**.

MASCOUTEN, mäs-kō'tēn (from *Mashkodainsug*, little prairie people). An Algonquian people of the Illinois River concerning whom there has been much controversy. From a misinterpretation of their Algonquian name they were known to the Hurons, and hence to the French, as the "Fire Nation" (*Nation du Feu*). Much of the confusion in relation to the name arises from the fact that it was apparently used in a general as well as a specific sense and applied without warrant to more than one Algonquian band of the Illinois and Wabash prairies. According to the traditions of the Ojibwa and Ottawa they drove the Mascouten from the neighborhood of what is now Mackinaw, and forced them to retire to the southern end of Lake Michigan. In 1712 they joined the Foxes and Kickapoo against the French, but suffered terrible reverses, losing 150 in a single en-

counter. In the same year the Potawatomi and other Northern tribes made a concerted descent upon the Mascouten and Foxes and killed or took captive one thousand of them, pursuing the survivors as far as Detroit. The power of the Foxes was completely broken by this war with the French and their allies, and the Mascouten were so far reduced that in 1736 they were said to number but 60 warriors, living then with the Kickapoo in southern Wisconsin. They are now extinct.

MASCOV, mäs'kôf, JOHANN JAKOB (1689-1761). A German publicist and historian, born at Danzig. He studied theology and law at the University of Leipzig, where he was afterward appointed professor of law and history. Of his publications, the following are considered of great merit: *Principia Juris Publici Imperii Romano-Germanici* (1729; 6th ed., 1769), which for a long time remained a model textbook in many universities; and *Geschichte der Deutschen bis zum Abgang der merovingischen Könige* (1726-37), a very valuable volume for the early history of Prussia, one of the first to consider the nation rather than its rulers. Consult W. Goerlitz, *Die historische Forschungsmethode* J. J. Mascovs (Leipzig, 1901).

MAS-D'AZIL, mã'dá'zèl'. An archæological grotto in the Department of Ariège, France, yielding relics especially of the latest Paleolithic period. See PALEOLITHIC PERIOD.

MASDEU, mäs-dá'ôö, JUAN FRANCISCO (1744-1817). A Spanish historian, born at Palermo. He entered the society of Jesus in 1759, was professor in Jesuit seminaries at Ferrara and Ascoli, visited Spain in 1799, was exiled, and returned in 1815 to Valencia, where he died two years later. His great work, which subsequent investigations have not yet entirely superseded, and which despite its 20 volumes was not complete (continuation on the same scale would have carried it to 50 volumes), is the *Historia crítica de España y de la cultura española* (1783-1805).

MASEFIELD, JOHN (1875-). An English poet and dramatist, born in the west of England. As a boy he was a sailor on the ship *Conway*, and made many voyages. Not only at sea but on land was his early life adventurous; among other occupations he had been a farm laborer, and a bar-tender in a New York saloon. These experiences of the lower strata of society were later to prove grist for his literary mill. When he abandoned the sea, ceased roaming, and established himself in or near London, Masefield became a constant writer in prose and in verse. In 1912 the Royal Society of Literature awarded him the Edmond de Polignac prize for poetry. His best poetic work is, perhaps, found in his ballads of the sea, and in such narrative poems as *The Everlasting Mercy* and *The Widow in the Bye Street*, memorable for the vitality of their stark realism, for their terrible pathos, and for the curiously monotonous but effective chant that the verse form supplies. His sketches and stories of the sea, with the savor of storm-tossed brine about them, are appealing in their blend of romance and picturesque realism. His stories for boys are in a vein to please young readers. His plays, impressive, if sometimes crude, show remarkable evidence of a rapidly increasing power; they are essentially plays for reading, however, rather than for the theatre. The following list of Masefield's varied productions is representative of the range of his work: *Salt-Water Ballads*

(1902); *Sea Life in Nelson's Time* (1905); *A Mainsail Haul* (1905; reissue, 1913), tales and sketches of the sea; *On the Spanish Main, or Some English Forays* (1906); *Captain Margaret, A Romance* (1908); *The Tragedy of Nan and Other Plays* (1910); *The Tragedy of Pompey the Great* (1910), an historical drama; *Ballads* (1910); *The Street of To-day* (1911); *William Shakespeare* (1911), in the "Home University Library"; *Jim Davis* (1912), a story for boys; *The Story of a Roundhouse and Other Poems* (1912); *The Everlasting Mercy*, and *The Widow in the Bye Street* (two narrative poems, written earlier than 1913, but then published in one volume); *Philip the King* (a drama), and *Other Poems* (1914). In addition Masefield wrote introductions to *Hakluyt's Voyages*, the *Voyages of Marco Polo*, and selections from Daniel Defoe, and edited *The Voyages of Captain William Dampier* (1906).

MASÈRES, mã'zâr', FRANCIS (1731-1824). An English mathematician, historian, jurist, and reformer, born in London, of Huguenot descent. He was educated at Clare College, Cambridge, obtained a fellowship, and was admitted to the bar. Soon afterward he went to Canada and in 1766 was appointed Attorney-General, which position he held for three years. He lived in Quebec until 1773. Upon his return to England the same year he became curator baron of the Exchequer (1773-1824). He was also senior judge of the Sheriff's Court, London (1780-1822). When the Quebec Act (q.v.) was being debated in the House of Commons, Masères was one of the important witnesses, but testified in partial opposition to Sir Guy Carleton (Lord Dorchester) (see CARLETON), whose recommendations were finally embodied in the Act. Masères, although of French descent, had strong Protestant prejudices, which led him to oppose the granting of full civil and religious freedom to the French Canadians. He published: *Principle of Life Annuities Explained in a Familiar Manner* (1783); *Scriptores Logarithmici* (1791-1807); *Scriptores Optici* (1823); *Select Tracts on Civil Wars in the Reign of Charles I* (1815); besides a large number of scientific papers, political, historical, and religious books and pamphlets.

MASHAM, ABIGAIL, LADY (1670-1734). A friend and confidante of Queen Anne of England. She was born in London, the daughter of Francis Hill, a merchant, and his wife Mary Jennings, an aunt of the Duchess of Marlborough, by whose influence she was appointed a lady of the bedchamber to Princess Anne. She became the confidante of the Princess, and, after the latter became Queen, her genial personality increased in the royal favor as the imperious bearing of the Duchess became more and more intolerable. In 1707 Abigail was married to Samuel Masham, a gentleman of the bedchamber to Prince George of Denmark. This marriage brought about an open rupture with the Marlboroughs. The intrigues of Mrs. Masham finally resulted in the overthrow of the Whigs, the elevation of Harley to power, and the dismissal of the Duke of Marlborough. Mrs. Masham was engaged in plots to bring back the Stuarts, and she seems always to have used her position for her pecuniary advantage. Her husband was raised to the peerage in 1712. Lady Masham adhered to Bolingbroke in the quarrel between him and Oxford. After the death of Queen Anne in 1714 she lived in retirement. See ANNE.

MASHAM, SAMUEL CUNLIFFE LISTER, first

BARON (1815-1906). An English inventor. He was born near Bradford, and in 1838 his father set him up in the worsted-milling business at Manningham. During his lifetime he took out more than 150 patents, mostly in connection with cloth making. His wool-combing machine was especially profitable, and so greatly was it in demand that he made a profit of nearly \$5000 on each machine sold. His silk combing for utilizing silk waste became a success in 1864, and by 1878 he had developed a velvet loom that yielded him a million dollars' profit annually. He was made first Baron of Masham in 1891. He published *Lord Masham's Inventions* (1905).

MASHERBRUM, mûsh'ër-brûm. See HIMALAYA.

MASHONALAND, mâ-shô'nâ-lând. One of the two divisions, or provinces, of Southern Rhodesia, between Matabeleland and the Zambezi River (Map: Congo, F 6). It consists mainly of a fertile, savanna-covered plateau, 3000 to 5000 feet above the sea, intersected by several affluents of the Zambezi and the Sabi. The climate is healthful to Europeans. Gold has been found in considerable quantities. The white population in 1911 numbered 12,631; native population, 495,451; in addition there were a number of Asiatics and other colored persons. The chief towns are Hartley, Umtali, Gatooma, Victoria, and Salisbury, the capital of southern Rhodesia, with 3479 white inhabitants in 1911. A railway from Beira, on the coast of Portuguese East Africa, was opened, via Umtali, to Salisbury in May, 1899. In October, 1902, a railway 301 miles in length was completed between Salisbury and Bulawayo (in Matabeleland). The main line ("Cape-to-Cairo" railway) was completed in June, 1904, from Bulawayo 282 miles to Victoria Falls, where it crosses the Zambezi on a bridge 650 feet long, 30 feet wide, and about 420 feet above the water. The bridge was formally opened in September, 1905. In 1889 Mashonaland was acquired by the British South Africa Company, and in 1893 the company's possession was secured through a successful war with the Matabeles, who in July of that year began hostilities by a raid into Mashonaland. See RHODESIA.

The ruins of south Mashonaland, of which the best known are those of the Zimbabwe group, are numerous. Along the gold-bearing reefs are thousands of excavations into the quartz veins as well as many hundred ancient ruins, temples, fortresses, and the like. The early history of this region was not known by the Mashonas who were living here at the time of the advent of the Europeans. The announcement of the finding of the ruins by the traveler Carl Mauch in 1871 attracted much attention, and in 1891 Theodore Bent surveyed and described the ruins of Zimbabwe. He found one portion to be elliptical with a round tower and to cover a considerable area of a gentle rise; below this in the valley lay a mass of ruins; while another structure, apparently a fort, crowned a bold, rocky hill. The walls are constructed of small, squared blocks of rough-face granite, laid dry, and occasionally having ornamental courses in herringbone or chevron pattern. The walls are very thick, in some places standing over thirty feet, and the coursing and broken joints show fair skill in masonry. The elliptical ruin has several gateways, the interior is broken by walls into a labyrinth, and in a central space are an altar and two remarkable round towers, the latter built

solid. Monoliths of rough, unhewn blocks of granite, set in the ground, occur in these ruins, and in some cases the monoliths are set upright on the top of the wall. The hill fort consists of curving walls built among gigantic granite boulders, forming a maze above a cliff 90 feet high, and is flanked on the accessible side by a wall 36 feet high and 13 feet thick at the top. Around the rude altar in the temple ruins were found phallic emblems, birds, and decorated bowls carved from soapstone. Remains of gold smelting furnaces with crucibles and pottery blow-pipes, and stone ingot molds, were discovered, and glass beads, celadon pottery, Persian pottery, and Arabic glass occurred in the ruins. Spear-heads and arrowheads, battle-axes, bells, chisels, spades, and other tools were taken out. The ruins have been ascribed to the pre-Mohammedan Arabs, probably of the Sabæo-Himyaritic period, so that there seemed good reason for locating the Land of Ophir in this region. These conclusions were challenged by Randall-MacIver, who holds that glass and porcelain sherds not older than of the 14th century occur in the lowest strata examined, and that accordingly the ruins are of merely mediæval antiquity. This view is also accepted by Von Luschan, who regards practically all the finds as of Kafir origin. On the other hand, Passarge pleads for an old Sabæan culture, which may have become deteriorated and invested with a Kafir veneer.

The Mashonas are a Bantu negro people, whom the Matabeles have driven to live in hill forts overlooking their fields. They are peaceful agriculturists, raising corn, sweet potatoes, rice, tobacco, and Indian hemp. They have herds of cattle and goats, and a common occupation is hunting for gold. The Mashonas are of chocolate-brown color, above the average height, slender in build, and the young women have good figures and are graceful. The men wear bracelets of buffalo hide, necklaces of bone and claws of gazelle hoofs, and aprons of leather interwoven with beads of iron and brass. Their headdress is of feathers and their coiffure is elaborate. The two front teeth are filed to a V-shape. The women shave their heads, but young girls string beads on their hair. They wear aprons, and their bodies are decorated with raised tattooing. The warriors carry three assegais, a club, shield, and battle-axe. The bow and arrow are also used. They are skillful iron smelters and workers, using the double bellows and working out implements and weapons with stone tools. They also make pottery, wooden dishes, and bark cloth. They smoke and snuff tobacco and use the narcotic hemp to excess. Travelers remark on their fondness for heat; many are disfigured from scorching caused by sleeping too near the great fires. Their musical instruments are the African harp, jew's-harp, and drum.

MASH'PEE. A settlement of New England Indians in Barnstable County, Mass., established as a reservation in 1660. From that time to the present they have intermarried with negroes and whites, but 206 of them still claim their Indian identity.

MAS'INIS'SA, or **MAS'SINIS'SA** (c.239-148 B.C.). King of the Massylians, in eastern Numidia. He was educated at Carthage, receiving a thorough training in Latin and Greek, and in 213 B.C. induced his father to form a league with the Carthaginians, with whom he fought successfully, in 212, against Syphax, King of the Massæsylians, in western Numidia, the ally of the Romans. He then passed over into Spain at the head of a troop of Numidian cavalry, and displayed great zeal and valor in the war against Rome. But the victory of the Romans at Silpia in 206 B.C., and (so the story goes) the action of the Carthaginians in giving Sophonisba, the beautiful daughter of Hasdrubal (son of Gisco), who had been promised him in marriage, as wife to his old rival Syphax, led Masinissa to enter into an alliance with the Romans. The Carthaginians incited Syphax to make war upon him. Defeated and stripped of his sovereignty, which he had just inherited from his father, Masinissa was compelled to seek refuge on the coast of Syrtis, where he bravely defended himself until the arrival of Scipio in 204 B.C., when he identified his cause with that of the Romans. He defeated Syphax, overran his country, captured Cirta, his capital, and took prisoner his Queen, Sophonisba, whom Masinissa still loved. Scipio, who feared the influence of the Carthaginian princess, demanded her surrender as a captive of war, and Masinissa, to spare her the shame, gave her poison to drink. In the decisive battle of Zama, which followed the arrival of Hannibal in Africa (202 B.C.), he made a brilliant charge at the head of his Numidian horse, drove the cavalry of Hannibal from the field, and was the first to turn the tide of battle against the Carthaginians. For this service he received the Kingdom of Syphax in the following year. He now profited by the leisure which peace afforded him, devoting his attention to the organization of his government, and to the civilizing of his semibarbarous subjects. He put the finances on a sound basis, and developed a formidable army and fleet. But his lust of conquest was never satiated. He made continuous inroads into the territory of Carthage, and his depredations finally drove the Carthaginians to war (150 B.C.), an event which the Romans seized as a welcome pretext for intervening and utterly crushing their ancient rival. Consult Meltzer-Kahrstedt, *Geschichte der Karthager*, vol. iii (Berlin, 1913).

MASK (Fr. *masque*, origin uncertain; probably from Sp. *máscara*, from Ar. *maskharat*, buffoon, mask, from *sakhara*, to ridicule). A disguise or covering of the face, worn either to aid in the simulation of some character or for other purposes, as in the rites of savage people for the frightening away of demons or even protecting the faces of the dead. The use of masks in the drama originated perhaps in the harvest festivities of the most ancient Greek peasantry, appearing subsequently to have been associated with the representation of Satyrs, Silenus, and Bacchus in the orgies of Bacchus. In Greek tragedy, which was an outgrowth from these, masks were used from the first, and in comedy at least at a later day. Regular types of masks

were developed for the different characters in tragedy and comedy, expressive of fixed emotions. They were often provided with metallic mouth-pieces for the purpose of increasing the power of the voice, as was made necessary by the great size and openness of the ancient theatres. Their use indeed was adapted both to the vastness of the buildings and to a formal style of dramatic representation in which the ideal prevailed over any reality of individual impersonation. In the modern theatre the use of masks, coming down through the mimes and pantomimes of the Romans and the early Italian *commedia dell'arte* (comedy of masks), has been chiefly confined to that class of entertainments in which the very names of the characters, like Pantaloon and Harlequin (q.v.), have been derived from Italy. The use of masks at costume balls also originated in Italy, where the domino, or half mask, worn by ladies, became especially popular.

The name death masks is given to masks, usually of plaster, made after death. In the preparation of these masks the face of the dead body is usually covered with oil, and plaster of Paris is then applied. After the plaster has hardened it is removed, being prevented by the oil from adhering too closely to the skin. Into the mold thus formed fresh plaster is poured, and the resulting cast is the death mask. Such masks are of the utmost value as exact resemblances of the faces from which they are taken, although the change of contour caused by death necessarily impairs to some extent their value. Similar masks are occasionally made from living men. Here, however, the mobile expression is frequently of necessity sacrificed, so that it is in general true that the more expressive the living face, the fainter is the likeness, while a set and determined face gives, as a rule, a clear and accurate mask. The use of death masks is both ancient and widespread. The Romans made them of wax, while among the Egyptians and in the ruins of Hissarlik masks of thin gold plate have been found, and among the American Indians occasional specimens have been discovered.

Among certain groups of savages, masks play an important rôle in their ceremonials. They are sometimes constructed to imitate living forms, as of animals, but more often to portray mythological characters. As a consequence the imagination of the maker is allowed a certain freedom, and the result is seen in the grotesque productions which are familiar from the ethnological collections of our museums. They are most commonly employed in shamanistic rites and in dances of a religious and more or less secret character. Their use is perhaps most prominent in North America, particularly among the tribes on the North Pacific coast, and in the islands of the South Seas, notably in the Melanesian group. The French form of the word, "masque" (q.v.), is now used in English to designate a form of drama in which the mask is, or was originally, worn.

MASK. In architecture and decoration, the face of a human being or animal, conventionalized in character; sometimes called a *maskaron* (French). The Greeks and Romans copied the tragic and comic masks of their actors in sculpture and painting for decorative purposes, and similar designs, but with exaggerated grotesqueness, were popular with the late Renaissance artists, especially of the Baroque period, for the keystones of doorways and other prominent positions.

MASKAT, mā-skāt'. A town of Arabia. See **MUSCAT**.

MASKED PIG. An extraordinary breed of domestic swine, cultivated in Japan. It is black, has a short head, broad forehead and muzzle, great ears, and deeply furrowed skin; and thick folds of skin, which are harder than the other parts, resembling the plates on the Indian rhinoceros, hang about the shoulders and rump.

MASKEGON, mā-ke'gon (Swamp People). A wandering Algonquian people, a division of the Cree, scattered over the immense swamp region of British America, stretching from Lake Winnipeg to Hudson Bay, including the basins of the Nelson and Severn rivers. In former times they lived entirely by hunting and fishing, to which those upon reservations now add lumbering and a little farming. As they are officially classed with the Cree, no reliable estimate of their population can be given, but they may number from 1500 to 2000.

MAS'KELL, WILLIAM (c.1814-90). An English theologian, born at Bath. From University College, Oxford, he graduated B.A. in 1836, and the next year took holy orders. In 1842 he became rector of Corscombe in Dorsetshire, where he began his researches in Church history, particularly in the Anglican ritual. He produced at this period the *Ancient Liturgy of the Church of England* (1844); *History of the Martin Marprelate Controversy* (1845); and *Monumenta Ritualia Ecclesiae Anglicanae* (1846). These works placed him among the most able exponents of High Church doctrines. Resigning Corscombe, he became vicar of St. Mary's Church near Torquay, and domestic chaplain to the Bishop of Exeter (1847). His earlier investigations were now followed by *Holy Baptism* (1848); *An Enquiry into the Doctrine of the Church of England upon Absolution* (1849); and a volume of doctrinal sermons. He took an active part in the Gorham controversy (q.v.); and when Gorham won his case in the Privy Council, Maskell went over to the Church of Rome (1850). To the Privy Council he had addressed two memorable letters on the *Present Position of the High Church Party* (1850). Maskell never took orders in the Church of Rome. His later life was passed in the west of England, where he resumed his learned researches, publishing, among several works, *Protestant Ritualists* (1872) and *Ivories Ancient and Medieval* (1875). He died at Penzance, April 12, 1890.

MASKELYNE, mā'ske-lin, NEVIL (1732-1811). An English astronomer, born in London. He was educated at Westminster and at Cambridge; carried out numerous investigations characterized by extreme accuracy of work, and became in 1765 Astronomer Royal and director of

the observatory at Greenwich. He introduced into navigation the method of determining longitude by lunar distances. He founded *The Nautical Almanac* in 1767, and published *The British Mariner's Guide* (1763); *Astronomical Observations* (1765); and other works.

MASKINONGE, mā'ski-nōnj, or **MUSKEL-LUNGE**, mūs'ke-lūnj (Algonquin, great pickerel, from *mas*, great + *kinonge*, Chippewa dialect *kenozha*, *kinoje*, pickerel, from *kenose*, long). The great pike (*Lucius masquinongy*, or *Esox nobilior*) of the lakes of the northern United States and Western Canada, from the Ohio River northward. This magnificent fish, the largest of its family, and the most to be feared as a predatory force in American fresh waters, has the general form of a pike (q.v.), a length of from four to eight feet, and often a weight exceeding 100 pounds. It is swift, strong, and fierce, and a high prize for the angler. Its characteristics are its dark-gray color, the sides in the typical form (confined to the Great Lakes) with blackish spots of varying size on a grayish-silvery ground; the fins are spotted with black; and the opercle and lower parts of the cheeks are scaleless. See Colored Plate of AMERICAN GAME FISHES, accompanying article **TROUT**.

MASK'WELL. In Congreve's *Double-Dealer*, the scoundrel from whose character the play is named.

MASOCH, LEOPOLD VON SACHER. See **SACHER-MASOCH**, LEOPOLD VON.

MASOLINO DA PANICALE, mā-sō-lē'nō dā pā'nē-kā'lā (1384-c.1440). A Florentine painter of the Renaissance. The facts of his life are little known and much disputed. According to the traditional account, based upon Vasari, he was born at Panicale di Valdelsa, whence his usual name; but Crowe and Cavalcaselle identify him with Tommaso di Cristoforo Fini, in which case he would have been born at Florence. Masolino is a diminutive of Tommaso, which was certainly his given name. There is nothing to confirm Vasari's statement that he was an assistant of Lorenzo Ghiberti; but the statement that he was a pupil of Gherardo da Starnina, a later Giottesque master, is not unlikely. In 1423 he was admitted to the guild of physicians and apothecaries, in which the painters were enrolled. In 1426 he departed for Hungary, where he painted under the patronage of Filippo Scolari, a Florentine who had attained a position of great importance there. In 1428 he was employed at Castiglione di Olona.

His only undisputed works are two, one a series of frescoes at Castiglione di Olona, in the Province of Como, northern Italy. Of these one representing the "Life of the Virgin," which is signed by the master, is in the Collegiate Church. Another more interesting series, representing the "Life of St. John the Baptist," is in the Baptistery near by; while the Palazzo contains an independent landscape with decorative friezes. Of the frescoes in the Baptistery the "Feast of Herod," "Herodias and Salome," and the "Baptism of Christ" are especially noteworthy. They reveal a transitional art, still containing mediæval elements, but Renaissance in viewpoint and in many salient features—such as the perspective, classic decoration, a naturalistic conception of the human body studied from the nude, and strictly realistic portraiture in contemporary costume.

A second series of frescoes, originally attrib-

uted to Masolino by Jakob Burckhardt, and now generally considered his work, is in a chapel of San Clemente, Rome. The subjects, representing episodes from the lives of SS. Ambrose and Catharine, and a Crucifixion, have been much repainted. "St. Catharine before the Philosophers" and the "Martyrdom of St. Catharine," with a remarkable landscape, are masterly presentations. The frescoes as a group seem earlier in date than those at Castiglione di Olona and there is much in them that reminds of Masaccio, to whom they have also been attributed. It seems indeed quite likely that Masolino was assisted here by his more talented pupil. This was unquestionably the case in the world-famous frescoes of the Brancacci Chapel, Santa Maria del Carmine, Florence. According to a tradition, dating from the time they were painted, Masolino received the commission but left it unfinished, and it was continued by Masaccio. The problem of the authorship is further complicated by the circumstance that they were finally completed by Filippino Lippi (q.v.). The principal subject of the frescoes is the "Lives of SS. Peter and Paul," and according to the best criticism, the following are by Masolino: "St. Peter Preaching"; "The Raising of Tabitha," "St. Peter Healing the Cripple," and the "Fall of Man." Compared with the adjacent productions of Masaccio they seem lacking in reality, power, and significance. Their author strives after ideal beauty rather than actuality. They show an abstract rather than a realistic beauty of line, imposing composition, and tender modeling. Among other subjects attributed to him are: a Gothic panel of the Madonna (1423) in the Kunsthalle, Bremen; a still earlier Madonna with God the Father and angels at Munich, two panels in the Naples Museum; "Christ in Glory" at Strassburg; an "Annunciation" at Gosford House, Scotland; frescoes of the "Pieta" in the Baptistery of Empoli, and of the "Madonna with Angels," in San Fortunato, Todi.

Bibliography. The principal monograph is by Toesco, *Masolino da Panicale* (Bergamo, 1908); also, A. H. Layard, *The Brancacci Chapel and Masolino, Masaccio, and Filippino Lippi*, published by the Arundel Society (London, 1868); Schmarsow, *Masaccio Studien* (Cassel, 1895-1900); Bernhard Berenson, "Quelques peintures méconnues de Masolino da Panicale," in *Gazette des Beaux-Arts*, ser. 3, vol. xxvii (Paris, 1902); id., in *Study and Criticism of Italian Art*, vol. ii (London, 1902); Crowe and Cavalcaselle, *History of Painting in Italy*, ed. by Douglas and Strong (New York, 1903); for data on the life of Masolino: Milanese, *Storia dell'arte toscana* (Florence, 1873).

MASON, ALFRED EDWARD WOODLEY (1865-). English novelist and politician, born at Dulwich and educated at Dulwich College and at Trinity, Oxford. From 1906 to 1910 he was a Liberal member of Parliament representing Coventry. He gained popularity as a novelist, his work including: *A Romance of Wastdale* (1895); *The Courtship of Morrice Buckler* (1896); *The Philanderers* (1897); *Parson Kelly* (1899), with Andrew Lang; *Miranda of the Balcony* (1899); *The Four Feathers* (1902); *The Truants* (1904); *Running Water* (1907); *At the Villa Rose* (1910); *The Witness for the Defense* (1911), a play; *The Turnstile* (1912); *Open Windows* (1913), a play; *Green Stockings* (1915), a comedy.

MASON, CHARLES (1730-87). An English
VOL. XV.—13

astronomer. He was employed as an assistant at the Greenwich Observatory from 1756 to 1760 and was sent with Jeremiah Dixon to the Cape of Good Hope in 1761 to observe the transit of Venus. In 1763 they were employed by the proprietors of Maryland and Pennsylvania to survey the boundary line between their respective possessions. The boundary fixed by them has since been known as "Mason and Dixon's line" (q.v.). They also fixed "the precise measure of a degree of latitude in America." The particulars of this work are recorded in vol. lviii of the *Philosophical Transactions*. Mason and Dixon returned to England in the autumn of 1768. In the following year Mason went to Cavan, Ireland, to observe the transit of Venus, his report of which appeared in the *Philosophical Transactions* for 1770. He was also employed by the Board of Longitude to verify the lunar tables of Tobias Mayer; these were published after his death under the title of *Mayer's Lunar Tables Improved by Charles Mason* (London, 1787). His private journal, field notes, etc., were found among a pile of waste paper in the cellar of the Government house at Halifax, Nova Scotia, in 1860, and an account of their contents was published by Porter C. Bliss in the *Historical Magazine* for July, 1861.

MASON, DANIEL GREGORY (1873-). An American composer and writer on music, born at Brookline, Mass. He graduated from Harvard University in 1895, studied music in Boston, New York, and Paris, and became assistant professor of music and extension lecturer at Columbia University. He composed an Elegy for piano (1901); Sonata for violin and piano (1912); Pastorale for violin, clarinet, and piano (1913); *Country Pictures* for piano (1913); and is author of *From Grieg to Brahms* (1902); *Beethoven and his Forerunners* (1904); *The Romantic Composers* (1906); *A Student's Guide to Music* (1909); *A Neglected Sense in Piano Playing* (1912); *Music as an International Language* (1913); *Guide to Music* (1914).

MASON, FRANCIS (1799-1874). An American missionary and Orientalist. He was born at York, England, came to the United States in 1818, entered Newton Theological Seminary in 1827, and in 1830 was sent as a missionary to Burma. His labors were chiefly among the Karens. Into two dialects of their language—Sgaw and Pwo—he translated the Bible and other religious books, and a seminary for the training of preachers and teachers was conducted by him. He published, in 1852, *Tenasserim, or the Fauna, Flora, Minerals, and Nations of British Burma and Pegu*, a second edition of which appeared under the title *Burma: Its People and Natural Productions* (1860; 3d ed. by Theobald, 2 vols., 1882-83). He also published, besides translations from the Burman, Pali, and Sanskrit: *Life of Ko-Thah-Byu, the Karen Apostle*; *A Memoir of Mrs. Helen M. Mason* (1847); *a Memoir of Sau Quala* (1850); *Pali Grammar on the Basis of Kachchayano, with Chrestomathy and Vocabulary* (1868); *The Story of a Workingman's Life, with Sketches of Travel* (1870), an autobiography.

MASON, GEORGE (1725-92). An American political leader of the Revolutionary period, born in Stafford (now Fairfax) County, Va. He was an intimate friend and neighbor of Washington, was a member of the Ohio Company, and as early as 1759 was a member of the Virginia Assembly. He was a leader of the opposi-

tion in Virginia to the Stamp Act, and in 1769 drafted the nonimportation resolutions, which were presented by Washington and adopted by the Assembly. At a popular meeting of the citizens of Fairfax County held July 18, 1774, he offered twenty-four resolutions on the issues between Great Britain and the Colonies in which were outlined both the nonintercourse policy with Great Britain and the scheme of a general intercolonial Congress. These resolutions were sanctioned by the Virginia Convention in August, and were reaffirmed by the Continental Congress in October of the same year. Mason served on the Virginia Committee of Safety, and occupied a seat in the Virginia Constitutional Convention of 1776. In the latter capacity he earned distinction as the author of the well-known Bill of Rights which constitutes so notable a part of the Virginia Constitution of 1776, and which was probably the most complete as well as the most advanced statement of the rights of man that had then appeared. In 1777 the Legislature, of which he was still a member, elected him to the Continental Congress; but he declined to serve and remained an active and influential member of the Legislature for many years. In 1780 he outlined a plan which was subsequently adopted by Virginia for ceding to the Federal government her claims to the territory north and northwest of the Ohio River. In 1787 he became a member of the Constitutional Convention at Philadelphia, and took an active part in the debates on the Constitution. He spoke against the provision for the continuance of the slave trade and disapproved of the instrument as a whole. He refused to sign it, and, with Patrick Henry in the Virginia Ratification Convention of 1788, threw his influence against ratification and proposed twenty alterations, some of which were afterwards adopted. He was chosen as one of the first United States Senators from Virginia, but declined to serve. With Madison and Jefferson, Mason carried through the Virginia Legislature measures disestablishing the Episcopal church and protecting all forms of worship. His death occurred October 7, 1792, at "Gunston Hall," and his statue, with those of other distinguished Virginians, stands in front of the State Capitol at Richmond. Consult Rowland, *Life and Writings of George Mason* (2 vols., New York, 1892).

MASON, GEORGE HEMING (1818-72). An English landscape and figure painter, born in Staffordshire. He first studied medicine, but afterward went to Rome, where he earned a living painting portraits, though he had had no regular artistic training. He returned to England in 1858. Mason's pictures represent English or Roman subjects, treated in an idyllic manner. They are softly harmonious in color, but lacking in vigor and truth to nature. Among the best are: "Ploughing in the Campagna" (1857), "Dancing Girls" (1868), "Harvest Moon" (1872), "The Cast Shoe," and "Wind on the Wold," the last two in the Tate Gallery, London.

MASON, JAMES MURRAY (1798-1871). An American lawyer and legislator, best known as one of the representatives of the Confederate government in Europe during the Civil War. He was born on Mason's Island, Fairfax County, Va.; graduated at the University of Pennsylvania in 1818, and practiced law for some time at Winchester, Va. He soon became prominent

in politics, and was a member of the Virginia House of Delegates from 1826 to 1832, of the Virginia Constitutional Convention of 1829, of the national House of Representatives from 1837 to 1839, and of the United States Senate from 1847 to 1861. Mason, having absented himself about March 20, during the session of the Senate for executive business, did not again take his seat. He was expelled by formal vote (July 11) at the special session of the Thirty-seventh Congress, which met under the call of President Lincoln, July 4, 1861. In Congress he was conspicuous as an upholder of slavery and as an ardent advocate of the principle of States' rights, and in 1850 he drafted and introduced the famous Fugitive Slave Law, which formed part of the compromise measures of that year. For ten years he was chairman of the Senate Committee on Foreign Affairs. Late in 1861 he was appointed commissioner of the Confederate government to England, and on the night of October 12 started from Charleston, S. C., with John Slidell, the Confederate commissioner to France; but having reached Havana about the twenty-second of October, he and Slidell were seized on board the British steamer *Trent* by Captain Wilkes of the United States ship *San Jacinto* and were confined at Fort Warren, Boston, until Jan. 2, 1862, when the United States government, yielding to the demand of England, ordered their release. Their seizure caused great excitement on both sides of the Atlantic and threatened to bring on a war between the United States and Great Britain. (See TRENT AFFAIR, THE.) After his release Mason proceeded to London, where he endeavored to win over the British government, and the British people as well, to the side of the Confederacy, but he was never received officially by the ministers, and in September, 1863, his commission was withdrawn. He, however, remained in Europe, spending his time principally in Paris and London and vainly attempting to induce France and England to intervene actively on the side of the Confederacy. Immediately after the war he returned to America. Fearing arrest at the hands of the Federal government, he lived in Canada until 1868, when he removed to Virginia and thereafter until his death lived near Winchester. Of Mason Mr. Charles Francis Adams has this to say: "He was in many, and by no means the best ways, a typical Virginian. Very provincial and intensely arrogant, his dislike of New England, and especially of Massachusetts, was pronounced and only exceeded by his contempt."

MASON, JEREMIAH (1768-1848). An American lawyer and legislator. He was born in Lebanon, Conn., graduated at Yale in 1788, was admitted to the bar in 1791, and began the practice of his profession at Westmoreland, N. H. He removed to Walpole, N. H., in 1794, and in 1797 to Portsmouth, which was his home for the next thirty-five years. He was soon recognized as the head of his profession in a State whose bar was unequalled in America and which could number among its members Ezekiel and Daniel Webster and Jeremiah Smith. He was appointed Attorney-General of the State in 1802 and was elected to the United States Senate in 1813. He became one of the foremost debaters in that body, his speech delivered in 1814, on the Embargo, being especially powerful; but in 1817 he resigned his seat to continue the practice of his profession. He afterward served for a number of terms in the New Hampshire Legis-

lature, where his service had little connection with politics, but was given largely to revising and codifying the State laws. In 1832 he removed to Boston, where, until his age compelled him to retire, he maintained the high reputation which he had previously won.

MASON, JOHN (1586-1635). The founder of New Hampshire. He was born at Lynn Regis, Norfolk, England; served in 1610 in the navy; in 1616 went to Newfoundland as Governor of the colony, and in 1620 published a description of the country, to which he added a map in 1626. He explored the New England coasts in 1617; in 1622 obtained a grant of a region called Mari-ana, now the northeastern part of Massachusetts; in the same year, in connection with Sir Ferdinando Gorges, procured a patent for the Province of Maine; and in 1623 sent a colony to the Piscataqua River. In 1629 he obtained a patent for the New Hampshire colony, and with Gorges took one also for Laconia, a region including Lake Champlain. He held various honorable positions in England: in 1625-29 he was treasurer and paymaster of the English army engaged in war against France and Spain; in 1632 he was made vice president of the Council for New England; and in 1635 he was a judge in Hampshire and vice admiral of New England. His rights in New Hampshire were sold in 1691 to Governor Samuel Allen. He died in London in December, 1635, and was buried in Westminster Abbey. Consult Tuttle, *Memoir of Captain John Mason, the Founder of New Hampshire*, in an illustrated edition of Mason's tract on Newfoundland, published for the Prince Society (Boston, 1887).

MASON, JOHN (1600-72). An American Colonial commander. He was born in England; served under Sir Thomas Fairfax in the Netherlands; emigrated in 1630 to Dorchester, Mass.; in 1633 obtained a military command at Boston; and in 1635 aided in founding Windsor, Conn. In 1637 he was placed in command of a small force of English and Indians sent against the Pequots (q.v.). After the destruction of that tribe Mason removed to Saybrook, at the request of the inhabitants, for the defense of the Colony. In 1651, when New Haven attempted to found a settlement on the Delaware, it was proposed to put Mason in command, but the General Court at Hartford would not consent to his removal from Connecticut. In 1659 he removed to Norwich. He was a major of the Colonial forces for thirty years, Deputy Governor of Connecticut in 1660-70, and chief judge of the Colonial court from 1642 to 1668. He prepared, at the request of the General Court of Connecticut, a *Brief History of the Pequot War*, which was incorporated by Increase Mather in his *Relation of Trouble by the Indians* (Boston, 1677, republished with introduction by the Rev. Thomas Price, Boston, 1736). Consult G. E. Ellis, "Life of John Mason of Connecticut," in Jared Sparks, *Library of American Biography*, vol. xiii (Boston, 1864).

MASON, JOHN (1858-1919). An American actor, born at Orange, N. J., and educated at Columbia University. He made his first regular appearance on the stage at the Walnut Street Theatre, Philadelphia, in 1878. The next year he joined the company of the Boston Museum, and remained there four years, playing leading parts. For the next ten years he was connected with various companies, playing a great variety of rôles and greatly increasing his ability as

an actor. He made his first appearance abroad at the St. James's Theatre, London, in 1891, scoring a decisive hit as Simeon Strong in *The Idler*. In 1900 he joined Daniel Frohman's company at Daly's Theatre, New York, appearing in *The Ambassador*, *The Interrupted Honey-moon*, *The Man of Forty*, and *Lady Huntsworth's Experiment*. He was leading man with Mrs. Fiske in 1905, playing, among other parts, Lövborg in *Hedda Gabler*, and Paul Sylvaire in *Leah Kleschna*. During 1906 he appeared in *The Liars*, *The Tyranny of Tears*, and various other successful plays. In the next year he scored a great success as Jack Brookfield, the gambler, in Augustus Thomas's *The Witching Hour*. Subsequently he appeared in Thomas's *As a Man Thinks* (1911), Bernstein's *The Attack* (1912), a revival of *Liberty Hall* (1913), and *Big Jim Garrity* (1914).

MASON, JOHN YOUNG (1799-1859). An American politician, born at Greensville, Sussex Co., Va. He graduated at the University of North Carolina in 1816, and in 1819 was admitted to the bar. After serving as a member of the Virginia Assembly and as a delegate to the Virginia State Constitutional Convention of 1829, he was a member of Congress from 1831 until 1837. When in Congress he was chairman of the Committee on Foreign Affairs. He next served as judge of the United States District Court for Virginia from 1837 until 1844, when President Tyler made him Secretary of the Navy, an office which he retained until Tyler's death. He entered the cabinet of President Polk as Attorney-General, but in 1846 again took up the portfolio of the Navy, which he held for three years. In 1853 President Pierce made him Minister to France, where he remained until his death. On Oct. 10, 1854, he met Buchanan and Soulé, the ministers of the United States to England and Spain, respectively, in a conference at Ostend, and in conjunction with them issued the famous Ostend Manifesto (q.v.).

MASON, SIR JOSIAH (1795-1881). An English manufacturer of pens. Born at Kidderminster, he began selling cakes in the streets when only eight years old, and later taught himself to read and write while serving as shoemaker's apprentice. He tried his hand at various trades, and finally in 1824 he set up as a manufacturer of split-steel key rings, for which he had invented special machinery. He began manufacturing steel pens in 1829, and rapidly developed an immense business, which he sold to a limited liability company in 1875. He added to his fortune by gold and silver plating in connection with the Elkington Brothers, and by copper and nickel smelting works. Between 1858 and 1868 he built up a great orphanage at Erdington at a cost of nearly \$1,500,000, and for this he was knighted in 1872. He also gave more than \$1,000,000 to endow Mason's College (now part of the University of Birmingham), which was opened in 1880. Consult J. T. Bunce, *Sir Josiah Mason: A Biography* (London, 1882).

MASON, LOWELL (1792-1872). An American music teacher, born in Medfield, Mass. When only 16 he directed a church choir at Medfield and upon his removal to Savannah continued his interest in musical affairs. In 1827 he returned to Boston, where he became president of the Handel and Haydn Society and strongly advocated the Pestalozzi system of teaching. He founded the Boston Academy of

Music (1832), and in 1837 went to Germany to study musical pedagogic methods. He is remembered chiefly for his numerous hymn tunes, which are still in general use throughout the country, and his collections of songs: *Boston Handel and Haydn Collection of Church Music* (1822); *Juvenile Psalmist* (1829); *Lyra Sacra* (1837); *The Sabbath Hymn and Tune Book* (1859), with E. A. Park and Austin Phelps; *The Psalter* (1845); *Carmina Sacra* (1841); *New Carmina Sacra* (1852).

MASON, OTIS TUFTON (1838-1908). An American ethnologist, born at Eastport, Me. He graduated in 1861 at Columbian (now George Washington) University and was principal of the preparatory school of the university (1861-84). He became curator of ethnology in 1884, and head curator of the department of anthropology in 1902, in the United States National Museum. Mason founded the Anthropological Society of Washington; was anthropological editor of the *American Naturalist* and of the *Standard Dictionary*; and wrote, besides many reports published by the government: *Summaries of Progress in Anthropology*; *Woman's Share in Primitive Culture* (1894); *The Origin of Inventions* (1895); *Indian Basketry* (2 vols., 1904). He was a contributor to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

MASON, WILLIAM (1724-97). An English divine and poet, born probably at Kingston-upon-Hull. He was educated at Cambridge, and in 1749 became a fellow of Pembroke College. He was appointed rector of Aston in Yorkshire, and chaplain to the Earl of Holderness in 1754. The next year he visited Germany, and in 1757 was appointed chaplain in ordinary to the King. Subsequently he was for more than thirty years preceptor and canon residentiary of the cathedral at York. Among his writings are *Musæus* (1747), a monody to the memory of Pope; *Isis* (1748), a monologue denouncing the Jacobitism of Oxford; and the dramatic poems *Elfrida* (1752) and *Caractacus* (1759). He also wrote a number of odes in imitation of his friend Gray, of whom he published a *Life* in 1774. The first book of *The English Garden* appeared in 1772, and in 1782 he published a *Critical and Historical Essay on Cathedral Music*. His collected works were issued in 1811. A tablet to him was erected in the Poets' Corner of Westminster Abbey.

MASON, WILLIAM (1829-1908). An American musician, born in Boston. After having studied music in Europe with Hauptmann, Moscheles, Richter, Dreyschock, and Liszt, he appeared as a pianist in Prague, Frankfurt, Weimar, and London, and upon his return to the United States made several successful tours. In 1855 he settled in New York, and founded there the Mason and Thomas recitals of chamber music, which were continued until 1868. After 1855 he devoted himself almost entirely to teaching and composing. His works include numerous compositions, mostly for the pianoforte, but he is best known for his textbooks: *A Method for the Pianoforte* (1867), *System for Beginners* (1871), both in collaboration with E. S. Hoadley; *Touch and Technique* (1878); *A Primer of Music* (1894); and his interesting *Memories of a Musical Life* (1901).

MASON, WILLIAM PITT (1853-). An American chemist, born in New York City. He graduated at Rensselaer Polytechnic Institute (C.E., 1874; B.S., 1877), and studied medicine

at Union University (M.D., 1881), and bacteriology at the Pasteur Institute in Paris. At Rensselaer he was an assistant from 1875 to 1893, and thereafter professor of chemistry. His works include: *Examination of Potable Water* (1890); *Water Supply* (1896; 3d ed., 1902); *Notes on Qualitative Analysis* (1883; 5th ed., 1908); *Examination of Water* (1899; 4th ed., 1913).

MASON AND DIXON'S LINE. The boundary line between the States of Maryland and Pennsylvania, as run by two English surveyors, Charles Mason and Jeremiah Dixon, during the years 1763-67, and popularly accepted prior to the Civil War as the dividing line between the free States and the slave States. The line is that which was agreed upon in the settlement of a dispute between the States of Maryland and Pennsylvania over their respective boundaries as described in their charters. The chief controversy turned upon the meaning of the phrases "the beginning of the 40°" and "the beginning of the 43° of N. Lat." employed in the description of the Pennsylvania boundary. The quarrel, in which Lord Baltimore and Penn soon engaged, continued for more than eighty years; was the cause of much trouble between individuals; and occupied the attention of the proprietors of both provinces, the Lords of Trade and Plantations, the High Court of Chancery, and the Privy Councils of three kings. No compromise was reached during the life of Penn, but after his death his sons succeeded in obtaining from Charles, Lord Baltimore, in 1732, an agreement by which the boundary line was to be drawn by commissioners representing both parties to the controversy. Baltimore at once came over with his commissioners, but on becoming dissatisfied with the agreement he prevented its immediate execution. The unsettled condition of the boundary, therefore, continued and with it increasing disturbances in the disputed territory. The Governor of Maryland then laid the matter before the Proprietary and the King, and invoked their intervention for the settlement of the dispute. By an Order in Council the King commanded both sides to keep the peace and instructed the Proprietaries to grant no lands in the disputed territory until the boundary could be adjusted. Pending a decision of the question by the English Court of Chancery, to which the matter was submitted in 1735, both parties agreed upon a provisional boundary. A decision was finally reached in 1750 by the Chancellor, Lord Hardwicke, which, with the agreement of 1732, served as the basis of a compromise between the proprietors in 1760. Commissioners representing both sides were appointed, and the eastern boundary was determined. To run the east and west line, as well as other parts unsettled, Mason and Dixon were appointed in 1763, and at once entered upon their task. By the year 1767 they had carried the line over the mountains to a point 244 miles from the Delaware River. Farther advance was stopped by the Indians, but the line was subsequently completed by others. The boundary was marked by milestones, every fifth one having the arms of Baltimore engraved on one side and those of Penn on the other. Its exact latitude is 39° 43' 26.3" North. A resurvey of the line was made in 1849. Between 1901 and 1903 another resurvey was made by the States of Pennsylvania and Maryland. The work was placed under the direction of the commission consisting of the Superintendent of the

United States Coast and Geodetic Survey, the Secretary of Internal Affairs of Pennsylvania, and the Director of the Geological Survey of Maryland.

MASON BEE. A bee of the subfamily Osmiinae of the family Megachilidae; especially in the United States one of the genus *Osmia*, and in Europe one of the genus *Chalicodoma*. The name is derived from the manner in which these bees construct small earthen cells, sometimes mixed with sand, pebbles, and wood scrapings, glued together so firmly that they are smooth inside. Ten to twenty of the cells are usually found together, and each one contains a store of honey and pollen for the larvæ, only one of which is found in each of the cells. These bees show a high order of intelligence in the manner in which they adapt themselves to circumstances, and this accounts for the very great diversity seen in the situations in which the cells are placed. *Ceratostomia lignivora* is a true wood borer. Certain species excavate the pith of brambles, alternately widening and contracting the burrow to correspond with the proposed cells and the intervals between them. Others use the hollows of reeds and straws; two European species utilize the empty shells of several species of *Helix*, compactly filling each shell with their cells, which are placed in different relative positions according to the exigencies of the case, and then carefully closing the entrance with pellets of clay, sticks, and pebbles; others again plaster their cells thickly upon the underside of a flat stone which is slightly raised from the ground; and still another species places its cells in comparatively unprotected situations at the roots of grass. The *Chalicodomas* make very perfect masonwork in the walls of their cells.

The food stored up in the cells is composed of a mixture of honey and pollen. Réaumur and Fabre experimented with the young bees to find whether they were able to overcome additional difficulties in making their way out of the cell. When the mouth of the cell is covered with earth and pith or brown paper put in contact with the covering of the cells, the bees make their way out without any great apparent difficulty, but when some space intervenes between the mouth of the cell and the new barrier, the bees are unable to gain their freedom. The Osmiinae are of comparatively small size, and are usually of dark metallic colors. The eggs are white, oblong, and about the size and shape of a caraway seed. They hatch in about eight days. Development of the larvæ is rapid; they spin delicate cocoons and winter as pupæ.

MASON CITY. A city and the county seat of Cerro Gordo Co., Iowa, 72 miles northeast of Fort Dodge, on the Chicago Great Western, the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Chicago, Rock Island, and Pacific, and other railroads (Map:

Iowa, D 1). The city has a public library, a fine courthouse, hospitals, and two city parks, and is the seat of the National Memorial University and of an Odd Fellows' Orphans' Home. Its population is increasing rapidly, and it enjoys considerable industrial and commercial prosperity. There are important agricultural, grain, and live-stock interests, and a wholesale trade in groceries, fruits, etc.; also sandstone quarries, extensive cement, brick, and tile works, flour mills, lime works, sash and door factories, gasoline-engine factory, a large packing house, and foundries. Mason City, settled about 1855, adopted the commission form of government in 1913, the power being vested in a mayor and two commissioners. The city owns and operates the water works. Pop., 1900, 6746; 1910, 11,230; 1914 (U. S. est.), 13,495; 1920, 20,065.

MA'SONRY. The art and trade of construction in stone. The term is also somewhat loosely used of work in brick or concrete. It is the fundamental art in building and engineering work, even where a framework of wood or iron is used for a large part of the superstructure, and has been practiced from the earliest antiquity. The masonry of the ancient Egyptians is extraordinary, whether we consider the size of the materials, or the unequaled exactness with which they are fitted together without the use of mortar. Cyclopean or polygonal masonry, of which remains exist in many parts of Greece and Italy, as well as Asia Minor, also exhibits stones of great size with carefully adjusted joints. The walls of Mycenæ and Tiryns are among the earliest examples. They are built with huge irregular blocks, the spaces between being filled up with smaller stones. The ancient Italian masonry is usually more carefully executed. In some cases the beds or horizontal joints are made level and the upright joints left unsquared. No mortar is used in cyclopean masonry.

The masonry of the Greeks of historic times was usually of carefully coursed and squared blocks, equal, at its best, to the finest Egyptian work. Many of the Roman buildings in the East were constructed with blocks of enormous size, as at Baalbek (q.v.) in the second century, where some of the stones are 60 feet in length. But the typical Roman system was that of masses of cemented rubble or coarse concrete between facings of brick or of marble ashlar, or, in more ordinary work, of small blocks of tufa set cornerwise (*opus reticulatum*). Such walls were stuccoed on their interior faces. Roman vaulting was executed in masonry of cut stone, brick, or concrete, according to circumstances.

The mediæval builders of western Europe carried masonry in stone to a high pitch of both scientific and artistic perfection, using rubble and random ashlar in preference to coursed ashlar, and producing with stone of moderate size edifices of extraordinary impressiveness. The perfection of their cutting of moldings and of ornament rivals that of the finest Greek work.

Modern stone masonry involves the labors, after the quarrying, of the *stonecutter* who hews the stones into shape (often at a stone-yard or shed far from the building), the *mason* who lays them in place, and the laborer or *helper* who brings the mortar when mixed. A *carver* or sculptor carves the ornamental work. Masonry is classified according to the treatment of the exposed surface into quarry-faced, pitch-

faced, and dressed. *Quarry-faced masonry* is that in which the faces of the stones are left as they come from the quarry; it is used chiefly for massive engineering works and basements of large buildings. *Pitch-faced masonry* is that in which the face of the stones is rough but the edges are dressed to straight lines. *Dressed masonry*, as the name indicates, is that in which the face of the stones is dressed to a more or less smooth plane surface; it may be hammered, tooled, smooth-rubbed or polished. *Range masonry* is that in which the horizontal joints or courses are continuous throughout. *Broken-range masonry* is that in which the horizontal joints are not continuous throughout, so that a portion occupying a given height in two courses may abut against another having one or three courses in the same height. *Ashlar masonry* is masonry of carefully squared blocks, as distinguished from that of blocks not squared at

ASHLAR MASONRY.

the ends. In the finest work all the blocks are of the same size, the length usually twice or thrice the height, and the vertical joints of each course centred under the blocks of the next. In the figure, *a* shows hammered ashlar with tooled or chisel draft; *b*, pitch-faced ashlar. *Random*, or *random-coursed*, ashlar is masonry of squared stones of various sizes, laid without continuous horizontal beds. (The American usage which would confine the term ashlar to mere facings of cut stone is inaccurate.) *Rubble masonry* is that composed of unsquared stone, laid with or without an attempt to approximate regular courses.

Some of the other current definitions of stone-masonry work are as follows: *Face*, the front surface of a wall; *back*, the inside surface; *facing*, the stones which form the face of a wall; *backing*, the stones which form the back of a wall; *filling* or *core*, the material between the inner and outer facings, or between the backing and facing, in very massive work; *batter*, the slope of the surface of a wall; *course*, a horizontal layer of stone in a wall; *joints*, the meeting surfaces of the stones (the horizontal joints are called *beds*); *coping*, a course of stone on the top of the wall to protect it; *quoins* are squared stones, alternately long and short, forming the corners of buildings or projecting wings; *pointing*, a finishing of the visible joints with fine mortar; *bond*, the arrangement of stone in adjacent courses; *stretcher*, a stone whose greatest dimension lies parallel to the wall; *header*, a stone whose greatest dimension lies perpendicular to the wall; *dowels*, pegs set in holes in adjacent faces of two stones to prevent slipping; *cramps*, bars of iron having the ends bent to enter holes in the upper surfaces of adjacent stones.

Ashlar masonry is used for, works in which

great strength or a finished and elegant effect is required. The thickness of the mortar joints in the very best class of ashlar masonry for building purposes is about $\frac{1}{8}$ inch; for railway and bridge masonry about $\frac{1}{4}$ inch to $\frac{1}{2}$ inch. The arrangement of headers and stretchers varies; the strongest arrangement is where a header and a stretcher are used alternately. Dowels and cramps are used where exceptional strength is required. Ashlar masonry is usually backed with rubble masonry, brickwork, or concrete, the backing being built simultaneously with the facing. In certain classes of stone masonry, such as bridges and architectural work of importance, the stones are cut to exact dimensions and to special forms. In lighthouse construction these special forms are sometimes quite intricate. See LIGHTHOUSE.

Rubble masonry is employed for backing ashlar, for rustic work, and other uses not requiring great strength or elegant finish. The stones are prepared for laying by simply knocking off the weak corners and loose pieces. All interstices are filled with small pieces of stone and mortar, and the mortar joints are made thick enough to prevent adjacent stones from touching. Very often rubble masonry is laid without mortar, and is then called dry rubble masonry.

A highly important and refined branch of masonry is that of arches and vaults, not only in bridges and tunnels, but in monumental architectural works, as in the superb vaults of the mediæval cathedrals and churches and some modern works. This kind of masonry involves the application of the geometric science or art of *stereotomy*, or *stonecutting*, for the preparation of *tablets* or patterns of each face of each stone used. See STEREOTOMY; VAULTING.

The excellence of masonry depends on the quality of the stone and of the mortar and the care with which the stones are cut, laid, bedded in mortar, and bonded. Not only must the exposed face of each stone be correctly shaped, but the *beds*, or horizontal surfaces of the top and bottom, must be dressed to a true plane for a sufficient depth from the face. The mortar may be of sand and lime; of sand, lime, and cement; of sand and cement; or, in hydraulic work, of pure cement; properly proportioned and mixed, and so applied as to fill all interstices between the stones. In the finest work the visible joints do not exceed $\frac{1}{8}$ inch in thickness; in heavy, rustic, and engineering work they may be much thicker. The strength of masonry (or the safe load it will carry) varies from 10 tons per square foot for ordinary rubble to 25 or 30 tons for the best granite ashlar.

There are, besides the common kinds of masonry described above, various special forms, especially in English work. In *herringbone* masonry long thin slabs of stone, or bricks, are laid obliquely in courses having the slope or inclination alternately reversed. *Boulder* masonry is that which is composed of large, rounded field stones or boulders laid up without cutting, as in rustic walls and basements. *Flint rubble* is a finishing of the face of a rubble wall with a heavy coat of mortar in which white flint stones are set as closely as possible. *Rustic* or *rusticated* masonry is a form of ashlar having the joints deeply cut or beveled, or the body of the block in strong relief with a depressed border or draft around it.

Brick Masonry. With due allowance made for the difference of the material and dimensions,

brick masonry corresponds very closely to dressed ashlar masonry. The bond used is varied considerably, but is usually either the English bond or the Flemish bond. (See BRICKWORK.) The mortar used in brickwork may be either lime mortar or cement mortar, the former being most used in ordinary building. Brickwork should carry safely a load of 20 tons per square foot when laid in lime mortar.

Concrete Masonry. Concrete masonry, strictly speaking, signifies blocks of concrete laid like stone masonry. The term is, however, sometimes loosely applied to monolithic or massive concrete formed while plastic in temporary molds, especially when used in connection with true masonry of stone or brick. For the various processes of building in concrete, see CONCRETE. In English usage, and to some extent in the United States, the terms "masonry," "masonry-work," and "mason" are exclusively applied to work in stone. Masonry of brick is "brickwork" and "bricklaying," and a brick mason is a "bricklayer." As these trades are distinct in the United States, as in Great Britain, good usage warrants the general observance of a like distinction in the use of these terms here. For a comprehensive treatise on masonry work, consult: I. O. Baker, *Treatise on Masonry Construction* (10th ed., New York, 1909); F. E. Kidder, *Mason's Work* (9th ed., ib., 1909); W. F. Patton, *A Practical Treatise on Foundations* (2d ed., ib., 1909). See BUILDING; BRICK; CEMENT; CONCRETE; MORTAR; QUARRY; STONE CUTTING AND DRESSING; STONE, ARTIFICIAL.

MASONS. The Masonic fraternity, variously referred to as ANCIENT FREE AND ACCEPTED MASONS, or FREE AND ACCEPTED MASONS. It is the largest, oldest, and most widely distributed secret society in the world. Lodges of Masons are found in every civilized country except Russia, where, for obvious political reasons, the society, although it took root there at times, has never flourished. Accurate totals of membership from all foreign countries are unavailable. Those for the United States are official. Of the approximately 2,348,000 active members in the world, 67 per cent are in the United States, about 23 per cent are in Europe, and 16 per cent in the United Kingdom.

Freemasonry as known to-day is an English creation and dates back only to London in 1717. Comparatively few of the lodges of Masons in the United Kingdom have been traced back for 100 years prior to 1717; beyond that definite record of their existence is lost. They come down, of course, in a general way in English history as operative (stone) mason lodges, survivals of the guilds which built churches, cathedrals, and bridges during the Middle Ages. Volumes have been written in efforts to trace the origin of Masonry, an organization evolved from a few surviving mason lodges in England and Scotland a little more than 200 years ago. The story of its origin being at the building of King Solomon's temple and that it has had an uninterrupted existence since, is a myth.

Owing to the completion of the era of church and cathedral building throughout Europe 300 years or more ago, and to the results of the Reformation and the Thirty Years' War, there were comparatively few surviving guilds of stonemasons and builders, which during the Middle Ages had traveled through Europe, originally under the patronage of the Church. The latter had conferred privileges on them,

hence free masons. The guilds in England have a manuscript record that a general assembly of masons was held at York, under the patronage of Edwin Athelstan, where a code of laws was adopted which, as alleged, became the foundation of later Masonic constitutions. Traveling guilds of builders held a general assembly at Strassburg in 1275, and again in 1375, at which a fraternity was formed with apprentices, craftsmen, and masters among the members, and with an initiatory ceremony and a sign—perhaps the first traveling operative Freemasons, under protection of Church and State.

With the decline of church building the guilds gradually disappeared. In France guilds which were the outcome of the colleges of artificers accompanying the invasion of the Roman legions were abolished in 1539. A later French builders' fraternity, called the Companionage, possessed a remarkable legend of the death of the master builder, which modern Masons will be interested to learn antedated the establishment of modern Freemasonry at London in 1717. The Roman occupation of northern Europe naturally left an influence on the mason guilds of Germany, France, and Britain, but the German and French guilds disappeared between 1500 and 1600. From some time prior to 1600, until early in the eighteenth century, surviving British mason guilds began to accept as members persons not operative masons or workers, whence Free and Accepted Masons. This, whether the result of a fad or not, brought many distinguished and well-to-do men into the fraternity (1660-1700), after which the so-called work of the lodges was only in the symbolism of the labor performed by earlier masons. From this came speculative in contrast with the operative masons.

When four surviving old lodges met in London in 1717 and formed a Grand Lodge there was but one degree of Masonry. By 1724 the three degrees of entered apprentice, fellowcraft, and master mason were all in the ritual and have constituted ever since what has been called universal Masonry, the possession of which everywhere has been a prerequisite to membership in all later Masonic rites.

Keen search has been made by Masonic historians for an explanation of the world range, down through the ages, of the symbols found in the rituals of Freemasonry. A large part of the collection is attributed to the research and ingenuity of antiquarians and other learned men who, late in the seventeenth century, made the mystical ornamentation for the surviving mason guilds in England, and this was supplemented by an effervescence of activity in this direction immediately after the original Grand Lodge of England was formed at London in 1717.

The Essenes of the first three centuries perfected the kabbala, of which there is a suggestion in Masonry. The Culdees, apostolic monks of Eastern origin, found later in Britain, were drawn on for early architecture. Elias Ashmole, eminent antiquarian, one of the early "accepted masons," was a Rosicrucian, and as that cult did, so Masonry displays the double and single triangles, a point within a circle, and the hexagon. From the mason guilds were derived the square and compasses, King Solomon's temple and its two pillars, St. John the Baptist, the five, seven and nine, and various words, grips, and signs. Whether it was the triangles or the lion of the Gnostics, it may be noted that these all appeared after the accession of antiquarians

¶ Probably very much understated. Unsettled conditions prevent full reports.

and historians, Englishmen in professional, literary, and scientific life who became the accepted masons and who devised the symbolic building, the second temple, "a house not made with hands," etc.

Thus symbolic Freemasonry now presents that which suggests a dipping into almost all the mystical schools of philosophy and religion, pagan and Christian, by the operative masons of the Middle Ages; also into the Vehmgerichte, or German Society of Free Judges of the thirteenth century, and into the symbolism and teachings of the Pythagoreans, on top of all which must be included the legend of the master's degree as by far the most impressive feature, the pinnacle of dramatic symbolism placed on the English or symbolic rite about 1725. Whether it was dug up and borrowed from the archives of the French Companionage, successor to French mason builders of the Middle Ages, may never be known. If it is not, the coincidence is one of the most remarkable recorded.

Thus upon the bare skeleton of a secret brotherhood, which only tradition said had come down through the ages, was lavished a wealth of mystical symbolism gathered from the records of creations of man's religious and ethical aspirations. The supply of raw material was so abundant that, after the impulse given the work of upbuilding Freemasonry which culminated in 1717-25, when the three symbolic degrees, or "blue-lodge" Masonry, were perfected, a second period of elaboration of the possibilities of Masonic degrees and rites marked the remainder of the eighteenth century. This era in which Masonic degree factories were operated overtime extended in reality from late in the seventeenth century to early in the nineteenth. As each new degree or rite appeared, in England or on the Continent, the framers with rare judgment made eligible to membership only those who had received the original or first three degrees of Masonry. Thus, though rites have come and rites have gone, whatever the value or status of the added grades or degrees, the only genuinely universal Masonry continues to be the three degrees of entered apprentice, fellowcraft, and master Mason.

Within 10 years after the four remaining Masonic lodges in London had formed the Grand Lodge of England in 1717, organized Freemasonry had spread throughout the United Kingdom, to the Continent of Europe, and to many British colonies, including, in 1730, those in America. Thus began what has been called the revival of Freemasonry, its historic period, in which the international spread of the formation of lodges was greatly aided by vogue which the fraternity had acquired in England. Through British army and navy lodges, and by coöperation from Masons, members of the British diplomatic service abroad, Masonic lodges sprang up within a few years in almost all quarters of the world.

The first grand master of the newly formed Grand Lodge of England was Anthony Sayre, followed by George Payne in 1719 and by Dr. John Theophilus Desaguliers in 1719. Payne succeeded to the office in 1720, in which year the general regulations for the craft were compiled. These were revised by Dr. Desaguliers and Rev. James Anderson, a Scottish Presbyterian clergyman, and published in 1723 under the title of *Charges of a Freemason*. Prior to 1717 lodges met when and where desired, elected a master

for the communication, and did Masonic work. After the Grand Lodge was organized lodges were created by warrant, elected permanent officers, and met at stated locations. The fraternity then took on the distinct characteristics for which it has since been known. Requisites for admission were and are a belief in a Supreme Being and in the immortality of the soul, under which Christians, Jews, Mohammedans, Indians, and others who are believers in a God are eligible to membership. No atheist can become a Mason.

The Mason is instructed that his fraternal obligations involving aid or assistance to members are to be subordinated to the duty he owes to God, his country, and his family, with full recognition of the duty he owes to his fellow men. The fraternity differs radically from the secret, beneficiary (insurance or other) societies, and from the Independent Order of Odd Fellows, the next largest secret, international fraternal association, in that its measure of relief or charity extended among members is purely voluntary, dependent on the need in each individual case. It is in no way part of a contract or other understanding that such-and-such distress on the part of brethren shall call for specific financial or other recognition or care.

The craft in England as well as on the Continent was early patronized by royalty, which gave it a distinction gained then or since by no other like society.

In 1724 a Grand Lodge of all England was formed by an old lodge at York, which claimed to date from the assembly of Masons said to have been held there in the year 926. It, however, maintained friendly relations with the Grand Lodge of England in 1717, and died a natural death in 1792. In 1751 nine lodges, chartered by the Grand Lodge of England, seceded, charging that the Grand Lodge of 1717 had departed from some of the old landmarks. It has ever been a Masonic law that the landmarks may not be changed. These formed a Grand Lodge of England according to Old Institutions, and styled themselves Ancients and called the original Grand Lodge adherents Moderns. Then followed the historic Masonic schism, which continued until the reunion of 1813 in the United Grand Lodge of Ancient Freemasons of England. The leader of the Ancients was Laurence Dermott, who published the *Ahiman Rezon*, or *Book of Constitutions*, virtually a copy of the constitutions of the original Grand Lodge of England. This he addressed to the Ancient York Masons of England. The Dermott grand lodge was relatively the more active in propagating lodges abroad, and difference in its work explains some of the striking variations in lodges in various States in America.

Permanent Masonic union in England in 1813, under the Duke of Kent as Grand Master of the Ancients and the Duke of Sussex as Grand Master of the Moderns, forever laid the controversy. Masonic students and historians present evidence that the degree known as the holy royal arch was originally the second (or third) section of the master's degree; that it was cut off and expanded by the Ancients, and that at the reunion of 1813 it was adopted and authorized to be conferred on master Masons. In the United States, the Dominion of Canada, and the Maritime Provinces the royal arch degree is made the summit of the caputular rite of four degrees conferred on master Masons who may be elected to receive it.

In England the royal arch is conferred in chapters of royal arch Masons governed by a Supreme Grand Chapter. The mark master's degree, distinctively English, a detached ceremonial, is conferred on master Masons in mark lodges, governed by a Grand Lodge of Mark Masters; and the Order of the Temple, associated with Knight Templar traditions, is conferred in priories of Knights Templars, governed by a Great Priory.

There was never any connection between Freemasonry and Templary or Malta knighthood, other than in Masonic legends which told of the Crusaders, after their return from Palestine, taking refuge among Masons and bequeathing their rites to the latter. This idea was fostered in an address in 1737 by Chevalier Ramsey, a Scotchman who became a Mason at London in 1728. This was the period in which degree making was rampant and Templar and Malta chivalric grades were common in the French, Scottish, and other systems. The old Baldwin Encampment degrees at Bristol, long called the basis of the English Templar degrees, have not been traced back of 1779. By 1745 Masonic Templary, originating in the fertile minds of Masonic degree makers and dressed in the historical atmosphere of Knights of the Temple and Malta, ran across Europe and, through English and Irish Grand Lodge influence, into the American colonies. These degrees have ever been among the most popular in all rites into which adopted. This is partly explained by their trinitarian Christian character. As none but professing Christians among royal arch Masons are eligible, these degrees naturally fill a want left after English symbolic Masonry, which was originally trinitarian Christian, became unitarian and cosmopolitan. There are only about 6500 Knight Templars in the United Kingdom and Ireland.

The English Masonic menu also includes the Ancient Accepted Scottish rite degrees, which are under the administration of a Supreme Council and may be conferred on master Masons. In Scotland the statutes and ordinances of the Mason craft at the close of the sixteenth century, as outlined by William Shaw, general warden and his Majesty's master of work, were concerned mostly with trade relations. There was a password, but no degree or ceremonial. In 1736, through the efforts begun by Desaguliers 15 years before, various Scottish Mason lodges were interested and a Grand Lodge of symbolic Masons for Scotland, as well as provincial grand lodges, were formed. A gradual affiliation of remaining Scottish Mason lodges followed. Symbolic Freemasonry was introduced from England into Ireland in 1730. It met with some opposition from the Roman Catholic church, but the fraternity there expanded proportionately compared with elsewhere.

The first Masonic lodge in France was established at Dunkirk in 1721. It had an English charter, as, for that matter, did the first lodges in Spain, Germany, Netherlands, Austria, Greece, Turkey, Russia, Italy, Portugal, India, China, South Africa, Japan, and the American Colonies. The second French lodge was established at Paris in 1725. It also was of English origin, but fell under the ban of the Church and became social rather than Masonic in its aims. A Grand Lodge for France was formed in 1736, after which the strength of the fraternity there was marked with a riot of activity in the crea-

tion of new degrees and rites, most of which soon fell into disuse. In 1766 a National Grand Lodge of France was formed, since 1772 called the Grand Orient. Antagonism between the original Grand Lodge and the Grand Orient brought confusion, the latter using some superimposed Scottish rite degrees with the three symbolic degrees from England, while the earlier grand body was carried off for a time by the mystical creations of the notorious Cagliostro. With the revolution of 1793 both these grand bodies suspended, but in 1799 they were revived and united as the sole governing Masonic body in France. Then came another war of rituals between the Scottish philosophical and the new Ancient Accepted Scottish rite, imported as a novelty from the United States, and the fraternity in France was rent again. Union of the Grand Orient and the newly formed Supreme Council followed in 1804, when the American-created Scottish rite of 33 degrees was officially introduced, the two grand bodies sharing in its administration. The Grand Orient, it was claimed, broke the concordat in 1814, and assumed control of all the Scottish rite degrees, which brought on war with the Supreme Council. Political conditions owing to Bonapartist membership rendered the Supreme Council dormant until 1821, when it placed the first three degrees under dominance of a Grand Lodge of France, a Scottish rite protégé. The Grand Orient, having removed the name of the Deity from its lectures and the Bible from its altars, is not recognized by Masonic grand bodies which hold to the ancient landmarks.

Between 1725 and 1775 scores of so-called higher Masonic degrees were invented, some grouped into systems or rites. Many of these were hawked about the Continent by charlatans and others, in some instances as a means of livelihood. It was in France, too, that the earlier "Scottish" degrees were invented, so called to secure a distant birthplace where there were immemorial Masonic lodges. These degrees, 25 of them, "made in France," were first systematized in 1754, at Paris, by the Chevalier Bonneville, and called the Rite of Perfection. The only thing Scottish about them was the legends attributing their origin to Scotland. Some of the partisans of the Stuarts are reputed to have been members of this rite, which also lent color to the Scottish legend. In 1758 a Council of Emperors of the East and West at Paris succeeded to the title to this Rite of Perfection of 25 degrees, and in 1761 granted a patent to Stephen Morin to introduce the rite into the West Indies. In 1772 the Council of Emperors merged with a faction of the Grand Orient of France (which controlled the three symbolic English degrees), and as the factional Grand Lodge died within a few months the Rite of Perfection dropped out of sight in France. In 1779 the Grand Orient announced its control of Masonic degrees as extending only to the first three degrees. In 1786 the Grand Orient promulgated the French rite of seven degrees, four superimposed on the three which the English Grand Lodge gave to the world. The importance of this lies in pointing out Morin's authority to disseminate the Ancient and Accepted Scottish rite, or Rite of Perfection, which he carried to America, where it was developed into a rite of 33 degrees at Charleston, S. C., in 1801. From here it went to all parts of the globe, being for many years unrecognized as an American off-

spring of the French so-called Rite of Perfection, the rite *Ecossais*, or Scottish rite, amplified and adorned. It is to-day found virtually in every country where Masonry flourishes. Where the English rite of three degrees exists, the Scottish rite, governed by supreme councils, confers degrees only from the fourth to the thirty-third.

Freemasonry was introduced into America in 1730 by the Grand Lodge of England, when Daniel Coxe of New Jersey was made Provincial Grand Master for Pennsylvania, New Jersey, and New York. St. John's Lodge in Philadelphia was chartered by Coxe in the latter part of 1730 or in 1731. Benjamin Franklin's account books show that he sold stationery to that lodge in 1731. Franklin himself became a Mason in that year. St. John's Lodge of Boston was granted a warrant in 1733 by Major Henry Price, who had been made Provincial Grand Master in England in that year. Traveling military lodges attached to the British army in the Colonies helped to spread Freemasonry throughout the New World. After the Revolution colonial lodges formed grand lodges of their own, to which they transferred their allegiance. Subordinate lodges were established by the Grand Lodge of England at Savannah, Ga., Charleston, S. C., and Wilmington, N. C., about 1730-37, and it was not until 20 years later that successors to Daniel Coxe established a lodge at New York City.

There have been scores of Masonic rites, all drawing their initiates from possessors of the first three symbolic (English) degrees of entered apprentice, fellowcraft, and master Mason, but only five of any great consequence survive. The English rite consists of the first three degrees "including the holy royal arch." The second, or American rite, beginning with the first three degrees conferred in lodges, continues (if desired) with four degrees, mark master, past master, most excellent master, and royal arch Mason, conferred in chapters; the (optional) three degrees, royal master, select master, and superexcellent master, conferred in councils; and, finally, three orders, or grades, Companion of the Red Cross, Knight Templar, and Knight of St. John and Malta, conferred in commanderies of Knights Templar. Each of the latter groups, chapters, councils, and commanderies, has a separate government under a grand or State body, and these are subsidiary each to a single general grand, or national, body. In this respect they differ from the lodges which form the basis of the whole Masonic system in that the Grand Lodge in each State forms a sovereign jurisdiction. The French rite consists of the three English degrees (as do all rites), to which have been added four degrees selected from among those most popular in France among the many unsystematized inventions which appeared in the latter half of the eighteenth century. The rite in use by most German lodges, having its sanction in the Grand Lodge of the Three Globes, adds to the three symbolic degrees, seven degrees drawn from Scottish rite sources and the Templar theory of the origin of masonry.

The Swedish rite (practiced in Norway and Sweden) mixes the English and French systems. The Rite of Memphis (Egyptian) was constructed from the Rite of Misraim, founded at Milan in 1805, with 90 degrees, Scottish and other available floating material, to rival the Ancient Accepted Scottish rite, into which its founders had been denied admission. After a

stormy career in France it became almost dormant in 1822. In 1839 the Rite of Memphis with 96 degrees and a ninety-seventh for its official head was framed at Paris out of the disintegrating finery of the Rite of Misraim, and soon sprang into life at Marseilles and Brussels. It disappeared by 1862, in which year an American carried the rite to New York, some accounts placing its transplanting eight or ten years earlier. The rite found place in England and nominally in a number of the United States, but was never active and had comparatively few members. Abroad it was chiefly useful to enable degree-peddling Masons, regular or irregular, to establish alleged "Scottish" rite grand bodies from which to peddle alleged Masonic lodge warrants to the uninformed in the United States and other countries.

The mission of Stephen Morin to the West Indies in 1761 resulted in his making a number of Scottish rite Masons of 25 degrees, who brought the rite into the Colonies—to Albany in 1767, to Philadelphia in 1781, and to Charleston in 1783. At the latter city in 1801 was created a new Ancient Accepted Scottish rite of 33 degrees. It confers, where the English three degrees exist, from the fourth to the fourteenth degrees in lodges of perfection, fifteenth and sixteenth in councils of Princes of Jerusalem, seventeenth and eighteenth in chapters of Rose Croix; nineteenth to thirty-second inclusive in consistories of Princes of the Royal Secret, and the thirty-third and last degree, that of sovereign grand inspector general, in supreme councils, of which there was to be one in each country where the rite existed, except in the United States, where there were to be two.

The "new" rite speedily went to France, where, strangely, it was welcomed as a discovery. By 1806 it had reached New York. The Mother Supreme Council of the World, formed at Charleston, now impressively housed in a temple at Washington, is known as the Supreme Council, A. A. S. R., U. S. A., Southern Jurisdiction. The Supreme Council for the Northern Jurisdiction was created at New York in 1813, with Daniel D. Tompkins, afterward Vice President of the United States, "in the Grand East." It is now established at Boston. The march of this rite throughout the world has been continuous. In the United States its growth has outrun that anywhere else, but not without years of controversy over regularity and right of control by rival Scottish rite governing bodies which ended in the reunion of 1867.

Two other Scottish rite bodies maintain a nominal existence in the United States. Each

ANCIENT, ACCEPTED SCOTTISH RITE MEMBERSHIP

	Southern Masonic Jurisdiction United States	Northern Masonic Jurisdiction United States
Number of active 33° members .	25	44
Number of emeritus 33° members	5	3
Number of honorary 33° members	847	1,085
Number of 32° members .	56,162	79,007
Number of consistories established	92	46

has a complete organization on paper, but with a relatively moderate following. The leaders in these two bodies doubtless believe they are the

real, hereditary proprietors of the rite here, but the referendum to the more than a million and a half master Masons in America does not agree with that view. Statistics of membership of the rite in the Southern and the Northern jurisdictions, 1913 and 1914 respectively, which include most of the prominent official and other representatives of the symbolic lodges and grand bodies and enjoy great material prosperity, are given in the table on the preceding page. No figures are given out by either of the other Scottish rite bodies referred to.

In the United States and most other English-speaking countries charity and protective features of the fraternity have shown themselves in the establishment of Masonic homes, orphanages, and schools for the care of dependent aged Masons and for widows and children of members. Chicago and Utica, N. Y., have very large institutions of this character. Others, including the earliest in the United States, that established at Louisville, Ky., in 1867, are the home at Philadelphia, and those at St. Louis, Mo., Richmond, Va., Burlington, N. J., Nashville, Tenn., and Wichita, Kans. These are supported by per capita taxes levied through the grand lodges and by voluntary contributions.

The Ancient Arabic Order of Nobles of the Mystic Shrine is the principal playground of American Freemasonry. It was founded at New York in 1871, the joint product of Dr. Walter M. Fleming, William J. Florence, the actor, and Prof. A. L. Rawson. It contains a legend as to an Arabic origin, and on its altars rest copies of the Bible and the Koran. Those closest to its beginnings have said that Florence conceived of it and set the stage, that Rawson, the Orientalist, wrote the ritual, and that Dr. Fleming introduced it. Only Masonic Knights Templars or thirty-second-degree members of the Scottish rite are eligible as members of "the Shrine" to wear its fez, claws, scimitar and star, which is apparently the ambition of so many members of the craft. There are 137 Shrine temples in the United States, with a total of more than 200,000 members, "nobles" as they are called.

Other Masonic places for recreation, but open to master Masons, include the Veiled Prophets of the Enchanted Realm, formed at Utica, N. Y., in the latter part of the nineteenth century, with about 5000 members; the Independent International Order of Owls, St. Louis, 1890, with perhaps 4500 members, and the Tall Cedars of Lebanon, which, like the others, is found in several States and has perhaps 10,000 members.

The Royal Order of Scotland, one of the oldest continuous appendant orders of Freemasonry, was introduced into the United States in 1878. Its two degrees are conferred in a provincial Grand Lodge held in a room of the temple of the Scottish rite, Southern Jurisdiction, where the chair is ever kept vacant for the hereditary Grand Master. These lodges are opened annually in most English-speaking countries. Membership is restricted. Its own tradition says the order took its rise in the time of David I, King of Scotland; that it presents the sacrifice of the Messiah, whereupon the candidate goes into the world to search for the lost word. This alone should date the invention not earlier than the first half of the eighteenth century.

The Order of the Red Cross of Constantine, Masonic, is conferred in grand councils in the United Kingdom and in the United States. It is based on the story of the conversion to

Christianity of Constantine the Great and his vision of the passion cross. This ceremonial is claimed to have been rescued from some of the more ambitious of those degrees which interested continental Europe between 1725 and 1760. Master Masons in the United States were made eligible to receive the order in 1897. Not more than 5000 members are believed to have been attained in America and fewer than half that in England. In the United States, Chicago and Philadelphia have been most interested in its ceremonies.

From the middle of the eighteenth century the craft has been patronized by English royalty and the nobility. The like was true in France under the Bourbons, the Bonapartes, and the Republic. In the United States, besides Washington, five signers of the Declaration of Independence—Benjamin Franklin, John Hancock, William Hooper, Philip Livingston, and Thomas Nelson, Jr.—were Masons, as were Generals Nathanael Greene, Richard Henry Lee, Israel Putnam, Francis Marion, Barons De Kalb and Steuben and Marquis de Lafayette, Gen. Joseph Warren, Paul Revere, and Brandt, the Mohawk, and Tecumseh, the Shawnee chief. Ten Presidents of the United States were Masons, if Fillmore, who recanted, be counted. In addition to Washington they were Jackson, Polk, Buchanan, Johnson, Garfield, McKinley, Roosevelt, and Taft.

The Sovereign College of Allied Masonic and Christian Degrees of America, Richmond, Va., is described by itself as a body of Masons which confers academic and ritualistic degrees for distinguished service to the craft. Little is known of it other than finding it on various lists of Masonic organizations. It quotes several well-known side or detached degrees, some from the era in which degree making and selling were popular, and which are now interesting chiefly as curios.

The Order of the Eastern Star, often referred to as a Masonic society to which women relatives of Masons are eligible, has no Masonic connection whatever, other than that its membership is confined to women, as described, and to master Masons who may care to join it. This mixed men-and-women order, made up of Masons, their wives, daughters, mothers, etc., was formed in 1868, has governing chapters in almost every State in the Union and nearly 350,000 members.

Negro Freemasonry in the United States is as legitimate in its origin as that which came to white men in America from the Grand Lodge of England, as they were both derived from the same source. At Boston in 1775, Prince Hall, a negro, and 14 other colored men were made Masons in an English army lodge at what is now Fort Independence. It has been conjectured that the English, knowing the whites would resent such a proceeding, initiated the negroes to enlist the aid of the latter. If so, the plan failed, for Prince Hall sided with and fought for the colonists. In 1784 the Grand Lodge of England granted a warrant to Prince Hall and associates constituting African Lodge 454. There never has been a difficulty over the social gulf between the black and white races at this action by the English Grand Lodge. The latter dropped African Lodge from its roster after the union of 1813. There is no affiliation or recognition between white and colored Freemasonry in the United States. The latter has, or recently

had, a National Grand Lodge, something the white Masons never had. Colored Freemasons number perhaps 200,000, with lodges and grand lodges in nearly half of the States of the Union. They have paralleled, too, the Royal Arch Chapter degrees with perhaps 10,000 members; Knight Templary ceremonials with, as claimed, about 5000 members; and have a number of Scottish rite bodies, derived by charter through a representative of the Supreme Council of France, and, as reported, 2000 or more thirty-second-degree members.

Anti-Masonic sentiment has shown itself in three ways since the revival of Masonry in 1717. The first, continuous since 1724, comes from the Roman Catholic church; the second, attracting very little attention, from several offshoots of the Scotch Presbyterian church; while the third was shown for only about a decade following the disappearance from Batavia, N. Y., in 1827, of William Morgan, who had threatened to make public Masonic secrets.

In 1738 Pope Clement issued a bull against Freemasonry, enjoining temporal and spiritual communities against entering the society or spreading or defending its principles or admitting it to their houses under pain of excommunication. In the Latin American republics the church has continued, with the aid of successive papal bulls, to denounce Freemasonry and prohibit Catholics from joining not only the Masons but a few other secret societies to which many Masons belong. There is no rule or regulation in Masonry which could be construed as preventing a Roman Catholic from becoming a member, and the church's antagonism to the craft of late, particularly in France, Italy, and Spain, has been due perhaps to reported atheistic and antichurch tendencies among lodge members there, for part of which the latter have been cut off from affiliation with English-speaking bodies, and because of the general attitude of many Latin American grand lodges in antagonizing the church politically.

In 1757 the synod of Stirling debarred all adhering Freemasons from the ordinances of religion, and that attitude has been continued since by several factions of the Scotch church.

The disappearance of William Morgan, whom people imagined to have been thrown into Niagara River by the Masons, created a tremendous excitement which Thurlow Weed and William H. Seward and others turned to political advantage by pretending that a body found in the river had been recognized as Morgan's. Asked later as to the claim, Weed made the famous comment that it was a "good enough Morgan until after election." So great was the outcry at the time that lodges were abandoned right and left in the Eastern and Middle States, while many families, church members, and friends separated on the issue. An anti-Masonic party was formed, became for a few years practically the only opponent of the Democratic party, and in 1832 ran William Wirt for the presidency, who, with Clay, Republican candidate, was defeated by Andrew Jackson, a Freemason. (See ANTI-MASONS.) Freemasonry recovered slowly from the inquisition given it by the anti-Masonic party. During 10 years prior to the Civil War the craft in the United States fully recovered what it lost between 1828 and 1840 and has grown rapidly ever since the war ended.

MASO'RA, MASSORAH, MASSORETH (Heb. tradition, from *māsar*, to hand over). A particular collection of critical notes on the text of the Old Testament, its divisions, accents, vowels, grammatical forms, letters, etc. According to the early mode of Semitic writing, only the consonants were indicated; hence in the course of time there inevitably arose a vast number of variants in the Old Testament text, or rather different ways of reading and interpreting the same letters by dividing them into different words with different vowels and accents. Some measures for the more accurate preservation of the documents became indispensable, and the desideratum was supplied by the Masora, which, by fixing an immutable reading upon each verse, word, and letter, put an end to the confusion and left the individual fancy free to take its own views for homiletical purposes only. The origin of the Masora is shrouded in mystery. The first certain traces of it are found in certain Halachistic works treating of the synagogue rolls of the Pentateuch and the mode of writing them, and it is reasonable to suppose that practical necessities called forth by the institution of readings from the Pentateuch and Prophets as a regular feature of religious services led to accurate determination of the text of each verse, the number of letters, and the pronunciation of each word, including the proper intonation. A late Talmudic treatise, *Masseketh Sopherim*, treats of these matters. Some of the earliest works on the subject have survived in their titles only, such as *The Book of the Crowns* and *The Book of the Sounds*. There can hardly be a doubt that the Masora, like the Halacha and Haggada, was the work, not of one age or century, but of many ages and centuries, as, indeed, we find in ancient authorities mention of different systems of accentuation used in Tiberias, Babylon (Assyria), and Palestine. In the period of Hadrian we learn of two scholars, Nakkai and Hammum, who are said to have counted the number of verses in the books of the Old Testament, but the systematic work of the Masoretes belongs to a much later period. The vowel system at present employed, which is their work, cannot be traced further back than c.700 A.D., and appears to be based on the example furnished by Syrian grammarians; but before this was perfected at Tiberias in Palestine another system, chiefly superlinear in character and much more complicated, was evolved and adopted in Babylonia. These two systems are distinguished as the Tiberian and the Babylonian respectively. It was in Tiberias that the Masora was first committed to writing. Monographs, memorial verses, finally glosses on the margins of the text, seem to have been the ear-

liest forms of the written Masora, which gradually expanded into one of the most elaborate and minute systems, laid down in the "Great Masora," made up of longer notes placed upon the upper and lower margins (about the eleventh century). Besides this there was compiled the "Small Masora," notes placed between the columns of the texts. A further distinction is made between Masora *textualis* and *finalis*, the former containing all the marginal notes; the latter, larger annotations, which, for want of space, had to be placed at the end of the paragraph. Of independent Masoretic works the most important is the one known as *Ochlah weochlah*. The final arrangement of the Masora, which was first printed in Bomberg's Rabbinical Bible (Venice, 1524-25), is due to Jacob ben Chayim ben Adonijah and to Felix Pratensis. The language of the Masora is Aramaic, and besides the difficulty of this idiom, the obscure abbreviations, contractions, symbolical signs, etc., with which the work abounds, render its study exceedingly difficult. An explanation of the Masora is found in Elias Levita, *Masoreth Ha-Masoreth* (translated into German by Semler, Halle, 1772; edited, with an English translation by Ginsburg, London, 1867), and Buxtorf, *Tiberias* (Basel, 1620). MASÓ Y MARQUEZ, mã-sô' ê mãr'kâth, BARTOLOMÉ (1834-1907). A Cuban patriot, born near Manzanillo and educated in France. He became a rich planter. At the outbreak of the Ten Years' War (1868-78), he joined the patriot army and rose to the rank of colonel. Céspedes made him Superintendent General of the Treasury and he was active in the service of the Republic under Estrada Palma. After the war he was arrested and imprisoned. From 1883 to 1895 he was again a prosperous planter near Manzanillo, and, in the latter year, was the first prominent Cuban to join the revolutionary movement started by José Martí (q.v.). He was chosen Vice President of the newly organized insurgent government (September, 1895) and in 1897 was elected President. In 1901 he was considered as the logical candidate for the vice presidency with Estrada Palma, but, being opposed to the Platt amendment, he finally came out as his opponent. Although he had a large following, he withdrew his candidacy before the date of the election, alleging that unfair methods were being used in the canvass.

MASPERO, mã'spe-rô', SIR GASTON CAMILLE CHARLES (1846-1916). A distinguished French Egyptologist. He was born in Paris, June 23, 1846, and received his early education at the Lycée Louis le Grand. At the age of 14 he studied the Egyptian language privately, and in 1865, when he entered the Ecole Normale, he had attained a high degree of proficiency in the interpretation of hieroglyphic texts. Two years later he published, with the approval of Mariette, his *Essai sur l'inscription dédicatoire*

du temple d'Abydos et la jeunesse de Sésostriis. In 1867 he went to Montevideo to coöperate with Vicente Fidel Lopez in his studies on the Indian dialects of Peru, translating into French and editing Lopez's work, *Les races aryennes de Pérou*. On his return to Paris, a year later, he resumed his Egyptological studies, and in 1869 he read before the Académie des Inscriptions a memoir on the Abbott Papyrus, containing an official report in regard to the tomb robberies in the Theban necropolis under Ramses IX. This memoir, under the title *Une enquête judiciaire à Thèbes au temps de la XXème dynastie*, was published at Paris in 1871. In 1869 Maspero became *répétiteur* in the department of Egyptology at the Ecole des Hautes Etudes, and three years later he passed the examination for the degree of doctor, presenting two theses: *De Carchemidis Oppidi Situ et Historia Antiquissima* and *Du genre épistolaire chez les Egyptiens de l'époque pharaonique*. In 1874 he was appointed professor of Egyptology in the Collège de France as the successor of E. de Rougé. In 1875 was published his *L'Histoire ancienne des peuples de l'Orient*, which was the first attempt to present, from monumental sources, the history of the ancient East as a whole, and to exhibit the relations existing in antiquity between the peoples of western Asia and the Nile valley. The eleventh edition of this work, which has been frequently revised, was published in 1912. In the course of the next five years Maspero wrote a number of valuable memoirs on Egyptian philology, history, and archaeology, the most important being: "De quelques navigations des Egyptiens sur la mer Erythrée" (*Revue Historique*, 1878); "La grande inscription de Beni-Hassan" (*Recueil de Travaux*, 1878); "Récit de la campagne de Mageddo sous Thoutmès III" (*Recueil de Travaux*, 1879-80). He received the decoration of the Legion of Honor in 1879 and in 1882 was made an Officer of the Legion. In 1880 he was sent by the French government to Egypt at the head of the Mission Archéologique, which, under his skillful management, developed into a school for the prosecution of advanced studies in Egyptology and kindred subjects. In 1881 Maspero was appointed director of the excavations and antiquities of Egypt, succeeding Mariette, several of whose posthumous works he edited and whose biography he wrote in 1905. His excavations, though less extensive than those of his predecessor, were more methodical, and he is entitled to special credit for his successful efforts for the preservation and protection of the monuments of Egypt. In 1883 he became a member of the Académie des Inscriptions et Belles-Lettres. In June, 1886, leaving Grébaut as his successor in Egypt, he returned to Paris and resumed his chair at the Collège de France, assuming at the same time the direction of Egyptological studies in the Ecole des Hautes Etudes. In 1899 he returned to Egypt to resume the position which he had resigned in 1886, and he remained there until 1914, when his election as permanent secretary of the Académie des Inscriptions et Belles-Lettres brought him back to Paris. He received the English K. C. M. G. in 1909. Maspero's works are very numerous. In addition to those already mentioned, some of the most important are: *Hymne au Nil* (1868); *Etudes égyptiennes* (1879-91); *Les contes populaires de l'Egypte ancienne* (1882; 4th ed., 1911); *Mémoire sur*

quelques papyrus du Louvre (1883); *L'Archéologie égyptienne* (1887; Eng. trans. by Amelia B. Edwards as *Manual of Egyptian Archaeology and Guide to the Study of Antiquities in Egypt*; also translated and enlarged by Agnes S. Johns, 6th Eng. ed., 1914); *Les momies royales de Deir-el-Bahari* (1889); *Lectures historiques: Egypte et Assyrie anciennes* (1890; 6th ed., 1912); *Études de mythologie et d'archéologie égyptiennes* (1892 et seq.; vol. vii, 1912). Translations, edited by Sayce, were published as: *The Dawn of Civilization: Egypt and Chaldaea* (3d ed., 1897); *The Struggle of the Nations: Egypt, Syria, and Assyria* (1897); *The Passing of the Empires, 850-330 B.C.* (1900). *A Complete History of Egypt* in twelve volumes appeared in 1904 et seq. Other works include: *Les contes populaires de l'Égypte ancienne* (3d ed., 1906); *Causeries d'Égypte* (1907; Eng. trans. by Elizabeth Lee, *New Light on Ancient Egypt*, 1909); *Egypt, Ancient Sites and Modern Scenes* (trans. by Lee, 1911); *Art in Egypt* (1912; appeared in United States, England, France, Germany, Italy, Spain); *Egyptian Art* (trans. by Lee, 1913). Maspero edited the valuable *Mémoires de la mission française au Caire* (1884 et seq.) and in 1879 assumed editorial direction of the *Recueil de travaux relatifs à la philologie et l'archéologie égyptiennes et assyriennes*. It was in this journal (vols. i-xiv) that he published the text and translation of the inscriptions engraved upon the walls of the pyramids of the fifth and sixth dynasties at Saqqara (q.v.). He also contributed frequently to the *Journal asiatique*. See EGYPTOLOGY.

MASQUE (Fr., mask), or **MASK**. A species of dramatic entertainment much in vogue in England in the sixteenth and seventeenth centuries, so named from the masks (see MASK) which were originally worn in it. It was introduced during the reign of Henry VIII in imitation of some of the Italian allegorical pageants of the period, and was at the same time a development of the festive processions of the city of London and of the royal progresses. Around the acted pageantry of the mythological and allegorical personages in these there grew up regular dramatic performances in which music and dancing were prominent and which were comparable to the *ballets* of the French court. (See BALLET.) Masques were in their time the favorite form of private theatricals, though the elaborate and expensive style in which they were usually given limited them for the most part to the homes of the nobility and the court. They were at their best in James I's day. Ben Jonson, above all, made the masque a thing of literary beauty, in which his classic learning and graceful fancy united to furnish royal amusement. As spectacles, masques were largely an affair of costume and of scenic design, to which the architect Inigo Jones lent his aid. The taste for this style of entertainment died away under Charles I; yet to his time belongs Milton's *Comus*. In this, however, though it was made to be acted, the masque has become a literary form practically independent of actual presentation, and as such it has survived to our day.

Symonds, *Shakspeare's Predecessors in the English Drama* (ib., 1900); Ronald Bayne, "Masque and Pastoral," in *Cambridge English Literature*, vol. vi (Cambridge, 1910), containing a bibliography; Mary Sullivan, *Court Masques of James I: Their Influence on Shakespeare and the Public Theatres* (New York, 1913).

MASQUERADE mäs'ke-räd' (Fr., from Sp., Portug. *mascarada*, masquerade, from *mascara*, mask). The disguise effected by wearing a mask or strange apparel, or the assembly itself of persons masked and disguised with fantastic dress. In early times the masquerade often accompanied religious observances; it was a feature of the Greek Bacchanalia and the Roman Saturnalia, and fantastic costume, at least, is known to have been worn at the Jewish feast of Purim. The Druids when proclaiming the New Year (q.v.) masked and disguised in women's robes, the skins of beasts, etc. During the Middle Ages masquerades characterized by great frivolity and extravagance were held in the churches in spite of the attempts of the Fathers to do away with them. Even the priests took part in them. Of this nature were the feast of fools (q.v.) and other burlesquing festivals, recalling the heathen Saturnalia. They bore different names in different countries and were continued until the sixteenth century. Such was probably the origin of the masked ball, an exclusive form of masquerade which was introduced into the French court by Catharine de' Medici. It found its way to England in the reign of Henry VIII, but did not reach any of the courts of Germany till the end of the seventeenth century. The *bal costumé* is a very modified and much less objectionable form of the masquerade. During the carnival public masquerades are held in all the theatres and dancing saloons of Paris, and processions of maskers pass through the streets playing mad pranks. See CARNIVAL; GREEK FESTIVALS.

MASS. The name given among Catholics to the Eucharist or Lord's Supper (q.v.), considered as the highest form of Christian worship, as a sacrifice, and the offering of the body and blood of Jesus Christ under the forms of bread and wine. The proofs adduced to show its institution under this aspect at the Last Supper are the words employed on that occasion; the teaching of St. Paul and of the Fathers of the Church; the practice of the Apostles; the unbroken tradition of all Christendom for 16 centuries; and its retention as a sacrifice in the Eastern churches which separated from Catholic unity. The prophecy of Malachi (i, 11) is likewise regarded as foretelling it. The teaching of Roman Catholic theologians is that in the Eucharist Christ is "as it were slain." He is not merely present, but is in a state which is a kind of death. He is there with all the perfections of his godhead, and all the complete nature, functions, and glory of his manhood; all, in fact, that he is in heaven; but he does not manifest it; nor does he exercise his powers in the Sacrament as he does in heaven. How much or how little his human senses are exerted is still a matter of discussion among theologians. This sacramented condition of Christ is evidently the greatest conceivable way of expressing subjection to God's dominion, of impetrating, atoning, and rendering thanks, the four objects which are considered to be the purposes of the Sacrifice of

the Mass. Necessarily it supposes transubstantiation (q.v.) and the priestly power. Accordingly it can only be offered by one who is in priest's orders. By the law of the church he must be fasting, absolutely, from the midnight previous to the celebration of the mass. It is offered in the morning, though this time may be extended, for reasons legislated upon, to a limited time after midday. Each priest is permitted to offer it once a day; though on Christmas Day he may offer three masses, and in some countries two on All Souls' Day. In some countries where there is a lack of priests it is permitted to celebrate mass twice on Sundays; otherwise the people would not be able to fulfill the obligation which is incumbent upon them of assisting at mass on Sundays and certain great festivals. (See COMMANDMENTS OF THE CHURCH.) Absence from this public worship on Sundays and certain feasts without sufficient reason is held to be a grievous sin.

The priest who celebrates always communicates. This is for the integrity of the sacrifice; but the essence of the sacrifice is by many taught to be in the consecration. Whether some or none of the congregation communicate does not affect the sacrifice; the rule is, however, that some one must be present to make the responses. (For the teaching and details as to communion, see SACRAMENT; COMMUNION IN BOTH KINDS.) The bread must be wheaten bread; the wine, wine of the grape. In the Eastern church leavened, in the Western unleavened, bread is used. The time of the introduction of unleavened bread in the West is not certain.

Private masses are said in a low tone, and hence called low masses. Those which are sung are called high masses, and if the celebrant is assisted by other ministers the mass is said to be solemn; if the celebrant is a bishop it is pontifical. Those celebrated for the dead are called, from the first word of the introit, requiems; and the mass at the celebration of marriage is called a nuptial mass. As saints are honored on almost every day of the liturgical year, prayers in which their intercession is invoked are introduced at the beginning and at the end of the service, and also in the part which the priest recites in a tone audible only to himself, and hence called the Secret.

There are certain days not devoted to the commemoration of any mystery or saint, and the priest is permitted to choose one in whose honor he may celebrate according to his devotion; these are termed votive masses. There is no such thing as *dry mass*; the expression is used to denote the going through, by one who is preparing for the priesthood, of the various prayers and ceremonies in order to familiarize himself with them. The "mass of the presanctified," used on Good Friday (see HOLY WEEK), is not a complete mass, lacking the consecration.

The use of an unchanging language like Latin and some Oriental languages is intended to be a safeguard against new meanings that grow into words in the use of living tongues. It is not necessary, on the theory here explained, that the words should be understood or even heard in detail by the congregation any more than it was necessary for the Jews to enter the sanctuary where the sacrifice was being offered. They understand that they are taking part in the supreme act of worship, though even the assistant at the priest's side may not be able to hear the words of consecration.

For the vestments used in the mass, see COSTUME, ECCLESIASTICAL; and for the early development of liturgical structure, see LITURGY. The mass is divided into two main parts, known from ancient analogy as *missa catechumenorum* and *missa fidelium*, the latter or more sacred part having been originally that from which the unbaptized were excluded. (See DISCIPLINA ARCANI.) A similar distinction, though not identical, is made between the Pro-Anaphora and Anaphora of the Greek liturgies. The first consists of the celebrant's preparation at the foot of the altar, introit, *Kyrie eleison*, *Gloria*, collect, epistle and gospel, and creed. The second begins with the offertory or oblation of the elements; the preface leads up to the *Sanctus*, and then follow the canon or practically unvarying central portion of the mass (including the consecration) and its accompanying prayers, the communion, and the postcommunion; the congregation is dismissed with the ancient formula *Ite missa est*, from which the mass derives its name (Lat. *missa*). See the articles on all the more important parts of the service named above.

The musical history connected with the mass is of considerable importance, as the early development of polyphonic music was almost exclusively along the lines of sacred use. Originally the whole service, when sung, was set to plain chant (q.v.); but later the *Kyrie*, *Gloria*, *Credo*, *Sanctus*, and *Agnus Dei* were detached and set to new music, these numbers constituting what is called a mass in the musical sense. The masses of the composers of the Gallo-Belgic school of the fifteenth century had become so complicated and overloaded with contrapuntal tricks that a desire for a simple and more dignified style was created. Palestrina inaugurated the new epoch in writing distinguished by grandeur and majesty; his compositions were usually for four to eight voices. The great masters of the seventeenth and eighteenth centuries wrote masses for eight, twelve, sixteen, twenty-four, and sometimes even more voices. All these works were written a *cappella*, without instrumental accompaniment. The development of instrumental music suggested new combinations, and the *missa solemnis* of Bach and Beethoven thus grew up. Gounod, Silas, and Widor have given notable examples of this style in more recent times. See SACRED MUSIC.

MASS. See MATTER.

MASSA, mäs'sä. The capital of the Province of Massa e Carrara, Italy, on a hill rising from the banks of the Frigido, 3 miles from its outlet in the Gulf of Genoa and 26 miles north of Pisa (Map: Italy, C 2). Its chief buildings are the ducal palace, now the prefecture building, a former summer residence of Elisa Bacciochi, Napoleon's sister. Its institutions include a Gymnasium, lyceum, technical school, and art

school. Massa has fine marble quarries, which are extensively worked, and important manufactures of silk, paper, and olive oil. It was formerly the capital of a principality and later of the Duchy of Massa-Carrara, which was united with Modena in 1829. It is jointly with Carrara the seat of a bishop. Pop. (commune), 1901, 26,413; 1911, 30,830.

MASSACHUSET (at the great hills, i.e., the Blue Hills of Milton). An important Algonquian confederacy formerly occupying the territory about Massachusetts Bay, and extending along the coast from Plymouth northward to about Salem, including the basins of the Neponset and Charles rivers. Their principal village, from which they took their name, was on the site of Quincy, in Norfolk County. Before the coming of the whites they seem to have held the leading place among the tribes of southern New England, and are said on good authority to have had over 20 villages in 1614. They suffered more than any other tribe from the great pestilence of 1617, and when the English arrived a few years later they found the Massachusetts reduced to a mere handful and most of the villages depopulated. In 1631 they numbered only about 500, and two years later were still further reduced by smallpox, which carried off their chief, Chickatabot. In 1646 they were gathered, with other converts, into the mission villages of Natick, Nonantum, and Ponkapog, and ceased to have a separate tribal existence.

MASSACHUSETTS. A North Atlantic State of the American Union, belonging to the New England group. Except the eastern part, which expands along the ocean front, Massachusetts resembles generally a parallelogram and lies approximately between lat. 42° and 42° 43' N. It is bounded on the north by the States of Vermont and New Hampshire, on the west by New York, on the south by Connecticut and Rhode Island and the Atlantic Ocean, and on the east by the Atlantic Ocean. Its greatest length is 184 miles; the distance from Cape Ann due west to the New York State line, 138 miles; the extreme width is 113¾ miles, and the average width in the west 47¾ miles. The total area is 8266 square miles, of which the water surface amounts to 227 square miles. The irregular coast line gives an ocean frontage of nearly 300 miles, excluding the shore lines of the islands and lesser inlets. There are three great bays—Cape Cod Bay, Massachusetts Bay, and Buzzards Bay.

Topography. Massachusetts, a part of the upland or uplifted peneplain of southern New England which slopes from the local representatives of the Appalachian Mountains southeastward to the sea, may be divided into four physiographic provinces. 1. In the extreme west, extending north and south across the State, the Berkshire Hills (from Berkshire County) are a continuation of the Green Mountains of Vermont, and are composed of a number of ranges and minor valleys. The Taconic Range attains an extreme elevation of 3535 feet in Greylock or Saddle Mountain, near the northern boundary—the highest elevation in Massachusetts. The altitude falls away slightly to the south, where Mount Washington or Everett, in the southwest corner of the State, rises to a height of 2624 feet. The Hoosac Range has a somewhat regular altitude of 1200 to 1600 feet, reaching its maximum in Spruce Hill—2588 feet. The Housatonic valley has an elevation of 1100 feet at its north

end and falls to 800 in the south. East of these ranges to the Connecticut the slope is southeast and is deeply cut by rivers. 2. The Connecticut valley, the second province, a broad flood plain, running from the Vermont-New Hampshire line and extending into Connecticut, has been cut out of the upland because of the presence of a less resistant rock than is found to the east or the west. The trap ridges, so conspicuous in the State of Connecticut from Long Island Sound up, are represented in the valley by Mount Tom, with an altitude of 1214 feet, Mount Holyoke, 955 feet, and others which rise as isolated peaks above the surrounding low country but do not extend above the upland level. 3. The country on the east side of the Connecticut River is a dissected plateau, with an elevation of about 1100 feet at the middle of the State, the surface sloping gradually eastward. Upon the old Cretaceous base level, which forms the top of most of the hills, some older hills stand out as monadnocks, the most conspicuous of which is Wachusett Mountain, 2108 feet in height. 4. In the eastern section the country is generally level or undulating. This lowland continues southeastward into the Cape Cod peninsula, extending in the form of an arm bent at the elbow for a distance of 65 miles, 35 miles eastward and a nearly equal distance northward, curving slightly westward at the extremity. Near this southern projection of the State lie many islands similar in character to the Cape Cod peninsula—Marthas Vineyard, the 16 Elizabeth Islands, and Nantucket Island.

Hydrography. The rivers of Massachusetts are numerous, but unimportant for purposes of navigation. The Connecticut traverses the State from north to south. It varies in width from 450 feet to 100 feet, but its flow is broken by falls at various points. On its western side it receives the Deerfield and Westfield, and from the east Millers River and the Chicopee. Though navigable for small craft it is chiefly important for its water power and for floating logs from the forests near its headwaters. Between the Taconic and the Hoosac Mountains flow north and south, respectively, the Hoosac and Housatonic rivers, the former discharging into the Hudson, the latter into Long Island Sound. The valleys of the Connecticut and its branches and the Housatonic are noted for their picturesque scenery. Descending from New Hampshire, the Merrimac flows for 35 miles through the northeastern corner of the State, discharging into the Atlantic Ocean. It is navigable for small craft as far as Haverhill, 15 miles from its mouth, but is valuable especially for its water power. Other rivers important also chiefly for their water power are the Concord, emptying into the Merrimac at Lowell; the Charles, discharging into Massachusetts Bay at Boston; and the Blackstone and the Taunton, flowing south into Narragansett Bay. The courses of the rivers are marked by broad reaches and sudden declines, instead of uniform gradients. Very many small glacial lakes are scattered over the State, especially near Cape Cod. There are excellent harbors at Fall River, New Bedford, Provincetown, Plymouth, Boston, Lynn, Marblehead, Salem, Gloucester, and Newburyport. Boston harbor is the most important harbor in the State. It is protected from the severe northeast storms by drumlins which have been partly submerged and tied to the mainland by spits, but the small basin formed thereby acts as a catch-

ment for the sediment brought down by the rivers. South of Boston the inlets are all of the "hook spit" type, a prominent feature along this part of the coast; but only the harbor of Provincetown is deep enough to accommodate the largest ocean ships. Buzzards Bay, the third largest indentation of the State, extends 30 miles inland to the west of Cape Cod, and contains New Bedford and Wareham harbors. The former is one of the most important havens in the State.

Climate. Massachusetts lies in the middle of the north temperate zone, yet, because of its proximity to the paths of the cyclonic and anticyclonic disturbances, it is strongly influenced by the north winds of winter and by the west and southwest winds of summer, bringing respectively the cold waves and the hot continental air to the coast. The average temperature for January is between 25° F. and 30° F., and for July about 70° F. In Boston the highest temperature ever recorded is 104° F. and the lowest, 13° below zero F. Inland the winter extreme especially is frequently exceeded. There is an average annual precipitation of 40 inches and over, very evenly distributed through the year. The snowfall is rather heavy, ranging from 30 inches at the south coast to 60 inches in the northwestern counties. The average annual relative humidity ranges from 80 per cent on the islands at the southeast to less than 70 per cent in the northwestern counties. The islands of Marthas Vineyard and Nantucket have an average wind velocity for the year of 14 miles per hour, the highest average recorded in the United States. The normal wind direction for January is northwest, and for July is southwest.

Soil. The soil of the State is largely the result of glacial erosion and deposition. The harder ridges, overridden by the ice, were denuded of all soil; the debris of the granitic hills is too coarse and too new to invite cultivation.

The Triassic valley of the Connecticut River gives flat lands of exceeding fertility, while river and lake deposits of worked-over glacial till furnish many alluvial plains of very rich land, but of limited area.

Many glacial lakes are partly filled and are utilized as cranberry marshes.

Geology. Massachusetts has a very complex geological history. At the beginning of Cambrian time three mountain masses of granitic rock extended across the State to the northeast, alternating with arms of the sea. Cambrian and Ordovician strata were deposited on the shore of the Champlain channel, west of Hoosac Mountain; in a narrow gulf, which extended from Gaspé Point to Worcester; and in a trough extending from western Rhode Island via Portsmouth to the Bay of Fundy. The Hoosac Mountain and its continuation in the Green Mountains represent the axis of the Appalachian mountain making in New England, and the older Paleozoic clastics to the west were very strongly metamorphosed—the limestones into marbles, the muds and gravels into slates and schists, and some of the sandstones into quartzites. In Carboniferous time the whole State had been worn down to base level, and coal measures were deposited in the Rhode Island-Nova Scotia basin and in the Gaspé-Worcester trough. In Triassic time there was an estuary in the Connecticut River valley extending to the north boundary of the State, with an average of 20 miles in width.

This estuary was gradually filled with sandstones, and during their formation there were great outflows of trap rock. In the later Cretaceous all New England was reduced to base level, the southeastern margin of Massachusetts being under a shallow sea, receiving deposits of clays, as at Gay Head in Marthas Vineyard. The State was involved in the uplift of the Appalachian region at the close of the Cretaceous, and was raised into a plateau of moderate elevation. Massachusetts shared with the whole of New England in the denudation and erosion of the Pleistocene glaciation. The ice moved southward and southeastward across the State, discharging into the sea beyond Nantucket and Long Island and by deposition of its debris giving reality as well as form to Nantucket, Marthas Vineyard, and Cape Cod. It strongly accentuated the southward-trending valleys, while the higher ridges were denuded of soil, and the ice, on receding to the north, left the State strewn with a mantle of drift.

Mineral Production. Quarry products and clay are the chief mineral products. Measured by value, about 60 per cent of the stone quarried is granite, which is used chiefly for building and monumental purposes. The quarrying of trap rock is next to that of granite in the value of the output, Massachusetts being one of the half-dozen States in which the production of trap rock is an important industry. The total value of stone produced in 1913 was \$4,096,372. Massachusetts was for many years the largest producer of granite in the United States, but is now surpassed by Maine and Vermont.

The chief clay products are common brick and brick for stove lining. The lime-burning industry is located in Berkshire County and is carried on independently of the marble-quarrying operations. The production of lime in 1913 was 130,365 tons, valued at \$683,541. The production of sand and gravel in 1913 amounted to 290,757 short tons, valued at \$149,036. In addition to the above, emery, fuller's earth, gems, infusorial earth, quartz, sand-lime brick, and talc are produced. The total value of all minerals produced in 1913 was \$7,044,529.

Agriculture. Of an approximate land area of 5,144,960 acres in 1910, 2,875,941 acres were in farms, which numbered 36,917. Improved land in farms in 1910 was 1,164,501 acres. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, in 1910, was \$226,474,025. The average value of all property per farm was \$6135 in 1910, while the average value of land per acre was \$36.69. The number of farms operated by owners and managers, in 1910, was 33,938. The native white farmers in 1910 numbered 28,431, the foreign-born white farmers 8362, and the negro and other non-whites 124. Of the foreign-born white farmers the greater number came from Canada.

The table on page 205 gives the acreage, production, and value of the principal crops in 1914. The figures are estimates of the United States Department of Agriculture.

The total value of crops in 1909 was \$31,948,000 and the combined acreage of crops for which acreage was reported was 654,844, representing 56.2 per cent of the total improved land in farms. The general character of agriculture is indicated by the fact that only 5.1 per cent of the total value of crops in 1909 was contributed by the cereals, while over one-third was con-

tributed by hay and forage and one-fourth by potatoes and other vegetables. In 1909, the production of hay and forage was 831,955 tons, valued at \$11,280,989, with an acreage of 519,503. The total acreage of potatoes and other vegetables in 1909 was 61,686 and their value

PRODUCTS	Acreage	Prod. bu.	Value
Corn.....	48,000	2,256,000	\$1,918,000
Oats.....	9,000	333,000	186,000
Rye.....	3,000	57,000	58,000
Potatoes.....	27,000	4,185,000	2,971,000
Hay.....	480,000	*634,000	13,631,000
Tobacco.....	6,600	†11,550	2,044,000

* Tons.

† Pounds.

\$8,184,000. Excluding potatoes and sweet potatoes, the acreage of vegetables was 37,220, valued at \$6,190,000. Tobacco had an acreage of 5521 in that year, and the production amounted to 9,549,306 pounds, valued at \$1,218,060. The total value of orchard fruits in 1909 was \$2,074,270, there being produced 2,763,679 bushels. The most important of these fruits are apples, of which 2,550,259 bushels, valued at \$1,780,290, were grown in 1909. Other important orchard fruits are peaches and nectarines, pears, plums, and prunes. The most important of the small fruits are cranberries, which are grown chiefly in the marshy lands of Barnstable and Plymouth counties. The acreage devoted to this fruit in 1909 was 6577. There were produced 22,714,496 quarts, valued at \$1,062,205. Next in point of value were strawberries. Other small fruits grown in important quantities are blackberries, dewberries, raspberries, loganberries, and currants. The total quantity of small fruits produced in 1909 was 29,260,143 quarts, valued at \$1,676,790. The grapes produced in 1909 amounted to 1,132,838 pounds, valued at \$30,858.

Tobacco has been raised in the valley of the Connecticut River since earliest Colonial days. In the growing of flowers and plants Massachusetts is one of the most important States. The value of the flowers and plants grown in 1909 was \$2,455,467. The value of the maple sugar and maple sirup produced in the State in 1909 was \$77,559.

Live Stock and Dairy Products. As in other New England States, stock raising has suffered from the effects of Western competition. The development of intensive farming has necessitated an increase in the number of horses, and the rapid growth of the dairying industry has resulted in a gain in the number of dairy cows. The total value of live stock on the farms of the State in 1910 was \$19,208,712. There were 252,416 cattle, valued at \$9,348,076. On Jan. 1, 1915, the number of cattle other than milch cows was estimated at 83,000, with a value of \$2,083,000; milch cows, 157,000, valued at \$10,362,000; horses, 64,000, valued at \$9,920,000; sheep, 30,000, valued at \$168,000; swine, 108,000, valued at \$1,674,000. The total value of fowls of all kinds in 1910 was \$1,492,961. The value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$15,187,774. There were sold 64,496,692 gallons of milk, valued at \$13,297,634, and 2,220,311 pounds of butter, valued at \$696,336.

Fisheries. The Massachusetts Bay Colony early recognized fishing as one of the leading industries, in fact, second only to farming.

Special legislation was adopted whereby the fisheries were exempt from taxation, and ship carpenters and fishermen from military duty. Boston began to export fish in 1633, and fishing villages soon sprang up all along the coast. Gloucester became, as it still continues to be, the most prominent port in the world in the cod and mackerel fisheries off Newfoundland and Labrador. Whales were first caught off Nantucket in 1690, and New Bedford became famous in the whale fisheries, its whaling vessels frequenting the remotest seas. This industry has steadily declined. The United States Fish Commission has extensive hatcheries, laboratory, and school at Woods Hole, and the State has hatcheries at Wilkinsonville and Winchester. In the items of investment and value of products the fishing industry of Massachusetts in 1908 exceeded that of all other States of the Union. It has over one-half of the investment in, more than half of the quantity of, and fully half of the value of, the products of the coast fisheries of New England. The products, derived chiefly from the numerous offshore fishing banks extending along the coast from Nantucket Shoals, Mass., to the Grand Banks of Newfoundland, are, in order of value, codfish, haddock, mackerel, herring, pollack, halibut, lobsters, hake, and numerous species of fish, etc., of less importance. In 1908 there were 11,577 men engaged in fisheries. The capital in 1908 was estimated at \$5,749,000. The value of the product for the same year was \$7,095,000. The industry is concentrated almost entirely in the cities of Boston and Gloucester, particularly in the former. The returns for 1908 show that fully 50 per cent of the industry was located in Essex County.

Forest Products. The area of standing forest in 1908 was 8040 square miles, representing about 39 per cent of the area of the State. Very little of this, however, was of any commercial value. In 1909 there were forest products to the value of \$2,668,410 cut or produced on farms. The lumber sawed in 1913 amounted to 224,580 M feet, board measure.

Manufactures. Massachusetts is preëminently a manufacturing State, its early industrial development being due in part to the fact that it contained one of the first permanent settlements of North America. The superior water-power advantages which the State affords were largely instrumental in bringing about the establishment of a number of important mills and factories. There were, in 1910, 12 cities with a population of over 50,000. There were also 43 cities and towns having a population of over 10,000 but less than 50,000. These 55 cities and towns contained 77.4 per cent of the total population and were credited in 1909 with 82.9 per cent of the total value of its manufactures.

The raw materials used in the manufacturing industries of Massachusetts are for the most part produced elsewhere, and most of its manufactured products are sold for consumption beyond its borders. It has excellent steam-railway facilities (see *Transportation*), and the network of electric railways is not only an important factor in connection with its manufactures, but adds greatly to its facilities for local trade. Massachusetts in 1909 was surpassed only by New York, Pennsylvania, and Illinois in the value of manufactured products. The table on page 206 gives the most important figures relative to manufactures in 1909 and in 1904.

There were, in 1909, 76 industries or industry

groups for which products valued at more than \$50,000 were reported. These industries include four with products exceeding \$50,000,000 in value, six with products between \$25,000,000 and \$50,000,000 in value, and 16 with products between \$10,000,000 and \$25,000,000 in value, making an aggregate of 26 industries with a value of products in excess of \$10,000,000 each. There were in addition 15 industries with products between \$5,000,000 and \$10,000,000 in value, 23 with products between \$1,000,000 and \$5,000,000

felt hats; and shoddy. Combined, the eight allied industries gave employment in 1909 to an average of 192,147 wage earners, and the value of their products amounted to \$387,063,000. Massachusetts is not only the foremost State in the Union in the production of all textiles combined, but is first as regards three of the most important branches—cotton goods, including cotton small wares; woolen, worsted, and felt goods and woolen hats; and cordage and twine and jute and linen goods. It ranks third in the

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — FIFTEEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture

in value, and 12 with products between \$500,000 and \$1,000,000 in value.

While a few industries predominate, there are a very large number which are of considerable importance. The leading products, measured by value, are boots and shoes, cotton goods, woolen goods, and foundry and machine-shop products. The textile industries considered as a whole much exceed boots and shoes in importance. They comprise chiefly the manufacture of cotton goods, including small cotton wares; woolen, worsted, and felt goods, and woolen hats; cordage and twine and jute and linen goods; hosiery and knit goods; carpets and rugs, other than rag; silk and silk goods, including throwsters; fur-

production of carpets and rugs and fifth in silk and silk goods and in fur-felt hats. In addition to the manufacture of textiles there are large industries which are engaged in the dyeing and finishing of textiles, which includes the bleaching, dyeing, and mercerizing of raw fibres, yarns, and woven cloth, as well as the printing of cotton piece goods. These rank twelfth among the industries of the State, as measured by value of products, which was \$21,893,000. The manufacture of cotton goods is the most important among textile industries. There were engaged in these manufactures 9,377,984 spindles and 234,249 looms. The cotton consumed during 1909 amounted to 622,368,027 pounds. Although

the manufacture of cotton goods under the factory system in the United States began in Rhode Island in 1790, the introduction in 1814 of the power loom and at about the same time of the dressing machine in Waltham, Mass., marked the beginning of the real growth of the industry. The manufacture of woolen, worsted, and felt goods and wool hats is second in importance among the textile industries. The manufacturing processes involved in the production of woolen and worsted goods in the United States were largely perfected in Massachusetts. As early as 1839 there were 144 mills in operation in the State. In 1909, 156,338,534 pounds of wool were consumed in this industry. Although the major part of the wool consumed is domestic wool, the relative increase in foreign wool has been more rapid, particularly for the period 1904-09. The manufacture of cordage and twine and jute and linen goods ranks third among textile manufactures, and hosiery and knit goods fourth. The first stocking factory in the United States was established at Newburyport in 1831. The principal products of the carpet factories in the State are Wilton, Axminster, and Brussels carpets, and of the silk mills, plain and fancy silk-mixed broad silks.

Measured by value of products, the manufacture of boots and shoes is the most important industry. In 1909, 102,826,648 pairs of boots and shoes were produced in the factories of Massachusetts. This is 41.5 per cent of the total number reported for the United States. Of the 860 establishments connected with this industry 469 were engaged primarily in the manufacture of boots and shoes in 1909, 215 in the production of boot and shoe findings, and 176 in the manufacture of boot and shoe cut stock. Although this industry is one of the oldest in the State, dating from about 1629, it was not until after the period from 1851 to 1865, when various kinds of shoemaking machinery were introduced, that the real expansion of the industry began. Massachusetts leads all other States in the combined industry and in each of the three separate branches.

The development of industries connected with foundry and machine-shop products has been in a measure dependent upon, and largely stimulated by, the growth of the textile, boot and shoe, printing and publishing, paper and wood pulp, and other important industries which employ machinery extensively in their manufacturing processes. A large part of the machinery used in the United States for these industries, particularly in the first two, is manufactured in the State.

Massachusetts is one of the most important of the States in the manufacture of paper and wood pulp. The mills engaged in the production of paper alone largely predominate. This branch of industry was developed and brought to its high standard of efficiency mainly in Massachusetts, and for many years it has ranked among the principal manufacturing activities.

The leather industry includes establishments primarily in the manufacture of leather and those which treat hides or skins for others. Calf and kid skins constitute the most important class of material used in these manufactures. Massachusetts ranks third in the Union in this industry with respect to value of products.

While neither the manufacture of men's clothing nor that of women's clothing is among the 10 leading industries, the two industries com-

bined had in 1909 an output valued at \$30,042,000.

In the manufacture of electrical machinery, apparatus, and supplies, Massachusetts is of leading importance. In 1909 the allied industries engaged in the manufacture of jewelry, silverware, and plated ware, and in the reducing and refining of gold and silver from clippings, sweepings, and scrap, combined, employed an average of 9966 wage earners and turned out products valued at \$23,109,000. This group had its beginning about 1805, the chief finished products at that time being such articles as silver spoons, gold beads, and finger rings, and later included a cheaper grade of jewelry, in the manufacture of which Massachusetts is now one of the leading States. It leads all other States in the production of rubber footwear. In addition to the industries named there are five others in which, though they are not among the leading ones of the State as measured by value of products, Massachusetts leads all other States of the Union. These industries are the manufacture of paper goods outside of paper mills; the manufacture of cutlery and tools; the manufacture of whips; the manufacture of bicycles, motor cycles, and parts; and the making of shoe lasts.

The total number of wage earners in 1909 was 584,559, of whom 401,172 were males and 183,387 were females. The wage earners under 16 years of age numbered 20,735, of whom about half were males. In the carpet and rug and cotton-goods industries and in the manufacture of cordage and twine over two-fifths of the wage earners are women 16 years of age and over; in the knitting mills, over one-half; in the silk mills, nearly three-fifths; and in the woolen and worsted mills, nearly two-fifths. Of the wage earners employed in the manufacture of boots and shoes, including cut stock and findings, nearly one-third are women 16 years of age and over. For a great majority of the wage earners employed in the manufacturing industries the usual hours of labor are between 54 and 60 a week.

Boston is of course the most important city as measured both by the number of wage earners and the value of products. There were in that city, in 1909, 69,637 wage earners, and the value of products was \$237,457,472. Lawrence held second place in importance in 1909. Worcester is the third city in rank according to value of products, and Lynn ranks fourth. Lynn, Brockton, and Haverhill, with the exception of St. Louis, Mo., which held third place in 1909, are the three most important centres of the boot and shoe industries of the United States, ranking in the order named. Fall River, Lowell, and New Bedford, which in the value of manufactured products in 1909 ranked fifth, sixth, and seventh, respectively, in the State, owe their prominence primarily to the manufacture of cotton goods. These three cities lead all others in the United States in the manufacture of this class of textiles. Cambridge is an important manufacturing city, but it is dependent upon no one industry for its industrial position. Holyoke is the centre of the paper industry in the State and also the leading city in the United States in the manufacture of fine paper. The manufacture of all textiles combined, however, is even more important in Holyoke than the paper industry. Other important manufacturing places are Somerville (q.v.), which outranks all others in the slaughtering and meat-packing

industries, Springfield, Fitchburg, Chelsea, Peabody, Woburn, Taunton, Plymouth, Webster, North Adams, Clinton, Northampton, Adams, Newton, Methuen, Pittsfield, and Attleboro. These by no means include all the important manufacturing cities of the State. Nearly all cities, and many towns, are engaged in important manufactures of some sort. Further information in regard to these cities and towns will be found in their alphabetical place in other portions of this work.

Transportation. Massachusetts is well provided with transportation facilities both by land and by water. Most of the railway lines centre in Boston and the mileage for the eastern end of the State is greatly in excess of that of the other parts. The first railroad in the United States was the Quincy Railroad, 3 miles long, constructed in 1826-27 to convey granite from the Quincy quarries for the Bunker Hill Monument. It was not, however, operated by steam. The Boston and Lowell steam railroad was opened in 1835. At about the same time roads were built to Providence and to Worcester, and by 1842 the latter line had been extended to Albany. One of the most important public works ever undertaken by the State was the construction of the Hoosac Tunnel (see TUNNEL) completed in 1873. The total mileage of track of all kinds in 1914 was 4927, of which 2125 was main-line track. There were in 1914 three important railway companies—the Boston and Albany, 961; Boston and Maine, 1967; and New York, New Haven, and Hartford, 1833. By a process of amalgamation which forms an interesting chapter in railroad history the Boston and Maine and most of the important trolley and steamship lines were acquired by the New York, New Haven, and Hartford Railroad. This corporation continued to hold them until 1914, when it was compelled by the United States government to relinquish its control over the Boston and Maine and its other holdings in the trolley and steamship companies in New England. (See RAILWAYS.) The development of electric railways has been an important factor in connection with manufactures, and they have added greatly to the facilities for local trade. The electric railway mileage in 1912 was 2328. The railways are under the supervision of a State Public Service commission, which has the power to regulate rates and charges.

The State has been generous in the construction and repair of highways. In 1912 the highway commission was authorized to issue \$5,000,000 in scrip for the construction of State highways from 1913 to 1917. Maritime commerce has from the earliest days of the history of the State been of the greatest importance. Boston, the second seaport in importance on the Atlantic coast, furnishes excellent opportunities for domestic and foreign commerce. The Cape Cod Canal, which shortens the distance between Vineyard Sound and Boston by 70 miles, was formally opened in July, 1914. (See CANAL.) Several other cities and towns have good water facilities, which augment to some extent the water traffic to and from Boston and ports outside the State. Maritime commerce dates from the first days of the colony. As early as 1631 Governor Winthrop launched, for coast trade, a bark called the *Blessing of the Bay*, and a few years later vessels were plying regularly between the various ports. Early in the eighteenth century there was a large West Indian trade. Many ships

were also built for the French and Spaniards, who paid for them largely in rum and molasses. After the Revolution an immense trade with the East Indies and with the African coast was developed. Still later, notably between the years 1840 and 1860, the clippers built at East Boston and Newburyport were the fastest ships then known, and carried on no small share of the world's freighting. The outbreak of the Civil War, however, nearly paralyzed the commerce of American shipowners, and it has never fully revived. There are several lines of steamers running from New York to Boston. There are also several steamship lines connecting with Europe and the West Indies. The customs districts are Barnstable, Boston, and Charlestown, Fall River, Gloucester, Marblehead, New Bedford, Newburyport, Plymouth, Salem, and Beverly. The total imports received in Boston and Charlestown in 1913 amounted to \$146,599,451, and the exports from these ports were valued at \$69,552,657.

Banks. The first commercial bank in the Colonies is said to have been established in Boston in 1686. The Massachusetts Land Bank was started in 1739, but all Colonial banks were prohibited in 1740. The Massachusetts Bank, organized in Boston in February, 1784, was the first local bank in the State and the second in the Union. The Union Bank of Boston was chartered in 1792. By the beginning of the nineteenth century five banks had been incorporated in the State. Massachusetts was the first State to require (1803) semiannual bank reports to be sworn to by the directors. Thus its banks were put on a firmer basis and passed through the panic of 1808-09 in better shape than the other New England banks as a rule. In 1814 again the Massachusetts banks showed their superior strength. A comprehensive banking law was enacted in 1829, with stringent provisions as to capitalization and limits of circulation. Yet these were evaded during the speculative régime of 1830-36; as a consequence in the financial depression 1837-44, 32 banks failed. In 1838, however, a system of official examination of banks by a board of bank commissioners was adopted. The banking law of 1857 provided for one commissioner. Under this improved system there was only one bank failure in the panic of 1857. When the system of national banks was introduced State banks of discount were prohibited and do not exist at present. The necessity for loans on real estate (which the national banks are prohibited from making) led to the development of trust companies. Savings banks are numerous and popular, and their investment and general management are strictly regulated by law. On Sept. 12, 1914, there were 172 national banks, with capital \$55,842,500, surplus \$36,403,925, cash, etc., \$11,163,699, loans \$347,016,143, and deposits \$327,909,915; 69 loan and trust companies, with an aggregate capital of \$25,438,800, surplus of \$22,666,025, cash \$23,428,307, loans of \$242,351,487, and deposits \$296,104,997; 196 savings banks, with 2,305,340 depositors and deposits of \$895,178,637.

Government. The constitution of Massachusetts was agreed upon by delegates of the people in convention which was held at Cambridge between Sept. 1, 1779, and March 2, 1780, when the convention adjourned to meet on the first Wednesday of the ensuing June. In the meantime the constitution was submitted to the people, who approved of it by a two-thirds vote.

The constitution has been amended many times. Amendments may be proposed in the General Court, and if agreed to by a majority of the Senators and two-thirds of the members of the House of Representatives present and voting thereon, are referred to the next General Court. If this court agrees to the proposition in the same manner it shall be submitted to the people, and if approved by them by a majority vote, becomes a part of the constitution.

Legislative.—The legislative department consists of a Senate and a House of Representatives and is known as the General Court of Massachusetts. The General Court meets every year on the first Wednesday in January. The House of Representatives consists of 240 members apportioned to the several counties of the Commonwealth. The Senate is the first branch of the Legislature. It has power to try all impeachments brought by the House. The two-thirds veto of each House overrides the Governor's veto.

Executive.—The supreme executive magistrate is the Governor. He is chosen annually, and at the time of his election must have been an inhabitant of the Commonwealth for seven years next preceding. There is a Council composed of eight members, elected annually for the purpose of advising the Governor, which exercises the power of chief executive when both the offices of Governor and Lieutenant Governor are vacant. Other executive officials are the Secretary, Treasurer, Receiver General, Auditor, and Attorney-General. They are elected annually and hold office for the same length of time as the Governor.

Judiciary.—Judicial officers are appointed by the Governor with the consent of the Council and they hold office during good behavior. They may be removed from office by the Governor upon the address of both Houses of the Legislature. The supreme judicial court consists of a Chief Justice and six associate justices. The superior court consists of a Chief Justice and 15 associate justices. Each county has a probate court and a court of insolvency, which are distinct in their jurisdiction, powers, etc., but have the same judge and register. These courts are held by the judge of probate and insolvency appointed for the county, but the judges of the several counties may, in case of necessity or convenience, interchange services.

Suffrage and Elections.—Every male citizen of 21 years of age and upward, excepting paupers and persons under guardianship, who shall have resided within the Commonwealth one year and within the town or district in which he may claim a right to vote six calendar months next preceding any election of Governor, Lieutenant Governor, Senators, or Representatives, has a right to vote. No person shall have the right to vote or be eligible to office under the constitution who shall not be able to read the constitution in the English language and write his name. These provisions do not apply to any person prevented by physical disability from complying with its requisitions. The election for the choice of Governor, Lieutenant Governor, Senators, and Representatives is held on the Tuesday next after the first Monday in November, annually. The Legislature of 1907 passed an Act codifying the laws relative to caucuses and elections. In every city except Boston there is a board of registrars of voters, consisting of four persons appointed by the mayor with the

approval of the board of aldermen, and in every town having less than 300 voters registered, the selectmen and the town clerk constitute a board of registrars of voters. Each political party annually elects a State committee, the members of which hold office for one year from the first day of January next following their election. Cities and towns may adopt the provisions of the law for nominating by primaries. Nominations of candidates for any offices may be made by nomination papers and signed in the aggregate by not less than 1000 voters for each candidate. There is a State ballot-law commission, consisting of three persons appointed by the Governor for a term of three years. The names of all candidates except for presidential electors must be arranged under the designation of the office in alphabetical order. There are severe penalties for corrupt practices in elections. Nominations for Senator or Representative are made by a direct plurality vote in accordance with an Act approved by the people in 1910, and by the terms of a provision passed in 1911 the nomination of candidates of political parties for all offices to be filled by State election except the office of presidential elector and the election of district members of State committees, members of ward and town committees, and of delegates to State conventions of political parties, shall be by direct plurality vote in primaries. Business corporations are prohibited from making political contributions. The Legislature of 1912 passed a measure providing for the direct election of delegates to national conventions and making provision for the expression of preference for candidates for President and Vice President of the United States. The Legislature of 1913 amended the election laws so as to permit questions of instruction on public policies to be submitted to the voters on the official ballot. Women have the right to vote for school committees.

Local and Municipal Government.—Municipal governments may be established by the General Court in towns exceeding 12,000 population, with the consent and upon the application of a majority of the inhabitants. Unincorporated towns are governed by selectmen elected annually at town meetings. Cities and towns may adopt the commission form of government.

Miscellaneous Constitutional, and Statutory Provisions.—Wilful desertion for three years, failure to provide for that period, and habitual drunkenness are among the causes for which divorces are granted. It is unlawful for any person, partnership, or association to require an employee engaged in any commercial occupation to do on Sunday the usual work of his occupation unless such employee is allowed during the six days next ensuing 24 consecutive hours without labor. Gambling and betting in public places are forbidden. There are strict child-labor laws and measures providing for workmen's compensation and labor arbitration. The manufacture and sale of cocaine are prohibited. There are stringent laws against white-slave traffic. Women, and children under 18 years of age, are prohibited from being employed more than 54 hours a week in manufacturing or mechanical establishments. Every town and city of more than 10,000 inhabitants is required to maintain a dispensary for the discovery, treatment, and supervision of needy residents afflicted with tuberculosis. Counties are permitted to establish pension systems for their employees.

There is a retirement system for State employees, which is practically an assisted old age pension. There are stringent pure-food laws, and the Legislature of 1913 passed a measure providing for mothers' pensions. By the same Legislature a uniform marriage law was passed. The sale of liquor in the State is regulated by municipal and town local option laws which went into effect in 1881.

Finance. In matters of finance and taxation Massachusetts has always been one of the most progressive of the States. The Colony in 1646 introduced a system of direct taxation and a poll tax, and soon after a "faculties" tax, which had income as a basis. The first Treasurer's report was published in 1655. When Massachusetts was reorganized in 1690 under a provincial charter direct taxation upon property and a poll tax were again made the main foundation of the revenue system. In the middle of the eighteenth century lotteries were established for many extraordinary and even normal needs of the Treasury. The system was abandoned in 1765, only to be reestablished at the advent of the Revolution. The direct debt in 1786 was \$5,000,000 and the State's share of the national debt was as much more. The immediate current liabilities in that year were \$1,500,000. A large part of this debt was, however, assumed by the Federal government in 1790. Up to 1794 the State debt was almost canceled. In the early part of the nineteenth century a well-regulated system of taxation of corporations grew up. In 1812 banks were taxed, and insurance companies after 1832. During the Civil War the public debt greatly increased. At one time it amounted to more than \$32,000,000. By 1871, however, it had been reduced to \$16,573,000, for the payment of which there was created a sinking fund of \$8,261,000. On account of many railroad loans and other public improvements the debt again grew rapidly in the seventies, but it was always well provided by the sinking fund. On Dec. 1, 1914, the debt amounted to \$112,964,662. The sinking-fund assets amounted to \$38,263,060, leaving the net debt \$84,701,602. This may be divided into two parts—the direct debt, which is an obligation incurred for the benefit of the entire State, and the contingent debt, which, while a direct debt, has been incurred for the benefit of 41 cities and towns in the vicinity of and including Boston, called the metropolitan district. This was incurred to aid in the administration of certain improvements, such as the construction of water, sewer, and park systems, etc. The various cities and towns benefited refund this amount by means of sinking-fund assessments levied by State boards of commissioners and paid at the same time and in the same manner as State taxes. The per capita debt, which in 1880 was \$11.66, had increased to \$23.49 in 1914. Massachusetts has a larger debt than any other State except New York. The report of the Receiver General showed a cash balance on hand on Dec. 1, 1913, of \$8,220,590. The total receipts for the fiscal year 1914 amounted to \$43,241,099 and the total expenditures were \$43,386,669, leaving a balance on hand on Dec. 1, 1914, of \$8,075,020.

Militia. In 1910 there were 760,324 men of militia age. The organized militia numbered 452 officers and 5341 enlisted men.

Population. The population by decades has been as follows: 1790, 378,000; 1800, 422,000; 1810, 472,000; 1820, 523,000; 1830, 610,000;

1840, 737,000; 1850, 994,000; 1860, 1,231,000; 1870, 1,457,000; 1880, 1,783,000; 1890, 2,238,000; 1900, 2,805,000; 1910, 3,366,416. Population on July 1, 1914, was 3,605,522; 1920, 3,852,356. In 1910 Massachusetts ranked sixth in population among the States. In density of population it ranked second, with 418.8 persons to the square mile. The native-born white population with native parents was 1,103,429, being 32.8 per cent of the total. The native whites of foreign or mixed parentage numbered 1,170,447. There were 1,051,050 foreign-born whites, representing 31.2 per cent of the total population, and 38,055 negroes. The rural population was 241,049. Until the middle of the nineteenth century the people of Massachusetts were almost wholly of English descent. Two movements, however, wrought a vast change with respect to race. The first of these was a migration westward of the native population. The other was the great influx of foreigners, chiefly from Ireland and Canada, those from the latter country being mainly of French descent.

The growth of the manufacturing industries has resulted in a large urban population. Unlike most States, females formed the majority of the population. This is due chiefly to the westward emigration and an increased opportunity for females to find employment in the mills and at domestic service. The total number of males in 1910 was 1,655,248, and of females 1,711,168. There were, in 1910, 71 cities or towns having a population of 8000 or over. This is larger than the number contained in any other State. In 1910 the population of Boston (q.v.), the largest city, was 670,585. The estimated population of the city in 1914 was 733,802. Other large cities with their estimated populations in 1914 are as follows: Worcester, 157,732; Fall River, 125,443; Lowell, 111,004; Cambridge, 110,357; New Bedford, 111,230; Lynn, 97,207; Springfield, 100,375; Lawrence, 95,834; Somerville, 83,881; Holyoke, 62,852; Brockton, 64,043; Malden, 48,979; Haverhill, 47,071; Salem, 46,994; Newton, 42,455; Fitchburg, 40,507; Taunton, 35,631; Chelsea, 32,452. All of the above are estimates of the United States Census Bureau.

Education. The establishment of public schools was one of the first concerns of the settlers of Massachusetts. The first free school was organized in 1635, and Harvard College was founded in the following year. A statute enacted in 1647 provided that each town having 50 families should maintain a school to teach the children to read and write, and that each town having 100 families should provide a grammar school to fit youths for college. This statute was the foundation for all succeeding educational legislation, and it has resulted in a system which is one of the best in the world. The State Board of Education was created in 1837. Its first secretary was Horace Mann, and his reports and labors gave impulse and vigor to the schools of the entire Union. The local unit of organization is the town (township), each having a school committee appointed by the people and a skilled superintendent appointed by the committee. The central coördinating and supervisory body is the State Board of Education, and between it and the local organizations stand the agents of the State Board, each of whom has his particular district or his special phase of educational work to oversee. This system brings about efficiency and uni-

formity. Ample financial support is provided by taxation and by the income from the State school fund, which was established in 1834 from proceeds derived from the sale of lands in the State of Maine, and from the claims of Massachusetts upon the United States for military services. This fund on Jan. 1, 1913, amounted to \$5,000,000. The excellent results obtained from the administration of the school system are shown by the fact that of a total population of 2,742,684 of 10 years of age and over in 1910, the illiterates numbered only 141,541, or 5.2 per cent, and if the foreign-born white population were eliminated the percentage of illiteracy would be only 0.4 per cent, or 3428. Among the negroes of the State the percentage of illiteracy in 1910 was 8.1. According to the thirteenth census the total number of persons of school age (5 to 20 years) in 1910 was 941,376, and of these 614,105 attended school. According to figures furnished by the State Board of Education the number of different pupils of all ages in public schools during the school year ending July 1, 1913, was 557,211. The total number of teachers on that date was 16,979, of whom 15,292 were females and 1687 were males.

In 1909 the Board of Education was reorganized and a commissioner and two deputies were appointed. Towns which have a valuation not exceeding \$2,500,000 share in the income of the State school fund. Such towns are also required to belong to superintendency unions, the superintendents of which are paid in part from contributions by the State. A number of these towns also receive aid from the State, either in the shape of the \$500 grant for maintaining a high school or reimbursement for the payment of tuition pupils attending a high school in another town or city. Particular attention has been given to the subject of vocational education. A number of cities in the State maintain day and evening industrial schools.

The number of public day schools on June 30, 1912, was 12,396, and in these were 16,433 teachers. The high schools numbered 270, with 2728 teachers and 69,319 pupils. The total expenditure for high-school support was \$3,990,923. There were 342 evening schools, with 2134 teachers and 63,272 pupils. The total expenditure for public schools in 1912 was \$18,769,204. The cost of the public schools per child in that year was \$30.87. There were 47 incorporated academies, with 7000 pupils. Attendance in academies has decreased owing largely to the increasing excellence of the high schools. The Legislature of 1913 passed a measure of great importance providing for the establishment and maintenance of continuation schools and courses of instruction for working children.

There are State normal schools at Bridgewater, Westfield, Hyannis, Fitchburg, Lowell, and Salem. There is also a State Normal Art School at Boston. While the State system of education does not include higher institutions of learning, excepting normal colleges, these have been amply provided by private enterprise. The oldest collegiate institution is Harvard University at Cambridge. The others are Amherst College at Amherst, Boston University at Boston, Tufts College at Tufts College Station, Medford, Williams College at Williamstown, Clark College and University at Worcester, the College of the Holy Cross at Worcester, and Boston Col-

lege, Boston. Colleges for women are Radcliffe College, affiliated with Harvard University, Cambridge; Smith College at Northampton; Mount Holyoke College at South Hadley; Wellesley College at Wellesley; and Simmons College in Boston. Scientific and technical colleges are the Massachusetts Agricultural College at Amherst (co-educational); the Massachusetts Institute of Technology at Boston; and the Worcester Polytechnic Institute at Worcester. Details in regard to these institutions will be found under their titles. The theological institutions include Andover Theological Seminary, now affiliated with Harvard University, at Cambridge; Newton Theological Seminary (Baptist) at Newton; Harvard Divinity School (nonsectarian) at Cambridge; New Church Theological School at Cambridge; Boston University School of Theology (nonsectarian), under Methodist auspices; Protestant Episcopal Theological School at Cambridge; and Tufts College Divinity School (Universalist) at Tufts College Station, Medford. Medical schools include the Harvard Medical School, the College of Physicians and Surgeons in Boston, Tufts College Medical School, and the Boston University School (homoeopathic). There is an Industrial School for Deaf Mutes at Beverly, and schools for the deaf in Randolph and Northampton.

Charities and Corrections. The charitable institutions are under the direction of the State Board of Charities, and the penal and reformatory institutions are administered by a Board of Prison Commissioners. The institutions under the supervision of the Board of Charities are the State Infirmary at Tewksbury, the State Farm at Bridgewater, the Norfolk State Hospital, the Lyman School for Boys at Westborough, the Industrial School for Boys at Shirley, the State Industrial School for Girls at Lancaster, the Massachusetts Hospital School at Canton, the North Reading State Sanatorium, the Rutland State Sanatorium, the Lakeville State Sanatorium, the Wakefield Sanatorium, and the Penikese Hospital (for lepers) on Penikese Island. The supervisory powers of the board over these institutions extend to the right of investigation and recommendation as to any matters relating to the institutions, but the administration of each is vested in a separate board of trustees. The total number of persons under care in these institutions in 1913 was about 20,000, and the cost of administration is about \$1,500,000 yearly. In addition to these institutions there are many private hospitals and institutions for the education of special classes. These include Perkins Institution and Massachusetts School for the Blind at Watertown, the Massachusetts School for the Feeble-Minded at Waltham, the State Hospital at Tewksbury, the Hospital for Inebriates at Foxborough, and Hospital for Epileptics at Monson. In addition to these there are many city and town almshouses and over 500 voluntary charitable homes and asylums. The prisons include the State Prison in Boston, the Massachusetts Reformatory at Concord, the Reformatory for Women at Sherborn, the prison camp and hospital at Rutland, and the State Farm at Bridgewater. The prison population at the end of 1913 was about 6000. Convicts in the prisons and houses of correction work only under the public-account system. Both in the State and county institutions the labor of prisoners is under the supervision of the General Superintendent of

Prisons. Prison-made goods must be sold to public institutions instead of in the open market.

The State Board of Charities is vested with greater power than is commonly exercised by similar boards in other States, and its administration has resulted in many improvements, such as the curtailment of unnecessary aid, which creates rather than lessens pauperism, and the more judicious treatment of children who may require the attention of State authorities. The tendency in the latter kind of cases is to find homes for or board children in private families rather than in institutions, great care being taken to find proper homes and to keep in close touch with children placed therein.

Religion. In the Colonial period the population belonged mainly to the Congregational church. Before the end of the eighteenth century the Baptists and Methodists had become prominent and are now leading denominations. In the early part of the nineteenth century Massachusetts became the centre of Unitarianism in the United States. With the coming of large numbers of Irish about the middle of the nineteenth century the Roman Catholic church for the first time became prominent, and it is now much stronger than any one of the Protestant denominations. The Episcopalian, Universalist, and Christian Scientist are also leading sects.

History. In 1602 Bartholomew Gosnold (q.v.) effected a settlement on Cuttyhunk Island, between Buzzards Bay and Vineyard Sound, but the colony was abandoned after three weeks. The first successful attempt at colonization was made by a band of Pilgrims, 102 in number, who came from Leyden in Holland. They were a Puritan sect, known as Separatists or Brownists, who had fled from England to Holland in 1608, to escape persecution and, weary of living in a foreign land, had determined to found a place of refuge in America. Through a company of merchant adventurers a patent was obtained from the Council for New England for a settlement within the limits of "Virginia." They set sail from Delftshaven, July 22, 1620, and from Plymouth in England on September 6. It was their intention to settle south of the Hudson River, but storms drove the *Mayflower* to the neighborhood of Cape Cod, and on December 11 (December 21 N. S., the anniversary of Forefathers' Day being celebrated on December 22) the emigrants landed at Plymouth.

Before landing they drew up and subscribed to a compact or frame of government for the new settlement, and elected John Carver Governor for one year. Shortly after landing they entered into a treaty of peace with the Indian chief Massasoit and his tribe, which remained unbroken for a long time. Within four months 44 of the colonists died from exposure to the cold and the lack of wholesome food, and for two years they suffered many privations, but in 1623 they were relieved by a bountiful harvest. Others from the Leyden church joined them and, by 1631, 600 persons—nearly the whole of that body—had emigrated. In 1624 the property of the Colony, which had been held as common, was divided among the settlers; in 1627 the rights of the trading company were bought out, and two years later a patent confirming the colonists' right to the territory they had occupied was issued to Governor Bradford and others. The Colony grew up in practical independence and, organized as a perfect democracy, it car-

ried on its government without any royal sanction. By 1640 there were eight towns with 2500 inhabitants in the Plymouth Colony. Outside the limits of the Colony several scattered settlements were made in Boston harbor between 1623 and 1628.

In 1628 an expedition organized by an English company and commanded by John Endicott landed at Salem. The company had obtained a grant of the territory lying between the Atlantic and Pacific and extending to a point 3 miles south of the river Charles and 3 miles north of the river Merrimac. After persistent efforts a royal patent was obtained for "the Governor and company" of the Massachusetts Bay, and the associates were constituted a body politic, with a Governor, deputy, and 18 assistants to be annually elected, and a general assembly of the freemen, with legislative powers to meet four times in a year, or oftener if necessary. Measures contrary to English laws and statutes were forbidden by the charter, but religious liberty was not named in the document, though this was the ultimate aim of the emigrants. In 1629 the colony was reinforced and the government and patent of the company were transferred from London to New England. The old officers resigned, giving place to others chosen from among those who were about to emigrate, John Winthrop being elected Governor. The Colony grew rapidly. The conflict between the Puritans and Charles I brought about a large emigration to Massachusetts, and between 1630 and 1640 about 20,000 persons arrived in the Colony. Charlestown, Boston, Watertown, Dorchester, Roxbury, Mystic, Saugus (Lynn), and other places were settled at this period. The settlers of Massachusetts Bay, as distinguished from the Plymouth pilgrims, were wealthy, and as a rule of a higher social class. They came in congregations under the lead of their ministers, who were graduates of the English universities. Fraternal relations were quickly established between the two colonies, however. Education was fostered from the beginning. Harvard College was founded in 1636, and in 1642 a system of public schools was organized. Having no charter to occasion disputes, Plymouth Colony prospered peacefully and monotonously, and its history is unmarred by records of religious narrowness; but Massachusetts Bay was in turmoil from the first, owing to its theocratic government and the stern and arbitrary conduct of the magistrates. It was the desire to escape from the yoke of the Massachusetts theocracy that led to the settlement of Rhode Island and Connecticut. Prejudiced by the dissensions between magistrates and people and by the fear that the Colony would become independent, the crown demanded back the charter in 1634; but the colonists evaded the order, made preparations to resist, and were fortunate in having attention diverted from them by the political troubles in England. To strengthen itself, the Bay government exacted an oath of allegiance in 1633-34, and that he had opposed this oath as well as the patent was the main reason for the banishment of Roger Williams (q.v.). The banishment of Anne Hutchinson (q.v.) and the hanging of Quakers were excused by the authorities on the ground that their teachings endangered the stability of the government; and the same spirit was at the basis of the act which made Church membership a qualification for the franchise, and

finally made the Congregational the established church of the Colony (1651). In 1643 Massachusetts Bay united with Plymouth, Connecticut, and New Haven to form the New England Confederacy, for protection against the Indians and the Dutch.

The restoration of the Stuarts was followed by fresh disputes with the crown, but in 1662 the King confirmed the Massachusetts charter and made a conditional promise of amnesty for past political offenses. He insisted, however, upon his right to interfere in the affairs of the Colony, required the complete toleration of the Church of England, the taking of an oath of allegiance, and the administration of justice in his name. Commissioners were sent over from England to investigate the affairs of the Colony, but they met with defiance from the magistrates and could accomplish nothing. The contest with the crown continued in spite of the pressure of the Indian War (1675-76), in which the New England Colonies were plunged. (See PHILIP, KING.) Charles II was incensed at the independent course of the Colony in assuming certain sovereign powers, as it had done in coining money or taking possession of the Maine settlements. The English merchants were irritated by the active trade that was carried on illegally with the West Indies and Europe. Edward Randolph (q.v.) urged on the English government against the Colony, and Massachusetts, under its theocracy, on its side, would make no concession. In 1684 the charter of the Colony was declared forfeited, the General Court was dissolved, and a royal commission superseded the charter government. In 1686 Sir Edmund Andros was made Governor and ruled without restraint and without sense. When news of the landing of William of Orange in England arrived, the people of Boston threw Andros into prison, reinstated the old magistrates, and revived the General Court. In 1692 a new charter was granted uniting Massachusetts Bay and Plymouth. Its terms, however, were less favorable than the old charter, in that the Governor, Deputy Governor, and Secretary were to be appointed by the King, and the members of the Assembly were to be elected by freeholders instead of Church members. In 1692-93 the witchcraft delusion broke out in Salem and vicinity, but the excitement was short-lived and was confined to a limited area. (See WITCHCRAFT.) In 1703-04 and 1722-25 there were wars with the Indians. The Colony aided England zealously in her contest with France, notably in the capture of Port Royal (1690) and of Louisburg (1745). (See PEPPERELL, WILLIAM.) In the early French and Indian wars the settlers of western Massachusetts suffered greatly at the hands of the Indians; towns like Haverhill and Deerfield were subjected to pillage, many of the inhabitants were massacred and the survivors led away into captivity. In 1765 the population of Massachusetts was about 240,000, falling into well-defined classes, but all equal in political power and held firmly together by the consciousness of a common origin and the possession of a common creed. The austerity of seventeenth-century Puritanism had passed away in great measure, but Church and state were still connected, and the Great Revival of 1740 showed how deeply faith lay rooted in the hearts of the people. The first printing press had been brought over in 1639, and a newspaper, the *Boston News Letter*, was issued in 1704. Edu-

cational institutions were being constantly founded. Property was well diffused, though for half a century after 1690 the Colony suffered from a reckless financial policy, which flooded the country with paper money. In resistance to the arbitrary acts of the British Parliament Massachusetts was the pioneer. The struggle against the writs of assistance and the famous speech of James Otis (May, 1761) marked the opening of the contest which ended in independence. The opposition to the Stamp Act, the Boston massacre, the destruction of the tea in Boston harbor, the closing of the port of Boston, and the virtual annulment of the charter followed in rapid succession. In October, 1774, the General Court resolved itself into a Provincial Congress and proceeded to erect an independent State government. The organization of a militia and the storing of supplies led to Lexington and Concord. (For military operations during the Revolution, see UNITED STATES.) In the war Massachusetts took the leading part, though her population was by no means united in the cause of the Revolution. Among the Loyalists who were banished or who voluntarily abandoned their homes were many of the most prominent and wealthy families. In 1780 a constitution was adopted, and by the Bill of Rights, prefixed to it, slavery, as was subsequently decided by the courts, was abolished. In 1786 the rising known as Shays's rebellion, occasioned by heavy taxes and the poverty of the people, occurred in the western part of the State. The Anti-Federalist element in the State was powerful till 1797, and the United States Constitution was ratified in January, 1788, by the close vote of 187 to 168. After 1797 the Federalist party became predominant, the opposition to the War of 1812 was bitter, and delegates from Massachusetts participated in the Hartford Convention (q.v.). The State remained stubbornly Federalist long after the party had disappeared everywhere else, and as a result it took little interest in national affairs. With the passing of the Federalist party greater liberty of thought came into the fields of politics and religion. In 1815 "dissenters" were released from paying taxes to support Congregational ministers, and in 1833 the Congregational church was disestablished. Educational development continued under all régimes. In 1739 Williams College and in 1821 Amherst College were founded, and in 1837 a State Board of Education was created. The antislavery movement had its birth in Massachusetts, and at Boston William Lloyd Garrison (q.v.) began the publication of the *Liberator* on Jan. 1, 1831. Abolitionism grew rapidly after 1840 and was favored in its growth by such episodes as the capture of the runaway slave Shadrach in the streets of Boston in 1851 and of Anthony Burns in 1854. In the Civil War, under the administration of the patriotic Governor, John A. Andrew, the state contributed nearly 160,000 men to the Union armies.

Legislation since the Civil War has dealt largely with the questions of the liquor trade, the regulation of corporations, municipal government, the civil service, and labor. As early as 1853 a law reducing the working day from 12 hours to 10 was passed. Since then the State has been active in caring for the industrial classes, to such an extent, indeed, that after 1895 the depressed condition of the textile trades was attributed by some to the fact that employers were unduly hampered by oppressive

State regulations passed to protect labor and could not meet the competition of the rising manufactures of the South. In 1898 and subsequent years a succession of strikes among the mill operatives caused great distress among the working classes.

The period after the Civil War witnessed the rise of many political movements. The temperance question came into prominence in 1867; the question of the admission of women to the suffrage was agitated up to 1880; the national Labor party exerted great influence in 1878. From 1858 to 1874 the State government was Republican. In 1874 the Democrats elected their candidate for Governor on an antiprohibition platform; in 1882 they were victorious with Benjamin F. Butler as their candidate. In 1890 the revelation of corruption in the Legislature brought about the choice of a Democratic Governor in the person of William E. Russell, whose great popularity caused him to be reelected in 1891 and 1892. Until 1909 the State was Republican by heavy majorities. Curtis Guild, Jr., was elected Governor in 1906 and reelected in 1907. At the presidential election of 1908 Taft carried the State with 265,966 votes to 155,453 for Bryan. Eben S. Draper, Republican, was elected Governor, and was reelected in 1909, but by a greatly reduced plurality, and in the following year he was defeated by Eugene N. Foss, a former Republican, who ran as an independent candidate on a so-called Progressive-Democratic ticket. Mr. Foss made his campaign on the issue of the tariff. The Republicans elected the other State officers. H. C. Lodge, whose term in the Senate expired in 1911, was reelected by the Legislature in January of that year. In the State election in 1911 Governor Foss was reelected and was again the only Democratic official who was successful.

Massachusetts was one of the hardest-fought battle fields in the presidential election of 1912. The Progressive party was aggressive and both Mr. Roosevelt and Mr. Taft made notable addresses. As a result of the division in the Republican party Wilson carried the State with 173,208 votes compared with 155,948 for Taft and 142,228 for Roosevelt. Foss was again reelected governor. The Democrats also elected the Lieutenant Governor and Secretary of State. Mr. Foss was a candidate for reelection again in 1913, but was defeated in the primaries. In the election on November 5 of that year David I. Walsh, Democrat, was elected with 180,460 votes compared with 126,700 for Bird, Progressive, and 116,300 for Gardner, Republican. Mr. Foss, who ran independently, received about 20,000 votes. As a result of this election the Republicans lost their majority in the Lower House, in which the Progressives held the balance of power. In January, 1913, John W. Weeks was elected United States Senator by the Legislature to succeed W. Murray Crane. The Democrats remained in power in 1914, electing their candidate for Governor with 210,442 votes. That the Republicans had made up a great part of their losses of the several years previous was shown by the fact that the Republican candidate, S. W. McCall, received only about 12,000 votes less than the successful candidate. The Progressive vote fell from 142,228 in 1912 to 32,145 in 1914. In national elections Massachusetts has been Federalist, Whig, and Republican, with the exception of the years 1804 (Jefferson), 1820 (Monroe), 1824 and

1828 (John Quincy Adams), and 1912 (Wilson). Colonial and State Governors of Massachusetts:

PLYMOUTH COLONY

John Carver	1620-21
William Bradford	1621-33
Edward Winslow	1633-34
Thomas Prentice	1634-35

MASSACHUSETTS AGRICULTURAL COLLEGE. An institution for agricultural

training, founded at Amherst, Mass., in 1867. The total amount of property owned by the college is 660 acres, of which 175 acres comprise the college campus, 75 acres belong to the experiment station, 100 acres to the horticultural department, and 250 acres to the college farm. The courses given include an extension service connected with a winter course, a summer school, farmers' week, extension schools, and correspondence courses. There is also a graduate school which offers the degree of M.Sc., Ph.D., and M.Agr. The buildings and land belonging to the college were valued in 1915 at \$815,000 and the equipment at \$430,000. It is supported chiefly by appropriations from the State Legislature. There were enrolled in all departments in 1914-15 about 600 students; of these 182 were enrolled in the winter school and 168 in the summer school. The instructors numbered 60. The library contains about 44,000 volumes. The president in 1915 was Kenyon L. Butterfield.

MASSACHUSETTS BAY. A wide, triangular indentation of the eastern coast of Massachusetts, extending from Cape Ann to Plymouth harbor, a distance of about 50 miles, while its depth inland from the middle of this base line to Boston is about 25 miles (Map: Massachusetts, F 3). Its northern shore is rocky, the southern marshy and sandy, and both are irregular and indented by numerous large and small bays, forming the harbors of Gloucester, Salem, Marblehead, Lynn, and Boston. The bay contains a number of islands along the shores, especially in the entrance to Boston harbor. The name Massachusetts Bay is sometimes made to include Cape Cod Bay.

MASSACHUSETTS HISTORICAL SOCIETY. A learned association with headquarters in Boston, the oldest historical society in the country, having been organized in 1791 and incorporated in 1794. Its objects are the collection, preservation, and diffusion of the materials for American history. The first volume of *Collections* was printed in 1792, and this has been followed by 70 more, together with 49 volumes of *Proceedings*. It has also published a new and illustrated edition of Bradford's *History of the Plymouth Plantation, 1620-1647*, in two volumes. The society has a museum of relics and antiquities and a fine library of nearly 60,000 volumes, 120,000 pamphlets and broadsides, a large collection of rare manuscripts made by the late Francis Parkman relating to the history of the French in Canada, and the Winthrop collection of manuscripts relating to early New England history.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. A school of industrial science in Boston, Mass., established in 1861 through the efforts of W. B. Rogers and others, "for the purpose of instituting and maintaining a society of arts, a museum of arts, and a school of industrial science, and aiding generally by suitable means the advancement, development, and practical application of science in connection with arts, agriculture, manufacture, and commerce." The society of arts was the first section of the institute to be established, holding meetings since 1862, and doing much valuable work. The museum of arts has not yet been established, mainly owing to the extraordinary growth of the school of industrial science, which has overshadowed the other departments. On account of the disturbed state of the country during the Civil War the regular courses of instruction

were not opened until 1865. The institute was a pioneer in the introduction of laboratory methods, which are a distinguishing characteristic of its work. In addition to instruction in the sciences and their application to the arts, general studies essential for a liberal education are required. Fifteen distinct courses are offered, each of four years' duration: civil engineering, mechanical engineering, mining engineering and metallurgy, architecture, chemistry, electrical engineering, biology and public health, physics, general science, chemical engineering, sanitary engineering, geology, naval architecture and marine engineering, electrochemistry, and engineering administration. Some of these courses are specially adapted to certain classes of students, such as course XIII A, to which only naval constructors of the United States navy are eligible. Each course leads to the degree of B.S. Within most of the regular courses a considerable latitude is permitted in the selection of branches, a partial choice of professional course being made at the middle of the first year, while in the fourth year nearly the entire time is devoted to professional subjects. Much attention is paid to postgraduate work, with many students from other colleges who have already received degrees. As an example of the special courses provided for such students there may be noted the course in aeronautical engineering.

In 1913 an arrangement was made in coöperation with Harvard University for the maintenance of a School for Health Officers, leading to a Certificate in Public Health (C. P. H.). The studies include engineering courses from the institute curriculum and medical courses at the Harvard Medical School. At the beginning of 1914, by an arrangement made with Harvard University, the university's courses in civil, sanitary, mechanical, electrical, and mining engineering will henceforth be given in the buildings of the institute by technology instructors under the direction of the president of the institute and a faculty comprising the institute professors and those of the university departments affected by the agreement.

The school in 1914-15 had 268 instructors and a total attendance of 1816 students. The library contained 120,000 volumes and 60,000 pamphlets. The institute publishes programmes, catalogues, and reports; the Society of Arts issues *Science Conspectus*; the architectural department is responsible for the *Technology Architectural Record*, and the M. I. T. Alumni Association sends out the *Technology Review*. The students issue a daily, *The Tech*, the *Technology Monthly*, and annuals and occasionals, among the latter, *Concerning Technology*, a students' handbook. The school occupies nine buildings in the Back Bay district of Boston, comprising the Rogers, Walker, and Pierce buildings, three engineering and mechanical laboratories, boiler and power house, and gymnasium, valued with the grounds at \$1,600,000. In September, 1916, the school will remove to its new plant in Cambridge on the bank of the Charles River basin, where on a plot of 50 acres there will be ready educational buildings of three and one-half acres to the floor. The Pratt School of Architecture and the student quarters, including Walker Memorial, dining hall, dormitories, and gymnasium, will be constructed on the completion of the educational portion. The value of the entire plant will be about \$10,000,-

000. The endowment of the institute is \$3,049,975, of which the income of only \$1,613,498 is directly applicable to the current expenses. The income in 1914 was \$705,823; of this amount more than half is derived from student fees, the remainder largely from interest on various funds and gifts from the State of Massachusetts and the United States. The presidents have been: William B. Rogers (1862-70, 1878-81); John D. Runkle (1870-78); Francis A. Walker (1881-97); James M. Crafts (1897-1900); Henry S. Pritchett (1900-07); Arthur A. Noyes (acting, 1907-09); and Richard Cockburn MacLaurin (1909-).

MASSACHUSETTS MEDICAL SOCIETY.

An association with headquarters in Boston, incorporated Nov. 1, 1781, making it the oldest State organization of the kind that has met regularly from the date of founding. Its charter was signed by Samuel Adams as President of the Senate and John Hancock as Governor of the Commonwealth. Its fellows may include all respectable physicians and surgeons of the State who are graduates of medical colleges approved by its council and have been examined by its censors. In 1884 the motion was carried to admit women to membership. Its charter gave it authority to examine all candidates for the practice of medicine and surgery. The society has issued a number of valuable publications, including the *Medical Communications*, issued regularly since 1790, and the *Publications* of the Massachusetts Medical Society, a *Pharmacopœia*, and many reports, essays, a triennial catalogue since 1789, and recently an annual directory of the officers and fellows. The membership of the society in 1915 was 3500. Through its standing committees the society performs important functions in maintaining high standards in the medical profession and in favoring measures before legislative bodies for the improvement of the public health.

MASSACRE OF THE INNOCENTS.

A popular subject with Italian and Flemish painters, representing the slaying of the children of Bethlehem by the soldiers of Herod. Among the most famous examples are those by Guido Reni in the Bologna Gallery; Tintoretto in the Scuola di San Rocco, Venice; Daniele da Volterra in the Uffizi, Florence; Pieter Breughel in the Vienna Gallery; and Rubens in the Munich Gallery. The scene is usually given with much realistic detail, stress being laid upon the endeavors of the mothers to save their infants.

MASSAFRA, mäs-sä'frä. A town in the Province of Lecce, Italy, 12 miles by rail from Taranto (Map: Italy, F 4). The principal articles of commerce are olives, wine, cotton, and fruits. Pop. (commune), 1901, 11,026; 1911, 11,104.

MASSAGE, má-säzh' (Fr. *massage*, from *masser*, Gk. *μάσσειν*, *massein*, to knead). A means of remedial treatment consisting in the manipulation of a part or the whole of the body by friction, stroking, pressing, kneading, percussion, and like movements. When these applications are combined with active or passive movements the process is called the *Swedish movement cure*.

The practice of rubbing and anointing is probably as old as the race. Homer alludes frequently to it. The Egyptians used it. *Massage* in one form or another was one of the luxuries of the baths of the ancient Greeks and Romans. Socrates spoke of the curative properties of olive

oil with friction; Hippocrates laid stress on rubbing and unguents; Asclepiades held that disease was the result of an abnormal arrangement of the atoms which form the human body, and consequently friction, bathing, and exercise would necessarily open the pores and allow the escape of all useless and worn-out atoms and restore equilibrium; Herophilus, Athenæus, Celsus, and Galen gave written rules for such treatment. The Chinese are said to use massage, in place of bleeding, on the theory of producing better circulation. Both the Turks and the Russians combine it with their baths, and their excellent practice has taken its place in our Western civilization. In one form or another massage is in vogue among most peoples, savage and civilized. In Sweden the art has been brought to a high degree of perfection, and it is practiced scientifically throughout the United States.

The manipulations in massage are divided by Metzger into four principal classes: (1) *Effleurage*, or stroking, is carried on with the palms of the hands, with the thumbs, or the tips of the fingers. It consists in lightly stroking the surface in various directions and has a soothing effect on the nervous system, increasing the superficial blood and lymphatic circulation. A procedure carried on in much the same way, but with more vigor, is (2) *Friction*. This manipulation penetrates more deeply than stroking and reaches the subcutaneous tissues and superficial muscles. (3) *Petrissage*, known also as kneading or pinching, is performed with the thumbs and fingers, or the whole hand, portions of the body, such as muscles or groups of muscles, being grasped and manipulated. (4) *Tapotement* (percussion or tapping) may be performed with the palms of the hands, or a chopping movement is made with the ulnar border of both hands. The tips of the fingers may be used with a shoving movement, and lastly the clenched fists are used to beat upon the large groups of muscles of the back of the legs and the gluteal region. General massage is carried on somewhat as follows: Beginning at an extremity, the foot, e.g., the skin is taken up between the thumb and fingers and rolled and pressed; then the muscular masses are well grasped, rolled, and pressed and kneaded, and rapidly tapped; and then each articulation is in turn put through all its motions. Even the muscles of the neck and face may be subjected to the same treatment. Massage by percussion alone consists in applying to various parts of the body a very rapid succession of short blows not forcible enough to cause pain.

The effects of massage are local and systemic. The local effects are the result of the masseur putting forth more or less muscular power, which at the points of contact or friction develops or is transformed into another mode of motion—heat. The action thus induced also serves to elevate the temperature. The blood vessels dilate and an increased quantity of blood enters them, and the motion of the blood current is accelerated. The immediate effect of these changes is to promote the nutritive energy of the tissues subjected to friction. This result is seen in the improved color, warmth, and volume of the parts. All the organic functions are performed with more energy, and power is gained in every way. The effects upon the nervous system are, in general, excellent. For instance, if an inflamed joint is rubbed with extreme

gentleness, the sensibility, at first so acute that the slightest touch would give pain, rapidly subsides, until, after an hour of friction, it may be handled with some roughness, without evoking painful sensations. The acutest suffering is often alleviated by persistent friction of a gentle kind. The state of spasm of a muscle is relieved and relaxation induced by persevering rubbing of the affected muscle. These results are no doubt due to the fact that the gentle titillation of the cutaneous branches of the nerves (end organs) has so far lowered their irritability that they cease to receive and transmit painful impressions. Among the affections which may be either cured or temporarily relieved by massage are wakefulness and nocturnal restlessness, simple headache, or even severe paroxysms of neuralgia, tic douloureux, hemicrania, migraine, spinal pain, infantile paralysis, progressive muscular atrophy, chronic (nontubercular) joint affections, synovitis, contractions, deformities, and thickening from inflammatory deposits in joints and other tissues. See MOVEMENT CURE.

Palmer, *Lessons on Massage* (4th ed., ib., 1912); Douglas Graham, *Massage, Manual Treatment, Remedial Movements, etc.* (4th ed., Philadelphia, 1913); L. L. Despard, *Textbook of Massage* (2d ed., London, 1914).

MAS'SAGE/TÆ (Lat., from Gk. *Μασαγέται*). A nomadic people, allied to the Scythians, who anciently inhabited the broad steppes to the east of the Caspian Sea. Herodotus says that they practiced group marriage; that they sacrificed and devoured their aged people; that they worshiped the sun and offered horses to him; that they lived on the milk and flesh of their herds and on fish; and that they fought on horseback and on foot with lance, bow, and double-edged axe. Cyrus the Great is said to have lost his life in fighting against their Queen, Tomyris, in 529 B.C.

MAS'SALIANS, or **MESSALIANS** (Gk. *Μασσαλιάνοι*, *Massalianoi*, from Syr. *Mašlīm*, they who pray, from *šālī*, to bow). 1. A small non-Christian body in Asia Minor in the fourth century, who held a plurality of gods, but worshiped only one. The name came from the prominence of prayer in their worship. 2. A party of wandering Christian fanatics, of both sexes, who without well-recognized leaders came from Mesopotamia in the fourth and fifth centuries into Armenia, Asia Minor, and Syria, and caused great scandal by begging and their idle mode of life. They renounced marriage and believed that by means of long-continued prayer spiritual purity might be obtained. The Greeks called them Euchites.

MAS'SASAU'GA (North American Indian name). The small ground rattlesnake of the central United States. See RATTLESNAKE.

MAS'SASOIT (?1580-1661). A celebrated sachem of the Wampanoag or Pokanoket Indians, whose territory embraced nearly all the southern part of the present Massachusetts, from Cape Cod to Narragansett Bay. His tribe was said to have been very large at one time, but to have been almost exterminated by disease, so that, on the coming of the whites, it numbered only about 300. On March 22, 1621, he visited Plymouth with 60 warriors and on behalf of the Wampanoags concluded a treaty of peace and mutual protection with Governor Carver. This was sacredly kept by both sides for more than

50 years, and Massasoit himself remained the steadfast friend of the colonists until his death in 1661. He lived at Sowams, within the present town of Warren, R. I., where commissioners from the adjacent settlements often visited him. Consult Virginia Baker, *Massasoit's Town Sowams in Pokanoket* (Warren, R. I., 1904).

MASSAUA, mäs-sou'ä, or MASSOWAH, or MASSAWA. The chief town and formerly the capital of the Italian colony of Eritrea (q.v.). It is situated partly on the mainland, partly on two small islands on the west shore of the Red Sea, 350 miles northwest of the Strait of Babel-Mandeb (Map: Africa, J 3). It is a fortified military station and its commercial importance is very considerable owing to its being the natural port for the northern part of Abyssinia. The climate is excessively hot. The commerce is chiefly with Arabia, Bombay, and the interior of Abyssinia, the chief exports being ivory, coffee, tobacco, wax, and ostrich feathers. Imports and exports in 1911 were valued at 18,845,118 and 9,371,802 lire respectively; transit, 5,234,262 lire. Massaua has steamship connection with Egypt, Italy, and Austria-Hungary. A railway is in operation to the capital of the colony, Asmara, 75 miles distant, and a 63-mile extension to Keren was under construction in 1914. The population was (1908) 2275 (524 Europeans), the natives being Mohammedans of various African and Asiatic races. Massaua formerly belonged to Egypt and was taken by Italy in 1885.

MASSAWA. See MASSAUA.

MASSE, má'sä', FÉLIX MARIE, called VICTOR (1822-84). A French dramatic composer, born at Lorient (Morbihan). He studied under Halévy and Zimmermann at the Paris Conservatory, and won the Prix de Rome in 1844, his composition in the competitive examination being *Le renégat*. In 1860 he was appointed chorus master at the Opéra, and six years later became professor of composition at the Conservatory. By this time he had become one of the commanding personalities of French musical life, and in 1872 became a member of the Institute. He died in Paris, July 5, 1884. A statue of him was erected in his native town in 1887. Masse's music is distinguished for its grace and gayety and its attractive poetic quality. His best operas are: *Les noces de Jeanette* (1853); *Galatée* (1854); *La fiancée du diable* (1854); *Les saisons* (1856); *Paul et Virginie* (1876). Consult A. Pougin, *Musiciens du XIXème siècle* (Paris, 1911).

MASSEAU, má'sô', PIERRE FÉLIX (1869-). A French sculptor, born at Lyons. He became secretary of the National Society of Fine Arts and was a member of the jury on fine arts at the Paris Exposition of 1900 and secretary for decorative art at the Milan Exposition. He was made Chevalier of the Legion of Honor and was awarded several medals. His works comprise: "The Mad Girl of the Sonnet" (1893); "Loulette" (1894); "The Secret" (1896); "Monna," marble head (Dijon Museum, 1897); "Expectation" and "The Post" (1898); "Gisèle," marble bust (1899); "Lunghino" (1901); "The Thinker" and "Beribboned Head" (1902); "Beethoven," bronze bust (1903); "Nymph," "Two Sisters," and "Winged Head" (1904); "Confidence," group (1905); "Education of the Faun" and "Bilitis" (1906); "Bathing Woman," "Leading to Joy," "Apachina" (1907); "Little Daughter of Eve" (1909).

MASSE'NA. A village in the town of the same name, situated in St. Lawrence Co., N. Y., 38 miles by rail northeast of Ogdensburg, on the Grasse and Racket rivers and on the New York Central and Hudson River and the Grand Trunk railroads (Map: New York, F 1). The town includes also Massena Centre and Massena Springs, the latter a popular watering place. Massena has a public library, and among other features of interest are the St. Lawrence Power Company's huge concrete power house and highway bridge (412 feet span and 65 feet above water). The power plant of this concern in 1901 was equipped to generate electrical energy equivalent to 35,000 horse power, and the scheme as projected admits of a very considerable expansion in the event of an increased demand, the water-power development possible here being, next to that of Niagara, the greatest in the United States. The water power is obtained by means of a canal 3 miles long, 200 feet wide, and 18 feet deep, starting at the head of the Long Sault Rapids on the St. Lawrence and emptying into the Grasse River. The chief industries are dairying and the manufacture of aluminium, Massena being the home of the Aluminium Company of America, which has an immense plant here. Settled about 1792, the town of Massena was organized in 1803. Pop., 1900, 2032; 1910, 2951.

MASSÉNA, má'sä'nä', ANDRÉ, DUKE OF RIVOLI, PRINCE OF ESSLING (1758-1817). A marshal of France, born at Nice, May 6, 1758. In his youth he was a ship boy in a small vessel and afterward for 14 years served in an Italian regiment in the pay of France, but left the service in 1789 because his birth precluded him from promotion. He was married and settled at Nice when the French revolutionary wars began, but he at once volunteered and soon rose to be chief of battalion. In December, 1793, he was made a general of division. He distinguished himself in the Italian campaigns of 1794-95, particularly at Loano (Nov. 23, 1795), and in 1796 was put in command of the advance guard of the Army of Italy. He won renown at Arcole (Nov. 15-17, 1796) and Rivoli (Jan. 14, 1797). Bonaparte called him "the favorite child of victory." Masséna resigned his command on account of charges of rapacity, but at the close of 1798 he was put in command of the Army in Switzerland, which operated against the allied Austrian and Russian forces. He defeated the Russians under Korsakoff at Zurich, Sept. 25-26, 1799. In 1800 he was charged with the defense of Genoa, but after an heroic resistance of nearly two months was compelled to surrender the city to the Austrians in June. After the battle of Marengo Bonaparte gave him the command of the Army of Italy. In 1804 he was made a marshal of the Empire. In 1805 he again commanded in Italy, ably manœuvring against Archduke Charles. In 1806 he compelled the surrender of Gaeta, and was largely instrumental in placing Joseph Bonaparte on the throne of Naples. After the battle of Eylau (Feb. 7-8, 1807) Masséna commanded the right wing of the French army, and after the Peace of Tilsit (q.v.) he was made Duke of Rivoli. He subsequently distinguished himself in the sanguinary battle of Aspern (Essling), in 1809, and at Wagram (q.v.) he commanded the left wing of the French army. For these services he was created Prince of Essling. In 1810 he was intrusted with the chief command in Portugal, and compelled the

British and their allies to fall back to Lisbon; but, being unable to make any impression on Wellington's strong position at Torres Vedras, he resigned his command and retired in partial disgrace. His failure he attributed to the disobedience of his lieutenants Ney, Regnier, and Junot. During the Restoration he gave his adhesion to the Bourbons. He died April 4, 1817. His *Mémoires* (7 vols., Paris, 1848-50), edited by General Koch, contain historical matter of interest and value. Consult also: Toselli, *Notice biographique sur Masséna* (Nice, 1869); Edouard Gachet, *Histoire militaire de Masséna* (Paris, 1908); G. Fitzmaurice, "Masséna," in *Royal United Service Association, Journal*, vol. lvii (London, 1913).

MASSENBACH, mä'sen-bäg, CHRISTIAN VON (1758-1827). A Prussian soldier, born at Schmalkalden. He studied in the Military Academy at Stuttgart; became a lieutenant in the Württemberg army in 1778; and entered the service of Frederick the Great in 1782. He accompanied an expedition to Holland in 1787 and served in the war against France in 1792-95. Chief of staff to Prince Hohenlohe in 1806, he was held chiefly responsible for the defeats at Jena and Auerstädt and for the capitulation of the Prince's army. He later took part in Württemberg politics and wrote: *Rück Erinnerungen an grosse Männer* (1808); *Memoiren zur Geschichte des preussischen Staats unter Friedrich Wilhelm II und III* (3 vols., 1809-10); *Denkwürdigkeiten des preussischen Staats seit 1792* (2 vols., 1809). His writings were responsible for his trial on a charge of high treason in 1817 by the Prussian authorities, to whom he had been surrendered, and for his sentence to 14 years' imprisonment. He was pardoned by Frederick William III in 1826.

MASSENET, más'ná', JULES EMILE FRÉDÉRIC (1842-1912). A French composer, born at Montaud (Loire). He was educated at the Paris Conservatory, where he won prizes for his piano-forte playing and for fugue writing. Subsequently he studied under Ambroise Thomas and in 1863 won the Grand Prix de Rome. In 1878 he was made professor of advanced composition at the Conservatory, which post he held until 1896, and in 1878 he was elected to the Académie des Beaux-Arts. In the latter year he made a successful tour of Great Britain. His instrumentation is especially fine, and he is a master of dainty, bizarre effects; but his music lacks real depth, though its euphony and well-defined melody make an immediate appeal, and gained for him exceptional popularity—perhaps not quite deserved when one considers the merit of some of his contemporaries. He published a volume of interesting reminiscences, *Mes souvenirs* (1912). His works include the following operas: *Don César de Bazan* (1872), *Les Erinnyes* (1873), *Le roi de Lahore* (1877), *Hérodiade* (1881), *Manon* (1884), *Le Cid* (1885), *Esclarmonde* (1889), *Le mage* (1891), *Werther* (1892), *Thaïs* (1894), *La Navarraise* (1894), *Sapho* (1897), *Cendrillon* (1899), *Le jongleur de Notre-Dame* (1902), *Ariane* (1906), *Thérèse* (1906), *Bacchus* (1908), *Don Quichotte* (1910), *Roma* (1912), and three posthumous operas *Panurge* (1913), *Cléopâtre* (1914), and *Amadis*. His other works include the cantatas *Marie Madeleine* (1873), *Eve* (1875), *La vierge*, and *Narcisse* (1878); an oratorio, *La terre promise* (1900); orchestral suites, *Scènes hongroises*, *Scènes pittoresques*, *Scènes dramatiques*, after

Shakespeare, and several orchestral overtures, notably to Racine's *Phèdre*; also many collections of songs. Consult: L. Schneider, *Massenet* (Paris, 1908); H. T. Finck, *Massenet and his Operas* (New York, 1910); A. Pougin, *Massenet* (Paris, 1913).

MASSETER. See JAWS.

MASSEY, GERALD (1828-1907). An English poet, born at Gamble Wharf, near Tring, Hertfordshire, of poor parents who gave him little education. When eight years old he was placed in a silk mill, where he worked 12 hours a day. At 15 he found employment in London as an errand boy, and soon began writing verse. Stirred by the Chartist movement and the revolution of 1848, he started a weekly paper called the *Spirit of Freedom*, which was devoted to the interests of workingmen; joined the Christian Socialists, and was encouraged in his undertaking by Kingsley and Maurice. He afterward lectured on spiritualism in England, the United States, and Australia. Among his poems are: *Voices of Freedom and Lyrics of Love* (1850); *The Ballad of Babe Christabel, and Other Poems* (1854); *Havelock's March, and Other Poems* (1861); *A Tale of Eternity, and Other Poems* (1869); *My Lyrical Life* (collected poems, 1889). We may mention, also, many contributions to the periodicals, and several volumes of prose, as, *Shakespeare's Sonnets never before Interpreted* (1866); *Concerning Spiritualism* (1872); *The Secret Drama of Shakespeare's Sonnets* (1888). Massey's social verse now appears bombastic; his dramatic songs and lyrics are often sweet and beautiful.

MASSEY, HART ALMERNI (1823-?1897). A Canadian manufacturer. He was born in Haldimand Township, Northumberland Co., Ontario, and was educated at Watertown, N. Y., and at Victoria College, Cobourg, Ontario (1842-44). While assisting in the management of his father's farms he resolved to devote himself to improvements in agricultural machinery, and after several years' experience in a factory started by his father at Newcastle, became sole owner in 1855. He produced the first reaping and mowing machines made in Canada, and by a number of notable improvements brought the manufacture of agricultural implements in the Dominion to a high state of efficiency. He received prizes at the Paris Exhibition, and in 1876 one of his machines received the highest award at the Centennial Exhibition, Philadelphia. The business was incorporated in 1870 and in 1879 was removed to Toronto. A binder, a rake, and a harvester were added to the number of improved implements; and at Antwerp, Belgium, Massey received the highest award at the International Exhibition in 1885. The latter part of his life was noteworthy for its discriminating interest in and promotion of educational and religious work. He gave largely to missions, hospitals, libraries, churches, and educational institutions, especially to Victoria University.

MASSI, mäs'sê, GENTILE. An Italian painter. See GENTILE DA FABRIANO.

MAS'SICOT (Fr. *massicot*, from *masse*, Lat. *massa*, mass, lump, from Gk. *μαῖφα*, *maza*, barley cake, from *μάσσω*, *massein*, to knead). A natural lead monoxide, yellow in color. It is found massive, usually with a crystalline and shining surface, which, when broken, shows a scaly texture. Artificial crystals of massicot have been obtained among furnace products and by direct chemical methods.

MASSILIA. See MARSEILLES (towards the end).

MASSILIEN'SIS, JOHANNES. See CASSIANUS.

MAS'SILLON. A city in Stark Co., Ohio, 72 miles by rail south of Cleveland and 8 miles west of Canton, the county seat; on the Tuscarawas River, the Ohio Canal, and the Pennsylvania, the Wheeling and Lake Erie, the Northern Ohio Traction and Light Company, and the Baltimore and Ohio railroads (Map: Ohio, G 4). It is the centre of the noted Tuscarawas Valley coal field, and in its vicinity are several quarries of valuable white sandstone. The industrial plants produce extensively farming implements and machinery, stationary and portable engines, iron bridges, bar iron, glass bottles, stoves and heating furnaces, silos, steel washers, steel sheets, wire baskets, power-plant specialties, steam hammers, fire and paving brick, aluminium and enameled ware, paper, and steel tubing and pipe. In Massillon are the State Hospital and Asylum for the Insane, a city hospital, and a public library, besides several parks. Massillon was founded in 1825, was incorporated as a village in 1853, and was chartered as a city in 1868. The government is administered by a mayor, elected biennially, a unicameral council, and directors of service and safety, who, with the mayor (by whom they are appointed), constitute a board of control. The board of education is independently elected by popular vote. Pop., 1890, 10,992; 1900, 11,944; 1910, 13,879; 1920, 17,428.

It was named by Mrs. James Duncan after Father Jean Baptiste Massillon (q.v.), the noted French divine.

MASSILLON, mā'sē'yōn', JEAN BAPTISTE (1663-1742). A distinguished French bishop and preacher, born at Hyères, June 24, 1663. He entered the Congregation of the Oratory in 1681, and while engaged in teaching theology in the diocese of Meaux he delivered an eloquent funeral oration on the Archbishop of Vienne, which led to his being called to Paris and placed at the head of the seminary of Saint-Magloire. There a course of conferences, delivered in the seminary, established his reputation. He was twice called to preach in the presence of Louis XIV at Versailles. He preached funeral orations on the Prince of Conti, the Dauphin, and Louis XIV. In 1717 Massillon was named Bishop of Clermont, and was appointed to preach before the young King Louis XV, for which occasion he composed his celebrated *petit carême*—a series of 10 sermons. In 1719 he was consecrated Bishop and was elected a member of the French Academy. After 1723 he lived almost entirely in his diocese of Clermont, where his charity, gentleness, and amiable disposition gained him the affections of all. His works, consisting mainly of sermons and other similar compositions, were collected in 15 volumes, by his nephew, and published in 1745-46; later editions have appeared in great numbers, the best being that of the Abbé Guillon (Paris, 1828) and that of Blampignon (ib., 1886). The latter has also published a biography, *Massillon d'après des documents inédits* (ib., 1879).

MAS'SINGBERD, FRANCIS CHARLES (1800-72). Chancellor of Lincoln. He was born in Lincolnshire; was educated at Rugby and at Magdalen College, Oxford, and, after graduation with high honors, entered the Church and in 1825 became rector of South Ormsby in his native county. He was made a prebendary in Lin-

coln Cathedral in 1847 and chancellor in 1862. As chancellor he strove to improve the practical efficiency of the cathedral. He was early and prominent in the movement for the restoration of the deliberative functions of convocation, with reference to which he published in 1833 *Reasons for a Session of Convocation*. In addition to many papers and discussions on ecclesiastical subjects he was the author of: *Church Reform* (1837); *The Educational and Missionary Work of the Church in the Eighteenth Century* (1857); *History of the Leaders of the English Reformation* (1842; 4th ed., 1866); *The Law of the Church and the Law of the State* (1859); *Lectures on the Prayer-Book* (1864); *Sermons on Unity, with an Essay on Religious Societies* (1868).

MASSINGER, mäs'sin-jēr, PHILIP (1583-1640). An English dramatist, son of Arthur Massinger, a retainer of Henry Herbert, second Earl of Pembroke. The elder Massinger was educated at St. Alban Hall, Oxford; was afterward a fellow of Merton College and member of Parliament. Philip entered St. Alban Hall in 1602, but he left without a degree in 1606, the year in which his father probably died. Massinger went to London, probably not before 1610, and began writing for the stage. The extent of his work has not been definitely determined, for he collaborated on a large scale. He seems to have written single-handed about 15 plays, and in conjunction with others fully 25. His most common collaborator was Fletcher; and certain of the plays they wrote together must be sifted from those that have long passed under the name of Beaumont and Fletcher. Massinger studied his art well, and skillfully adjusted his plays to the stage. In the art of construction, indeed, he ranks high. As much cannot be said for his characterization, which is stiff and unnatural and distorted by the obvious determination of the dramatist to bend the creatures of his fancy to fit a moral aim and the illustration of ethical problems. His best-known comedy, *A New Way to Pay Old Debts* (first performed between 1622 and 1626), kept the stage well on into the nineteenth century. Sir Giles Overreach, the leading character in the play, is without much doubt a portrait of a notorious extortioner of the time named Sir Giles Mompesson. Political satire is one of the characteristics of Massinger's plays, particularly of *Believe as you List*, *The Emperor of the East*, *The Maid of Honour*, and *The Bondman*. In the last-named play (performed late in 1623 or early in 1624), the object of attack is Buckingham. Good examples of Massinger's power are *The Virgin Martyr* (partly Dekker's) and *Barnavelt* (partly Fletcher's). Through his life he kept up friendly relations with the Herberts. From Philip, the fourth Earl of Pembroke, he received, it is said, a pension of £30 or more. He died at Southwark, in March, 1640, and was buried in the churchyard of St. Saviour's. There is no satisfactory edition of Massinger. The best is by William Gifford (4 vols., 1805; second ed., 1816; reprinted by Cunningham, 1867). Consult also *Dramatic Works of Massinger and Ford*, edited by Hartley Coleridge (London, 1840; rev., 1883), *Selected Plays*, edited by Arthur Symonds, for "Mermaid Series" (ib., 1887-89); and for Massinger's share in plays ascribed to Beaumont and Fletcher, *Transactions of New Shakespeare Society* (London, 1880-86); F. G. Fleay in the last-named publication (ib., 1874); *Biographi-*

cal Chronicle of the English Drama (ib., 1891); A. W. Ward, *History of English Dramatic Literature to the Death of Queen Anne* (New York, 1899); Leslie Stephen, *Hours in a Library* (3d series, ib., 1905); Emil Koeppl, in *Cambridge History of English Literature*, vol. vi (Cambridge, 1910).

MASSINISSA. See MASINISSA.

MASSMANN, mäs'män, HANS FERDINAND (1797-1874). A German philologist, well known for his studies in Old German language and literature. Born in Berlin, he studied there, and, after serving in the War of Liberation, in Jena, where his radical ideas and "demagogic" sympathies brought him into difficulties with the authorities. In 1826 he became a teacher at the Royal Gymnastic Institute at Munich and afterward was chosen professor of Old German literature at the university. At Berlin, whither he had gone in 1842 to introduce gymnastics into the Prussian service, he accepted the chair of Germanic philology. Massmann's writings include editions of *Deutsche Gedichte des 12. Jahrhunderts* (1837-42); *Gottfried's Tristan* (1843); *Kaiserchronik* (1849-53); of the biblical translations of the Gothic Bishop Ulfilas (1855-56) and of Tacitus's *Germania* (1847); *Geschichte des mittelalterlichen Schachspiels* (1839); *Literatur der Totentänze* (1840). Consult article in *Allgemeine deutsche Biographie*, vol. xx (Leipzig, 1884), and Euler and Hartstein, *H. F. Massmann: sein Leben, seine Turn- und Vaterlandslieder* (Berlin, 1897).

MASSON, mäs'sôn', ANTOINE (1636-1700). A French line engraver, born at Louvry, near Orléans. He learned engraving as an armorer's apprentice and had no other teaching. He engraved 68 plates, mostly portraits, of which the most celebrated are those of Count d'Harcourt, known as the "Cadet à la Perle," Gaspard Charrier, and Olivier d'Ormesson. "The Pilgrims of Emmaus," after Titian, known as "The Tablecloth" because of the extreme care with which Masson has rendered the texture of linen, is his most famous subject. His work shows extraordinary facility and great talent for color, but it is often marred by mannerisms.

MAS'SON, DAVID (1822-1907). A Scottish author, born at Aberdeen, Dec. 2, 1822. He was educated at Marischal College, Aberdeen, and at the University of Edinburgh. At 19 he became editor of a Scottish provincial paper. In 1847 he settled in London. He was editor of *Macmillan's Magazine* from 1858 to 1865. In 1852 he succeeded Clough in the chair of English literature at University College and in 1865 retired to accept the professorship of rhetoric and English literature in the University of Edinburgh. In 1893 he became Historiographer Royal for Scotland. Masson is widely known for his studies in Milton, comprising the exhaustive work, *The Life of Milton in connection with the History of his Time* (6 vols., 1859-80; first volume enlarged 1881; index, 1894), and at least four editions of his poems: the Cambridge edition (3 vols., 1874), revised as the Cabinet edition (1890); the Golden Treasury edition (2 vols., 1874), the Globe edition (1 vol., 1877), an intermediate between the Cambridge and the Golden Treasury (3 vols., 1822). The same careful scholarship is displayed in lives of Drummond of Hawthornden (1873) and De Quincey (1878), and in an edition of De Quincey's works (14 vols., 1889-91). Among Masson's other writings are: *Essays, Biographical and Critical*

(1856; reprint, with additions, 1874-76); *British Novelists* (1859), an excellent piece of criticism; *Recent British Philosophy* (1865); *Carlyle Personally and in his Writings* (1885); *Edinburgh Sketches and Memories* (1892). From 1880 to 1899 he edited, with introductions, the *Register of the Privy Council of Scotland*, vols. iii-xv (1578-1627).

MASSON, mäs'sôn', FRÉDÉRIC (1847-). A French historian, born at Asnières. He became librarian of the Ministry of Foreign Affairs and in 1903 was elected to the French Academy. He is particularly known as the historian of the life and times of Napoleon, his writings including: *La révolte de Toulon en prairial an III* (1875); *L'Impératrice* (1877), anonymously; *Le Marquis de Grignan* (1881; 3d ed., 1908), crowned by the French Academy; *Les diplomates de la Révolution* (1884); *Napoléon et les femmes* (1893; 21st ed., 1897), translated as *Napoleon and the Fair Sex* (1894); *Napoléon chez lui* (1894); *Les cavaliers de Napoléon* and *Napoléon inconnu* (1895); *Marie Walewska* (1897); *Joséphine de Beauharnais, 1763-1796* (1899); *Joséphine, impératrice et reine* (1898); *Joséphine, répudiée 1809-1814* (1901); *L'Impératrice Marie-Louise* (1902); *Napoléon et son fils* (1904); *Napoléon et sa famille* (9 vols., 1897-1907); *Le sacre et le couronnement de Napoléon and Autour de Sainte-Hélène* (1908); *Sur Napoléon* (1909); *Napoléon à Sainte-Hélène, 1815-1821* (1912); *L'Académie-Française, 1629-1793* (1912); *Pour l'Empereur* (1913).

MASSON, LOUIS FRANÇOIS RODRIGUE (1833-1903). A Canadian statesman, born in Terrebonne, Quebec. He was educated at the Jesuit College, Georgetown, D. C., and at St. Hyacinthe College, Province of Quebec. In 1859 he was admitted to the bar and he sat in the Canadian Parliament as Conservative member for Terrebonne from 1867 to 1882. From 1878 to 1880 he was Minister of Militia and Defense, in 1880 was President of the Council, and from 1884 to 1887 was Lieutenant Governor of Quebec Province. As Minister of Militia and Defense, he procured the passage of a law establishing cadet companies in the universities, colleges, and high schools of the Dominion. In 1882 and again in 1892 he was summoned to the Senate. He was mayor of Terrebonne and published *Les bourgeois de la compagnie du Nord-Ouest* (1889).

MAS'SON, THOMAS LANSING (TOM MASSON) (1866-). An American editor and author, born at Essex, Conn., and educated in the public schools of New Haven. Engaging in journalistic work in New York, he became literary editor of *Life* in 1893 and a regular contributor of humorous articles to various magazines. As an editor, he was responsible for *Humorous Masterpieces of American Literature* (1904); *In Merry Measure* (1905); *The Humor of Love in Verse and Prose* (1906); *The Best Stories in the World* (1914). His own books are: *The Yankee Navy* (1899); *A Corner in Women* (1905); *The Von Blumers* (1906); *A Bachelor's Baby and Some Grown-Ups* (1907).

MASSON-FORESTIER, mäs'sôn'-fô'rës'tyâ', ALFRED (1852-1912). A French writer, born at Havre. He studied law and from 1884 to 1899 practiced his profession at Rouen. After 1899 Masson-Forestier settled in Paris and devoted all his time to literature, contributing to the *Revue des Deux Mondes*, *Temps*, *La Revue* etc. His stories, usually short and in content

sober, are reminiscent of Merimée and Maupassant. He wrote: *Difficile devoir* (1891); *Pour une signature, etc.* (1892); *La jambe coupée, etc.* (1894); *Remords d'avocat* (1896), crowned by the French Academy; *Angoisses de juge, etc.* (1898); *Une flambée d'amour* (1900); *A même la vie* (1901); *L'Attaque nocturne* (1903). Among his dramas may be mentioned: *Médecin de campagne* (1901); *Attaque nocturne* (1905), with A. de Lorde; *Baraterie* (1906); *Le droit du père* (1907), with J. Monnier. The last years of his life were spent in a study of Racine and he published in 1911 *Autour d'un Racine ignoré*.

MASSO'RA, or **MASSORETH**. See MASORA.

MASSOWAH. See MASSAUH.

MASSYS, **QUINTEN**. See MATSYS, **QUINTEN**.

MAST (AS. *mast*, OHG. *mast*, Ger. *Mast*; probably connected ultimately with Lat. *malus*, pole). In sailing vessels a mast is an upright spar on which sail is set. In large ships masts are in several lengths. In fore-and-aft-rigged vessels the mast is commonly in two parts, called the lower mast and the topmast; in large square-rigged vessels the masts are in three sections, the lower mast, topmast, and topgallant mast. That part of the topgallant mast above the eyes of the topgallant rigging and below the royal rigging is called the royal mast; if skysails are carried the part of the topgallant mast above the eyes of the royal rigging is called the skysail mast or skysail pole.

Large lower masts are either of iron or steel or built up of many timbers whose edges meet in radial planes. These timbers are bolted together and further held by circular bands of iron or steel. They are joined to the timbers above and below by scarfs and the scarfs break joints (i.e., no two scarfs are abreast each other horizontally).

The parts of a mast are the head, hounds, body, partners, and heel. The head is the upper part; the hounds are the enlarged parts just below the eyes of the rigging; the body is the part between the hounds and the deck; the partners the portion which passes through a deck; and the heel is the lower end. Lower masts alone have partners (since the upper masts do not pass through decks) and they have tenons at the heel which fit in the mast step on the keelson. They are held in position by wedges at the partners and by the rigging. Of the latter, the shrouds lead from the masthead just above the hounds to each side of the ship, where they spread out fanwise and sustain the mast against thwartship pressure; the stays lead from the masthead forward along the centre line of the ship, furnishing strength in that direction; while the backstays, also descending from the masthead, extend to the sides of the ship abaft the shrouds to resist the forward pull of the sails. Upper masts have similar rigging, but the lower ends are secured differently. The heel passes through a hole in a heavy iron-bound wooden block called a cap, which is secured to the head of the lower mast, and extends downward to the trestletrees, between which it passes and to which it is secured by a heavy piece of wood or iron, called a fid, passing through the mast and trestletrees or simply resting on the latter, the heel extending beyond the fid hole far enough to be held from horizontal movement by a framed hole between the trestletrees. On the head of the uppermost mast there is usually placed a small disk of wood called the truck, which has sheaves or holes for signal halyards.

Upper masts and the lower masts of schooners and of other fore-and-aft-rigged craft are (when the masts of the latter are not of iron) almost invariably of one stick, the sliding of yards and of the hoops of fore-and-aft sails being interfered with if bands are used. When masts are large and made of a single stick they form no inconsiderable item in the equipment of a ship, for they must be straight, free from blemishes, cracks, deep-seated knots, etc. They are usually of pine, spruce, or fir, which woods combine lightness with strength in addition to other desirable qualities.

As regards position in a ship masts are variously named. In two-masted vessels the forward is called the foremast, the after one the mainmast. In three-masted ships the forward one is the foremast, the middle one the mainmast, the after one the mizzen or mizzenmast. When there are four masts, all large, they are called the foremast, forward mainmast, after mainmast, and mizzen; if the after mast is small, they are called the foremast, mainmast, mizzen, and jigger. When the masts exceed four in number there is no fixed rule for naming.

The masts of large modern steamers and men-of-war are used for signal and lookout purposes. They are of many types, especially in men-of-war. The battleships of the United States navy are fitted with tall circular structures built of steel tubing which have the appearance of open-work or cage towers. The broad bases of these "cage" masts obviate the necessity of stays and the numerous elements permit them to withstand the hits of many projectiles without collapsing or falling. In the British navy and some other services tripod masts are fitted. The masts of large war vessels usually carry one or more observation or searchlight platforms, but fighting tops are no longer fitted on masts nor are guns mounted in any way upon them. See SHIP; SHIP, ARMORED; SHIPBUILDING.

MASTABA. An Arabic word of uncertain derivation, meaning a bench, applied by Mariette to Egyptian tombs of a type which prevailed under the Memphite dynasties of the ancient Empire. Many hundreds of these tombs exist in the great necropolis between Abu Roash and Dashur, especially at Gizeh and Saqqara. They are oblong, benchlike structures with flat roofs of stone and walls of sun-dried brick or of stone, having a slight inclination or batter inward. They vary in size from 19 by 25 feet to 84 by 172 feet, and are carefully oriented, with the long axis set north and south. Upon this axis an opening in the roof marks the mouth of the burial shaft, which leads to the mummy chamber, cut in the rock at a depth of some 40 feet. The mastaba itself is sometimes solid, sometimes chambered. The solid mastaba has upon its eastern face a rectangular recess, containing an inscribed stele. In the chambered mastaba a doorway set in a recess, which in the more important examples forms a spacious vestibule or porch fronted by twin piers, gives access to the chamber or chapel. This is often richly adorned with mural paintings, designed for the delectation of the *ka*, or disembodied double of the deceased, and invariably possesses on its western wall an inscribed stele and a sculptured door, through which the *ka* might eventually pass to the land of the Sun of Night. From this chamber also small openings lead to the *serdabs*, or secret chambers containing the *ka* statues, by means of which the *ka* was supposed to retain

his or her identity while confined in the limbo of the tomb. Sometimes these openings are wanting, the *serdabs* being hermetically sealed. The chapel was open to any one to enter. Consult: Perrot and Chipiez, *Histoire de l'art dans l'antiquité*, vol. i (Paris, 1882); A. E. Mariette, *Les mastabas de l'ancien empire* (ib., 1881-87); Adolf Erman, *Life in Ancient Egypt* (New York, 1894); Georges. Bénédict, "Les origines du mastaba," in *Musée Guimet, Annales*, vol. xxx (Paris, 1908). An excellent model of a mastaba, showing internal arrangements, is illustrated in the *Bulletin of the Metropolitan Museum of Art*, vol. viii (New York, 1913).

MASTER (OF. *maître*, Fr. *maître*, from Lat. *magister*, leader; connected with *magnus*, Gk. *μέγας*, *megas*, great). The proper designation of the commander of a merchant vessel. The courtesy title of captain which is generally accorded him is a military designation properly belonging to the naval service only. The rank of master existed in the United States navy and was the title of an officer next junior to lieutenant. It was the survival of the term "sailing master," which in turn was a relic of the days when ships were commanded and fought by soldiers but navigated and maneuvered by the sailing master and his crew of seamen. The Act of Congress of August, 1882, changed the title of master to that of lieutenant (junior grade).

MASTER AND SERVANT. In its broadest sense, persons in such a relation that one is employed to work for and represent the other. Modern law, however, distinguishes the employee who is engaged to represent his employer in business transactions involving the making of contracts on the employer's behalf from others, and designates him as agent (q.v.). This article will be confined to the law of master and servant in its narrower sense—to the rules governing the relation of persons where one is employed to render service for the other but not to bind him by contract.

Formerly servants were classified as voluntary and involuntary, the latter including slaves and apprentices (see APPRENTICE). As slavery, or involuntary servitude, has, except as a punishment for crime, disappeared from every common-law jurisdiction, and as apprenticeship has largely lost its importance, only voluntary servants will be here considered. Eminent legal writers hold that some of the rules governing master and servant to-day "can only be explained by going back to the time when servants were slaves." For example, it is said the genesis of the master's extraordinary liability for acts of his servant which he has neither commanded nor approved is found in the right of the ancient master to surrender the slave who has injured another. This and similar views, however, have not been sufficiently established.

The modern servant becomes such as the result of an agreement with the master which either party may break at will, subject only to the usual consequence that the party in the wrong is liable to pay damages for the breach of contract. If the contract is not to be performed within a year after it is made, it is required by the Statute of Frauds (q.v.) to be in writing. If, however, it be for an indefinite period, which may end within a year after the agreement is entered into, no writing is necessary. Thus, a contract of service, to continue indefinitely during the life of either party thereto, may be made

orally, since it may terminate within a year after it is made. And even when an oral agreement is made for a term longer than a year, if the master receive and accept services rendered by the servant and then refuse to go on and complete the contract, the latter may recover, in an action in quasi contract, technically called a *quantum meruit*, the value of the labor he has thus performed. When the services continue for a year, and after its expiration the servant remains in the same employment without any further expressed agreement, a renewal of the contract for another year and upon the same terms is presumed. In the absence of special contract as to the time of service it is sometimes difficult to determine whether the hiring is for a year or for a shorter period, such as a month, week, etc. The common instance of the hiring of farm hands, in which each of the interested parties had a right, in the absence of any contract stipulations, to assume that the services would continue through the four seasons, gave rise to the presumption, which came to be applied to most contracts of hiring in England, that if no time were specified an agreement was meant to last for one year. But this presumption is easily overcome by slight evidence of facts and circumstances which indicate a contrary intention. Thus, the period for which the wages are to be paid, as by the quarter, month, week, etc., will frequently be decisive in proving the hiring to be for a year, a month, a week, etc., as the case may be. And it may be laid down as the general rule in the United States that where the contract is silent as to the term of service and there is no well-defined usage in the particular community on the subject, the hiring is terminable at the will of either party.

After the relation has been duly constituted we have to consider (1) the mutual duties and liabilities of the parties and (2) their respective rights and liabilities with respect to third parties.

1. Mutual Duties and Liabilities. The servant is bound to have competent skill for the service which he undertakes, to exercise due diligence in his work, to obey all lawful orders of his master concerning the labor for which he was engaged, to conduct himself respectfully, and not to leave his employment during the time for which the contract was made. If he leave the master without just cause during the stipulated time, he cannot recover unpaid wages for the services already rendered, and if he be rightfully discharged he forfeits his wages for the period during which he has served without payment. But if he be prevented by sickness from completing his part of the contract, he may recover for the value of the services which he has rendered. If his unjustifiable breach of contract result in damage to his employer he is liable therefor. In some cases servants may be enjoined by the courts from breaking their contracts of service. (See CONSPIRACY; STRIKE.) Some of the grounds on which a servant may be lawfully discharged before the expiration of his term are gross immorality, willful disobedience of orders, habitual negligence, and glaring incompetence to perform his duties. If during his term he be discharged unjustly and without sufficient cause, he may either treat the contract as rescinded and sue for the value of the services already rendered, or he may sue for the breach of the contract and in that action recover both the value of the services already rendered and

the compensation for the damages sustained by him because of his wrongful discharge. But it is always his duty, during the residue of the term for which he was employed, to seek for other employment of a similar character in the same locality, in order to reduce as much as possible the damages recoverable against his master. If he do not thus seek and accept such similar employment as he may be able to obtain, the master may show that fact, in mitigation of damages, in the action brought by the servant for the breach of the contract. If, after the contract is made, the master neglect or refuse to furnish work pursuant thereto, the servant may recover as damages the entire amount of the stipulated wages, if he have duly held himself in readiness to perform and been unable by reasonable effort to obtain other employment of a similar character. If he sue, however, before the expiration of the stipulated time and recover damages up to the time of trial, he will be thereby barred or precluded from maintaining any further action for subsequently accruing damages. This results from the principle that a contract for work and services is entire, and its breach gives only one right of action. When a servant becomes sick the master is generally under no obligation to supply him with medical attendance; but an implied contract to pay for the services of a physician who is called in is frequently fastened upon the master from the fact that he has the physician called and otherwise acts as if he were assuming the obligation.

While, as a rule, the servant takes upon himself all the ordinary risks incident to the employment, still the master is under a legal obligation to use reasonable and ordinary care to supply the servant with safe machinery and appliances with which to work; and if, because of the master's failure to perform the duty properly, the servant be injured, without any contributory negligence on his own part, he may recover, in an action against his master, compensation for the damages thus sustained. If the servant be employed upon work involving special risks, of which he cannot be presumed to be cognizant, it is the duty of the master to inform him of such risks, or the master will be chargeable with negligence. Where the labor is in connection with specially dangerous machinery—such, e.g., as that used by railroad companies—the courts require the master to have the same very carefully inspected, to see, as far as is reasonably possible, that it is safe; but even in such cases they do not go to the extent of making the master an insurer of the servant's safety in the use of such machinery. If a servant be aware of the dangerous character of the place in which, or machinery or tools with which, he is requested by the master to work, and continue in his employment without objection on that ground, he cannot recover damages from the master for an injury which results from any such cause. If the master willfully injure the servant, or by his personal neglect or wrongful act cause him injury in other ways than through defective machinery, place of labor, or implements of toil, he is liable to such servant in damages. In entering upon his employment the servant also voluntarily takes the risk of injury which may result from the negligence or wrongful acts of his fellow servants (q.v.), except in cases coming within the provisions of modern statutes relating to employers' liability (q.v.).

Although it is customary for the master to give a testimonial of character to an honest and capable servant at the termination of his employment, he is not legally bound to do this, in the absence of a contract or a well-defined usage therefor.

2. Their Rights and Liabilities with Respect to Third Parties. The master is entitled to the services of his servant in accordance with the contract of hiring. He may, therefore, justify an assault necessarily made in defense of his servant and may have an action for damages against any one who wrongfully beats or injures the servant so that his services are lost or impaired. So if any one entice away the servant and thereby cause loss to the master, the latter may recover in an action the damages for the injury thus sustained. If a female servant be seduced, her master may sue for consequent loss of services.

For his acts of negligence or positive wrong which result in injury to others a servant is, of course, personally liable. But since he is so often peculiarly irresponsible, the question most frequently litigated is that of the extent of his master's liability for such acts. The general statement of the rule is that the master is liable for the wrongful acts or torts of his servant which are within the scope of his employment and which cause injury to third persons. Even though the act of the servant be a willful wrong, yet when it is done in connection with the master's business or in furtherance thereof, it may make the latter liable for injury thereby occasioned to third parties. But when the servant leaves and loses sight of his master's business, and wantonly does a wrongful act, he alone is liable for consequent injury to others. When a servant creates a nuisance upon his master's premises, whereby injury is caused to adjoining property, and when a servant prevents his master from performing a contract by which the latter is bound, the master is liable, even though the act of the servant were willful and malicious. So a carrier of passengers is bound to protect them from injury resulting from the violence or insults of his own servants, and will be liable if while passengers they be thus injured.

For important statutory changes in the law of master and servant, see COMBINATION; CONSPIRACY; EMPLOYERS' LIABILITY; FELLOW SERVANTS; LABOR LEGISLATION; STRIKES. Other statutes have for their objects the prevention of the employment of young children in certain lines of work; securing the payment of wages in money and at stated times; limiting the hours of labor which masters may require of their servants; and the like.

MASTER-AT-ARMS. A petty officer in the navy who forms one of the police of a ship. In the United States navy there are four grades of masters-at-arms—chief master-at-arms and masters-at-arms of the first, second, and third class. Large ships have one or more chief masters-at-arms and several of the lower ratings. In small ships a first or second class master-at-arms is the chief of the ship's police.

MASTER BUILDER, THE. A drama by Ibsen (1893). The original title is *Master-BUILDER Solness*.

MASTER HUMPHREY'S CLOCK. Tales by Charles Dickens which appeared in a weekly of this name. "Old Curiosity Shop" and "Barnaby Rudge," purporting to have been narrated by Master Humphrey, were the stories. They were subsequently published separately.

MASTER IN CHANCERY. An officer of a chancery or equity court, appointed to assist the chancellor or judge. The office is one of great antiquity. Formerly the masters were assistants or associates of the chancellor and the Master of the Rolls and sat with them in court by turns, usually two at a time. In later times, however, this practice was discontinued and the duties of masters confined to business transacted in chambers, some of their duties being purely ministerial and administrative and some of a judicial character. It was common practice to refer causes to a master for hearing, particularly causes involving intricate accounts and requiring computation. A master is often appointed to examine witnesses, to take depositions, to inquire into and report the facts of a case to a chancellor or judge of the court, to make settlements under deeds, to discharge special duties under the direction and in behalf of the court, etc. Masters in chancery were formerly clerks in chancery, 11 in number, besides the Master of the Rolls, who was their chief. They were at first called *preceptores*, but in the reign of Edward III came to be known as masters in ordinary. The office has been abolished in England, the duties formerly belonging to masters being now discharged by judges or registrars and by masters of the Supreme Court. In most of the United States the office still exists, the officer being sometimes called a master and sometimes commissioner (q.v.). See MASTER OF THE ROLLS; MASTERS OF THE SUPREME COURT; REFEREE.

MASTERMAN, ARTHUR THOMAS (1869–). An English zoölogist, born at Tunbridge Wells, a brother of C. F. G. and J. H. B. Masterman. He was educated at Weymouth and at Christ's College, Cambridge. At St. Andrews he was assistant professor of natural history in 1893–99 and at Edinburgh lecturer on biology and zoölogy at the School of Medicine in 1900–03. In 1903 he became superintendent inspector to the Board of Agriculture and Fisheries, and from 1905 to 1912 he was British Government expert to the International Council for the Study of the Sea. With W. C. McIntosh, of St. Andrews, he wrote the valuable *Life-Histories of the British Marine Food-Fishes* (1897), and alone he made many contributions to technical periodicals and published an *Elementary Text-Book of Zoölogy* (1901–02).

MASTERMAN, CHARLES FREDERICK GURNEY (1873–). An English publicist and author, born in Sussex, a brother of A. T. and J. H. B. Masterman. He distinguished himself as a student at Christ's College, Cambridge, of which

he became a fellow in 1900. After leaving the university he became known as a contributor to the London weeklies and magazines and as literary editor of the *Daily News*. He was connected with London poor-work administration and acted as lecturer for the Cambridge and London University Extension societies. As a Liberal, he sat in Parliament for West Ham from 1906 to 1911 and for South-West Bethnal Green thereafter till 1914. In 1909–12 he was Undersecretary of State, Home Department, and in 1912–14 Financial Secretary to the Treasury. In 1914 he was appointed Chancellor of the Duchy of Lancaster, but resigned the next January. He wrote: *Tennyson as a Religious Leader* (1899); *The Heart of the Empire* (1901); *From the Abyss* (1902); *In Peril of Change* (1905); *The Condition of England* (1909); *Modern Industrialism* (1912).

MASTERMAN, JOHN HOWARD BERTEAM (1867–). An English clergyman and historian, brother of A. T. and C. F. G. Masterman. He was educated at Weymouth College, at University College School, and at St. John's College, Cambridge, where he was lecturer and Naden divinity student in 1894–96. He was for three years a university-extension lecturer and vicar of St. Aubyn's, Devonport. Then for 10 years he was in Birmingham, being principal of the Midland Clergy College (1899–1901), warden of Queen's College (1902–07), canon of Birmingham (1906–07), and professor of history in the university (1902–09). He was afterward canon of Coventry and rector of St. Mary-le-Bow Church, Cheapside. Masterman served as Hulsean lecturer at Cambridge in 1907–08. He published: *The Age of Milton* (1897), *Introduction and Notes to the First Epistle of St. Peter* (1900), *Was Jesus Christ Divine?* (1904), *I Believe in the Holy Ghost* (1906), *Rights and Responsibilities of National Churches* (1908), *The House of Commons* (1908), *Parliament and the People* (1909), *The Dawn of Medieval Europe* (1909), *History of the British Constitution* (1912), *The Challenge of Christ* (1913).

MASTER OF ARTS. A degree conferred by colleges and universities. In those of the United States and Great Britain this title follows that of Bachelor of Arts. In the United States a corresponding master's degree follows a bachelor's degree in science, philosophy, or other baccalaureate designations and indicates a year's study beyond the baccalaureate course. The master's degree is the highest in the faculty of arts, but inferior to that of bachelor of divinity and the doctorate of philosophy. In the early universities the mastership or licentiate, as it was then called, was the one degree conferred, the baccalaureate then being a mere preliminary degree, and the doctorate being either a synonymous term or one used to indicate the ceremonial and official aspect of the licentiate. It is still the first degree conferred in the Scottish universities. In the universities of Germany the terms "mastership" and "doctorate" are yet sometimes used as synonymous. In the British universities the degree of Master of Arts is the highest degree taken by the majority of students, although the doctor's degree whether by research or examination is becoming more common, especially in the newer universities. At Oxford and Cambridge the M.A. degree is open without examination to those who hold the B.A. after a period of years on paying the necessary fees. The chief value of the degree at these univer-

sities, except that it indicates a certain standing, is that it is accompanied by the privilege of voting in Congregation at Oxford and the Senate at Cambridge, a privilege which on more than one occasion has led to the defeat of progressive measures by the large body of masters of art who are nonresident and often out of touch with the actual educational needs of the universities and the country. See BACHELOR'S DEGREE; DEGREE; UNIVERSITY.

MASTER OF THE BUCKHOUNDS. In Great Britain, an officer in the Master of the Horse's department of the royal household, who, with the hereditary lord falconer, has the control of all matters relating to the royal hunts. A salary of £1500 is attached to the office, which is regarded as one of considerable political importance. The Master of the Buckhounds goes out of office on a change of ministry.

MASTER OF THE HORSE. In Great Britain, an officer of the court who has the superintendence of the royal stables and of all horses and breeds of horses belonging to the sovereign. He has the privilege of making use of the royal horses, pages, and servants, and rides next to the sovereign on all state occasions. The Master of the Horse is appointed during pleasure, by letters patent; but his tenure of office depends on the existence of the political party in power. The office was an important post under the Byzantine emperors, where the count of the royal stables, the *comes stabuli*, or constable, exercised far greater powers than are conveyed by the mere title. In ancient Rome, when, in times of crisis, recourse was had to the creation of a dictator, the latter appointed a master of the horse as his chief lieutenant, corresponding to the modern chief of staff.

MASTER OF THE HOUSEHOLD. In Great Britain, an officer in the Lord Steward's department of the royal household, whose specific duties consist in superintending the selection, qualification, and conduct of the household servants. He is under the treasurer and with the comptroller examines the accounts of the department. The appointment is during pleasure of the sovereign and is not dependent upon any political party.

MASTER OF THE REVELS. An official of the English court (*Magister jocorum revelorum et maseorum*) who had charge of the royal festivities. The office came into prominence in the reign of Edward VI, though established at an earlier date.

MASTER OF THE ROLLS. The president of the chancery division of the High Court of Justice in England and in rank next to the Lord Chief Justice of England and the Lord Chancellor. He is the keeper of the rolls of all patents and grants that pass under the Great Seal and of all records of the Court of Chancery. He was originally an officer of that court and was formerly the chief of the masters in chancery. He is the only superior judge in England who can now be elected to represent a constituency in the House of Commons. The Master of the Rolls had originally the custody of the rolls or records; in the course of time this charge became merely nominal, the custody having vested in officers not in his appointment or control, an anomaly which was remedied by 1 and 2 Vict., c. 94, which restored the custody to him with extensive powers. Consult Hardwicke, *Office of the Master of the Rolls* (London, 1728); D. M. Kerly, *Historical Sketch of the Equitable*

Jurisdiction of the Court of Chancery (Cambridge, 1890); Pollack and Maitland, *History of English Law* (2d ed., ib., 1903).

MASTER OF THE SACRED PALACE.

See MAGISTER SACRI PALATII.

MASTER OF THE SUPREME COURT.

The title given in England to the chief officers of the courts under the judges, their duty being to attend the sittings of the courts during term and make minutes of their proceedings. They also tax all the bills of costs of the parties arising out of the suits and matters before the courts and exercise many judicial as well as most of the administrative functions of the courts to which they are attached. Their duties are determined by rules of the Supreme Court. The power of appointing the masters is vested in the Lord Chancellor, the Lord Chief Justice of England, and the Master of the Rolls. There are 18 masters attached to the King's Bench Division of the Supreme Court and 16 to the Chancery Division. In the courts of the United States the duties of masters are divided between the judges and the clerks of the courts. Consult Renton and Robertson (eds.), *Encyclopedia of the Laws of England* (2d ed., London, 1908). See MASTER IN CHANCERY; MASTER OF THE ROLLS.

MAS'TERS, MAXWELL TYLDEN (1833-1907).

An English botanist, born at Canterbury, England. He was educated at King's College, London, and from 1855 to 1868 was lecturer on botany at St. George's Hospital. In 1865 he became the principal editor of the *Gardener's Chronicle*. Among his general publications are: *Vegetable Teratology* (1869; in German, 1886); *Botany for Beginners* (1872); *Plant Life* (1883); *Plant Life on the Farm* (1905). *Botany for Beginners* and *Plant Life* were translated into French, German, and Russian. The Conifers were the special subject of his investigations, and many papers dealing with them appeared in various scientific serials.

MAS'TERS, THE SEVEN WISE. See SEVEN WISE MASTERS.

MASTERSINGERS.

See MEISTERSINGER.

MASTERWORT (trans. of Neo-Lat. *Imperatoria*, fem. sing. of Lat. *imperatorius*, imperial), *Imperatoria ostruthium*. A perennial plant of the family Umbelliferae, from 1 foot to 2 feet high, with broad biternate leaves, large flat umbels of whitish flowers, and flat, orbicular, broadly margined fruit. It is a native of the north of Europe and has been introduced in a few localities in America. It was formerly much cultivated as a potherb and was held in great repute as a stomachic, sudorific, diuretic, etc.; its virtues being reckoned so many and great that it was called *divinum remedium*. It still retains a place in the medical practice of some countries of Europe, although probably it is nothing more than an aromatic stimulant. The root has a pungent taste, causes a flow of saliva and a sensation of warmth in the mouth, and is said to afford relief from toothache. Some recent monographers have separated this and its related species from *Peucedanum*, grouping them in the genus *Imperatoria*.

MAS'TIC (Fr. *mastic*, from Lat. *mastiche*, from Gk. *μαστίχη*, *mastichē*, mastic, from *μασρίζω*, *mastizein*, to chew; so called because used as chewing gum in the East). A species of gum resin yielded by the mastic or lentisk tree (*Pistacia lentiscus*, *Pistacia atlantica*) and other species of the family Anacardiaceæ. It

oozes from cuts made in the bark and hardens on the stem in small, round, tearlike, straw-colored lumps, or, if not collected in time, it falls to the ground; in the latter state it acquires some impurities and is consequently less valuable. Its chief use is in making the almost colorless varnish for varnishing prints, maps, drawings, etc. It is also used by dentists for stopping hollow teeth and was formerly employed in medicine as a mild stimulant. Small quantities are exported chiefly from the Morocco coast, but some is occasionally shipped from the south of Europe. The name mastic is also given to oleaginous cements, composed of about seven parts of litharge and 93 of burned clay, reduced to fine powder, made into a paste with linseed oil. See **SIDEROXYLON**.

MASTIFF (OF. *mestif*, Fr. *métif*, of mixed breed, mongrel, from Lat. *miatus*, p.p. of *miscere*, Gk. *μιγνεν*, *misgein*, *μυγνύει*, *mignynai*, to mix, Skt. *mīṣra*, mixed, OChurch Slav. *mēsiti*, Welsh *mysgu*, Gael. *measy*, OHG. *miskan*, Ger. *mischen*, AS. *miscian*, Eng. *mix*). A large dog of the hound group, kept since ancient times to guard property, and more recently as a pet. See **HOUND**.

MASTIFF BAT. One of a group of tropical American bats (genus *Molossus*), characterized by mastiff-like faces, general muscularity, and long, thick tails free from the membrane. They are better able than most other bats to scramble about on their feet. They assemble in large companies in hollow trees, caverns, and old houses, and sometimes constitute a nuisance by taking possession of roofs and garrets. One species (*Molossus perotis*) measures 2 feet across the outstretched wings. Consult P. H. Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851), and H. W. Bates, *The Naturalist on the River Amazons* (ib., 1910).

MAS'TIGOPH'ORA (Neo-Lat. nom. pl., from Gk. *μαστιγοφόρος*, *mastigophoros*, whip-bearing, from *μάστιξ*, *mastix*, whip + *φέρειν*, *pherein*, to bear). A class of Protozoa characterized by the presence of one or more flagella, or lashlike appendages. Some (*Euglena*) approach the plants and were formerly placed with them; others

(pullæ) of sponges. These forms are fixed or stalked, and tend to grow in colonies, so as to suggest the derivation of the sponges from some such forms. They have but a single flagellum, but no trace of a mouth or gullet. They multiply by longitudinal fission, or produce numerous young (flagellulæ).

The third order, Dinoflagellata, move by means of two flagella, and are remarkable for having the body often protected by a very beautiful and elaborate shell formed of cellulose in plates, which is provided with three long processes or horns. They are mostly marine. Some are phosphorescent, while certain species occasionally abound in such enormous numbers as to color the sea water deep brown or red. See **RED WATER**.

Of the Cystoflagellata, which have two flagella, one is modified into a large long tentacle, the other minute and situated within the gullet. *Noctiluca* (q.v.) is the type.

MASTITIS. See **MAMMARY GLAND, DISEASES OF; MAMMITIS**.

MASTODON (Neo-Lat., from Gk. *μαστός*, *mastos*, breast + *ὀδούς*, *odous*, tooth). The name for a genus of extinct elephants. This genus is that most remote from the family type (*Elephas*) and nearest the *Dinotherium* type, by reason mainly of the structure of its molar teeth, which are provided with but few transverse ridges—not more than five—that have a Λ form in cross section (occasionally broken into isolated conical tubercles) and are separated by little or no cement. (See **MAMMOTH**.) Another dental difference of the Tertiary mastodons from nearly all other Elephantidae is its possession of milk molars, which in some instances persist through life, the permanent dentition in such cases being a mixture of milk and permanent teeth. Tusks (incisors) sometimes occur in both jaws.

Mastodons began to exist in the Miocene age and became extinct in the Pleistocene. They were scattered all over the globe, and more than 30 species have been distinguished by paleontologists, the latest described (1901) being a small and primitive type discovered in Egypt. This seems to confirm the prevailing opinion that the group originated in the Old World and spread to America by way of Siberia. Two or more species belong to South America (Patagonia), where no other elephant has thus far been found. It is probable that several species lived in North America, but the one best known and commonly in mind when the term is used is *Mastodon americanus*. This species seems to have ranged over all the United States and southern Canada and to have been numerous, for its teeth and bones, in a more or less perfect condition, are repeatedly found. A dozen or more mounted skeletons are on exhibition in

TEETH OF ELEPHANTS.

Comparison of tooth structure of proboscideans, shown by vertical cross sections of molars; a, mastodon; b, *Elephas insignis*, a fossil species intermediate between mastodons and true elephants; c, African elephant; d, mammoth. This series exhibits progress from simplicity to complexity.

closely resemble Rhizopoda. The group is divided into four orders: (1) Flagellata (q.v.); (2) Choanoflagellata; (3) Dinoflagellata; (4) Cystoflagellata. See **NOCTILUCA**.

The Choanoflagellata, or collared monads, are mostly fixed and remarkable for their collar, a vaselike prolongation of the protoplasm of the body. In this respect they resemble the collared digestive cells lining the digestive sacs (am-

CHOANOFAGELLATA MASTIGOPHORA.

1, Monosiga; 2, Salpingoeca; 3, Polyeca; 4, Proterospongia; 2b illustrates longitudinal fission; 2c, the production of germs (flagellulæ); c, collar; c.vac, contractile vacuole; fl, flagellum; l, lorica; nu, nucleus. (After Kent.)

museums in New York, Chicago, Pittsburgh, Cambridge, Mass., Albany, N. Y., and elsewhere. Careful comparison and study of these and other specimens show that this mastodon at least must have had the general form and appearance of a modern elephant, with a somewhat heavier body and flatter forehead than that of the mammoth or Indian elephant; nor did its height exceed theirs on the average—if anything it was less, owing chiefly to the shortness of the legs. The tusks, too, were of similar length (9 feet, measured along the outer curve, indicating an old and large male), and they had a characteristic tendency to curl upward, in much the same way as in living elephants. It is probable that the animal, at any rate in the more northerly parts of its range, was warmly clothed, like the mammoth, although there is not much direct evidence of it beyond the discovery, many years ago, of a large mass of woolly brown hair buried in a bog in Ulster Co., N. Y., in apparent connection with mastodon remains. Several of the most complete skeletons known have been obtained from that region, where animals had become mired in swampy valleys. The disappearance of this numerous and widespread species is as incomprehensible as in the case of the mammoth and the South American horse. That it existed until recent conditions were established is plain. The food remains in its stomach have been repeatedly analyzed and found to consist of herbage, bark, and leaves especially of conifers of the same kinds as now grow in the place where its bones lay. Workmen who came upon and broke mastodon bones in an Illinois peat bog (see *American Naturalist*, January, 1882) greased their boots with the marrow fat. It is the opinion of competent judges that remnants of the herds survived the advent of mankind into North America; there being many positive statements on record as to arrowheads lying among mastodon bones. On the whole, American geologists think it highly probable that the mastodon and man were briefly contemporary in North America and that it was the ancestors of the Indians who exterminated this unwieldy animal.

Consult: J. C. Warren, *The Mastodon Giganteus of North America* (Boston, 1855); F. A. Lucas, "Animals of the Past," in *American Museum of Natural History, Handbook Series No. 4* (New York, 1913); W. B. Scott, *A History of Land Mammals of the Western Hemisphere* (ib., 1913).

MAS'TODONSAURUS (Neo-Lat., from *mastodon*, mastodon + Gk. *σαῦρος*, *sauros*, lizard). The largest known labyrinthodont batrachian, found fossil in Triassic rocks of Württemberg, England, and India. The body attained a length of nearly 10 feet and the skull alone had a length of about 4 feet. See *STEGOCEPHALIA*.

MASTOIDI'TIS. See *EAR*.

MASUDI, mā-sū'dê (Ar. ABU'L HASAN 'ALĪ AL MAS'ŪDĪ) (?-c.956). One of the most eminent Arabian geographers and historians. He was born in Bagdad, descended from a distinguished family, one of whose members, Mas'ud, was a companion of Mohammed on his flight to Medina. Masudi early devoted himself to profound studies; he also undertook extensive journeys into many lands even beyond the bounds of Islam. After traveling through Persia and Kirman he came in 916 to India, where he visited Multan and Mansura; thence he went to Ceylon and subsequently proceeded east as far as China. On his way back he spent some time in Mada-

gascar and Oman. To the north he went to the Caspian district, and in 926 we find him at Tiberias in Palestine. In 943 he was at Antioch and two years later in Damascus. The rest of his life he spent in Syria and Egypt, dying at Fostat about 956. He was a geographer, philosopher, student of religions, familiar with Judaism and Christianity, and a historian acquainted with the ancient and modern history of the East and West. His *Kitāb Akhbār al-Zamān* contained a universal history in 30 volumes; his *Kitāb al-Ausat*, a short chronological account of the world's history. Masudi combined these two in a more popular work called *Murāj al-Dhahab* (Meadows of Gold), in which he gives a general view of the political, religious, and social history of the most important Asiatic and European countries, as well as of their geography (ed. Bulak, 1866, Cairo, 1886; with French trans. by De Meynard and De Courteille, 9 vols., Paris, 1861-77; vol. i in English by A. Sprenger, London, 1841). A still more general work on history and geography was his *Kitāb al-Tanbih* (ed. De Goeje, Leyden, 1894; partially trans. by De Sacy in *Notices et extraits*, vol. viii, and in vol. ix of the French trans. of the *Meadows*). Another work, also called *Akhbār al-Zamān*, is falsely ascribed to him. Consult: Carra de Vaux, *L'Abregé des merveilles* (Paris, 1898); Karl Brockelmann, *Geschichte der arabischen Literatur*, vol. i (Weimar, 1899); R. A. Nicholson, *A Literary History of the Arabs* (Cambridge, 1907).

MASULIPATAM, mā-sū'lê-pā-tām'. The capital of the District of Kistna, Madras, British India, 215 miles north of the city of Madras, on the Bay of Bengal on one of the mouths of the Kistna (Map: India, D 6). Its former brisk export trade in cotton manufactures is in a state of decline and at present the city is of little industrial importance. There are still small industries in weaving, bleaching, and printing. Masulipatam was visited by a very severe storm in 1864, during which it is estimated that nearly 30,000 persons were killed. Its chief institution is Noble College. Pop., 1901, 39,507; 1911, 42,123.

MASURENLAND, mā-zoo'ren-länt. The name of the section of East Prussia which includes in the broadest sense the circles of Johannisburg, Sensburg, Lyck, Lötzen, Ortelsburg, Neidenburg, Rössel, Oletzka, Osterode, and Allenstein. The land is one of gently rolling topography, marked by hundreds of lakes, some of them basins with many branches, and some long narrow channels with several pieces of water following one another like beads on a string. The most important of these lakes, Mauer and Spirding, cover an area of more than 40 square miles. The whole region is connected by a canal system over 100 miles in length. Lyck is commonly called the capital of the entire district. Some years ago the German government thought of draining part of this region as Frederick the Great had done in the middle of the eighteenth century. The military authorities strongly objected, contending that this section would always be a barrier to a Russian invasion. The wisdom of following the latter course was well illustrated in the European War which began in 1914. On several occasions in the winter of 1914-15 the Russians made inroads into Masurenland. With the coming of spring and the melting of the ice they were compelled to retreat so as not to have their

lines of communication effectively cut. See WAR IN EUROPE.

MAT. See MATTING.

MA'T (Egypt. *Ma'et*, truth). An Egyptian deity, the goddess of truth and justice. She is usually represented as a woman wearing upon her head an ostrich feather, and occasionally her eyes are bandaged to indicate that she judges without respect to persons. She is always present at the judgment of the dead (q.v.), and it is her symbol, the feather, against which the heart of the deceased is weighed. At all periods the kings of Egypt professed themselves zealous worshippers of the goddess; judges especially were her priests and wore her image when on the bench. Ma't was the daughter of the sun god Rê; by the Greeks she was identified with Themis. Consult Alfred Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897), and A. E. T. W. Budge, *The Gods of the Egyptians*, vol. i (London, 1904). See PLATE of EGYPTIAN DEITIES.

MATABELELAND, măt'a-bē'lē-land. One of the two divisions, or provinces, of Southern Rhodesia, lying east of the Bechuanaland Protectorate and separated from the Transvaal by the Limpopo River (Map: Africa, G 6). In 1888 the Matabele came within the British sphere of influence by a treaty signed by their chief, Lobengula. The following year they were brought under the administration of the British South Africa Company, against which they declared war in 1893. They were subdued after a spirited campaign, during which Lobengula died. In 1896-97 there was another revolt, after which the natives were allowed a share in the government, the country being divided into districts, each with a native commissioner, responsible for the good conduct of his people. The white population in 1911 numbered 10,975; native population, 249,108; in addition there were a number of Asiatics and other colored persons. The chief towns are Bulawayo, Gwelo, and Selukwe. Bulawayo had 5200 white inhabitants in 1911; it is on the main line of the "Cape to Cairo" Railway, 1362 miles from Cape Town, and is connected by rail with Salisbury, in Mashonaland, and with the Gwanda mines. See RHODESIA.

The Matabele, or Matabili, are a Zulu people of Bantu stock driven out of the Transvaal by the Boers into South Zambezia, thenceforth known as Matabeleland. The celebrated chief Umsilikatzi in 1838 led the exodus and after crossing the Limpopo established his seat of government at Bulawayo. His successor (1870) was the chief Lobengula. The Zulu military organization copied from Europeans enabled the Matabele, previous to British domination, to harass and almost destroy the surrounding Mashonas and other peoples and rendered much of the territory beyond the Limpopo a wilderness.

The Matabele are herdsmen and to their cattle they attach the highest importance, but they also raise great crops of maize, tobacco, and other agricultural products. Their houses are thatched, circular in plan, and have conical roofs. The villages have no particular arrangement. The women brew beer and grind maize as their principal duties. The men are brave hunters and are accustomed to attack the lion with their assegais. They smelt iron and work it into spears, battle-axes, hoes, etc. Rude pottery is made, and cloth from bark. They are polygamists. Ancestor worship is the most

prominent feature of their religion. Consult: Frank Oates, *Matabele Land and the Victoria Falls* (London, 1881); Montague, *The Interior of Central Africa* (ib., 1886); Wills and Collingridge, *The Downfall of Lobengula* (ib., 1894); Norris *Matabeleland* (ib., 1895); R. S. S. Baden-Powell, *The Matabele Campaign* (2d ed., ib., 1901).

MATACHINES, măt'a-chē'nās (from Sp. *matachin*, clown performer, masked dancer). A kind of dramatic dance given at Christmas time by the Spanish-speaking natives of New Mexico, that is usually said to relate to Montezuma, the last ruler of the Aztecs. The performers wear masks and headdresses and carry gourd rattles and three-tined wands, called "palms." The principal characters are El Monarca, "the monarch," i.e., Montezuma; La Malinche, a young and very pretty girl, who plays the leading female rôle (in reality the name Malinche is simply the Aztec pronunciation of Marina, the famous mistress of Cortés); El Toro, "the bull," a clown who wears a buffalo head and robe; and El Abuelo, "the grandfather," an old man who carries a whip and impersonates the Devil. The dance is partly processional and partly stationary, with El Monarca either at the head of the procession or seated on a throne. La Malinche does a *pas seul* between the two lines of dancers, and according to one story succeeds by her gracefulness and beauty in relieving Montezuma from his melancholy and in making him return to his people, whom he had forsaken. Another explanation of the drama is that it represents an incident in the life of Cortés instead of Montezuma, and that La Malinche, Cortés's mistress, dances down between the lines of conspirators, learns their secret, and warns Cortés. There is undoubtedly an Indian element in the dance, and it belongs to a class of Indian-Spanish dramas, usually called *historias*, that are seen in many parts of Mexico and Central America.

MATACO, măt-ă'kō. A group of tribes constituting a distinct stock, ranging along the Vermejo River in the Chaco region of northern Argentina. They are pastoral hunters, subsisting entirely by hunting and fishing and the product of their horses and cattle. They fish with nets and arrows. They dress in skins and live in small brush huts, but are apt in the use of tools. They are rather under medium size, with hair frequently wavy. They are sometimes called Mataguayos, a name properly belonging to another tribe of Guaycuran stock living somewhat farther to the north. Consult: Lafone Quevedo, in *Instituto Geográfico Argentina, Boletín* (Buenos Aires, 1896-97); D. G. Brinton, *Linguistic Cartography of the Chaco Region* (Philadelphia, 1898); *Anales de la Sociedad Científica Argentina* (Buenos Aires, 1904); Schuller, *Sobre el origen de los charrúas* (Santiago, 1906).

MAT'ADOR, Sp. pron. măt'tă-dōr'. See BULL-FIGHT.

MATAGALPA, măt'tă-găl'pă. A town of Nicaragua, capital of the Department of Matagalpa (Map: Central America, E 4). It is situated on a plateau in the north-central part of the country and has a very pleasant climate. It is the centre of a rich agricultural district producing sugar, tobacco, and coffee. Stock raising, also, is carried on extensively. It is the seat of a United States consular agent. Pop. (est.), 15,749, largely native Indians.

MATAGUAYO, mā'tā-gwā'yō. An Indian stock of South America. See GUAIACUBUAN; MATACO.

MATAJA, mā-tā'yā, VICTOR (1857-). An Austrian political economist, born in Vienna. He studied at the university of his native city, where he lectured from 1884 to 1890 on political economy. From 1890 to 1892 he was professor of law at the University of Innsbruck, and in the latter year he became councilor in the ministry and head of the Department of Statistics at Vienna. In 1897 he was appointed honorary professor of political economy in the University of Vienna. He published: *Der Unternehmervergewinn* (1884); *Das Recht des Schadenersatzes vom Standpunkt der National-ökonomie* (1888); *Grundriss des Gewerberechts und der Arbeiterversicherung* (1899); *Die Rek-lame* (1910).

MATAMATA, mā'tā-mā'tā (South American name). A large and singular turtle (*Chelys fimbriata*) of Guiana and northern Brazil, typical of the family Chelididae. (See TURTLE.) In old age it is 35 to 40 inches long when the neck is outstretched; its rather flat shell is covered with large roughly conical shield plates in three fore-and-aft rows, with a margin of small rough plates. The plastron is weak and narrow. The neck is very long; the head is small and pointed, with the eyes small and close together; the ear flaps large; and the nose produced into a long soft tube at the end of which open minute nostrils. The jaws are very weak, and partly covered with smooth skin, so that prey (frogs, fishes, and the like) probably are sucked into the widely distensible throat rather than seized. The most remarkable thing about the creature, however, is the fact that its head and throat are covered with fringes of outgrowths of skin, in rows from its face to its shoulders. These float about like weeds as it lies quietly near the surface of the water, and conceal its true character so well that the small animals come within reach unsuspectingly. Not much is known of its life history or habits. See TURTLE.

MATAMOROS, mā'tā-mō'rōs. A town in the State of Tamaulipas, Mexico, on the south bank of the Rio Grande, 23 miles from its mouth and opposite Brownsville, Tex. (Map: Mexico, K 5). Its port is Bagdad (q.v.), and it is the seat of a United States consul, with which country it carries on a large trade. The chief exports are hides, skins, and cottonseed; the chief imports, manufactured goods from Great Britain and the United States. In 1913 its exports were valued at \$2,388,173 and imports at \$1,680,707. At the outbreak of the war between the United States and Mexico the Mexican forces were for some time concentrated here, but after the battle of Resaca de la Palma (q.v.) the city was evacuated and on May 18, 1846, the Americans under General Taylor took possession. Pop., about 10,000.

MATAMOROS, MARIANO (c.1770-1814). A Mexican patriot. Very little is known of his early life or education. He was a priest at a small village called Jantelolco, near Cuernavaca, when in 1811, aroused by the constant insults and atrocities of the Spanish troops, he joined the army of insurgents under command of the patriot Morelos. By him he was raised to the rank of colonel. He took a most important part in the siege of Cuautla (1812) and the capture of Oajaca (1812), and most notably at the victory of San Augustin del Palmar (1813),

which was due almost entirely to his military genius. He took part in the unsuccessful attack on Valladolid (Dec. 22, 1813) and was captured in the defeat suffered by the revolutionists at Puruarán (Jan. 5, 1814). He was court-martialed and shot in the Plaza of Valladolid on Feb. 3, 1814. He was an active and successful leader of the revolution and performed valuable service in organizing the troops and maintaining military discipline. His death was a severe blow to the patriot cause at a very critical moment when it was suffering many reverses. His name has been bestowed on the important town of Matamoros, on the Rio Grande, and upon many smaller towns and districts of the country. By the historians of the time he is considered one of the most skillful of the revolutionary leaders.

MATANÉ, mā'tān'. A town of Rimouski Co., Quebec, Canada, situated on the Inter-colonial and Canada and Gulf Terminal railways (Map: Quebec, A 2). There is steamship communication with Montreal and Gaspé. It is the seat of an extensive lumber industry and has large saw mills. Pop., 1901, 1176; 1911, 2056.

MATANUS'KA RIVER. A stream tributary to Knik Arm, Cook Inlet, Alaska (Map: Alaska, J 5). The Matanuska valley sprang into importance through the legislation of the 62d and 63d Congresses for the construction of railways and for the development of the coal resources of Alaska. The Matanuska coal fields are distant 25 miles from Knik Arm, which is frozen over in winter. The coal varies from subbituminous and semibituminous up to anthracite in quality. Areas aggregating about 47 square miles are underlain by coal, in seams varying from 5 to 36 feet in thickness. Under the Act of Congress of Oct. 20, 1914, the entire area is to be surveyed and 7680 acres of the best coal seams are to be reserved for the exclusive use of the United States. The remaining areas are to be leased, under competition and by the royalty system, for development by American citizens. The Railway Commission of 1913 recommended that a branch line of railway be constructed connecting the Matanuska coal fields with tidewater for the economical transportation of the coal mined. Such line is to be built from the appropriation of \$35,000,000 made by Congress for the construction of government railways in Alaska. Consult Martin, "Matanuska Coal Field," in *United States Geological Survey, Bulletin 239*, and "Railway Routes in Alaska," 62d Congress, 3d Session, House of Representatives, Document 1346. See ALASKA, *Geology, Mining*.

MATAN'ZAS. A province of Cuba, occupying the west-central part of the island and bounded on the north by Florida Strait, on the east and south by the Province of Santa Clara, and on the west by a short coast line on the Ensenada de la Broa and the Province of La Habana (Map: Cuba, D 4). Its area is 3700 square miles. A line of highlands reaching a height of 1300 feet runs along the north coast, but the province as a whole is low, merging towards the south into the large swamps of Zapata. The chief industry is the production of sugar cane and the manufacture of sugar. Oranges, bananas, henequen, sweet potatoes, and corn are extensively grown. The development of the resources of the province has been facilitated by its network of railways. Its extensive

commerce is carried on mainly in Matanzas (q.v.), the capital, and Cárdenas, which rank second and fifth respectively in commercial importance in the island. Pop., 1899, 202,214; 1907, 239,812; 1913 (est.), 266,376.

MATANZAS. The capital of the Province of Matanzas, Cuba, and the third city in population of the Republic (Map: Cuba, D 3). It is situated in an amphitheatre-like location at the head of the Bay of Matanzas on the north coast of Cuba, 44 miles east of Havana. The small rivers Yumuri and San Juan divide the city into three parts: to the north Versalles, a residence district; in the centre Matanzas proper, the commercial and most thickly populated section; and to the south Pueblo Nuevo, the industrial and railway centre. Its streets are straight and regular, and it has a handsome square, the Plaza de la Libertad. In Versalles is the fine drive, Paseo de Martí, with a monument to the memory of the martyrs of independence, beyond which is the old Fort San Severino, a seventeenth-century structure. The principal buildings are the San Esteban theatre, the market, the government building, several churches, the lyceum, and the Spanish casino. The city has a tropical but healthful climate, and although it still has a defective sewage system, sanitary conditions have been considerably improved since the first American intervention. The harbor is large and well sheltered, but owing to lack of improvements vessels are forced to anchor some distance from shore and load and unload by lighters. Matanzas is second only to Havana as a Cuban commercial and railway centre. Its exports are chiefly sugar, molasses, and rum, and its imports, manufactured articles. Industries include a petroleum refinery, which supplies the whole island, sugar refineries, rum distilleries, tanneries, shoe factories, car and machine shops, and guava-jelly factories. Cordage is also manufactured from henequen, grown near the city. The city is the seat of a United States consular agent. Pop., 1907, urban, 39,005; municipal, 64,385. Matanzas was founded in 1693. Its harbor was long the refuge of pirates. The home of the poets Heredia, Milanes, and Plácido, it was once known as the Athens of Cuba. The city is surrounded on the land side by rocky hills, upon the summit of which, to the north, is located the Monserrat Chapel, built in 1875 by a Catalan society and having the retablo of the altar uniquely made of cork brought from Spain. From here one has a view of the Yumuri valley, said to be one of the most beautiful in the world. Three miles east of the city are the caves of Bellamar, with their wonderful variety of stalagmite and stalactite formations.

MAT'APAN', CAPE. See CAPE MATAPAN.

MATARÓ, mā-tā-rō'. A town of northeast Spain, in the Province of Barcelona, situated on the Mediterranean coast 18 miles northeast of Barcelona (Map: Spain, G 2). It is surrounded by vineyards and gardens and has several handsome promenades, a seminary, a school of arts, and the celebrated Colegio de Valldemia. It is an important industrial centre and manufactures cotton and woolen textiles, sailcloth, starch, soap, glass, chemicals, and pigments, especially white lead. There is also some ship-building, but the commerce is insignificant. The railroad between Mataró and Barcelona was the earliest road built in Spain. Pop., 1900, 18,765; 1910, 19,918.

MATAS, māt'ās, RUDOLPH (1860-). An American surgeon, born near New Orleans. He was educated at Barcelona, Spain, at Paris, France, at Brownsville, Tex., and Soule's College, New Orleans, and graduated from the Literary Institute of St. John at Matamoros, Mexico, in 1876, and from Tulane University (M.D.) in 1880. Thereafter he practiced in New Orleans, where he became known as a specialist in surgery after 1895. In the latter year also he was appointed professor of surgery at Tulane. He became senior surgeon of Touro Infirmary, senior visiting surgeon of the Charity Hospital, and first lieutenant in the United States Medical Reserve Corps. He edited the *New Orleans Medical and Surgical Journal* in 1883-95, was elected president of the American Surgical Association in 1909, and served also as president of the Louisiana State Medical Society in 1894-95 and of the Southern Surgical and Gynecological Association in 1911.

MATCHES (OF. *mesche*, Fr. *mèche*, It. *miccia*, match, from ML. *mixa*, Lat. *myxus*, wick, from Gk. *μύξα*, *myxa*, lamp nozzle). Specially prepared pieces of inflammable material designed to enable the user to obtain fire readily. At present the name match, or friction match, is usually applied to a splinter of wood, tipped with some combustible material which will ignite on being rubbed against either a specially prepared or any rough surface. One of the first forms of this useful article was the brimstone match, made by cutting dry pine wood into thin strips about 6 inches long, pointing the ends, and dipping the latter into melted sulphur; thus prepared, the sulphur points instantly ignited when applied to a spark obtained by striking fire into tinder from a flint and steel. Early in the nineteenth century was invented the instantaneous light box, which consisted of a small tin box containing a bottle in which was placed some sulphuric acid, with sufficient fibrous asbestos to soak it up, and a supply of properly prepared matches. The latter were splints of wood which had been dipped first into melted sulphur and afterward into a paste composed of chlorate of potash, powdered loaf sugar, powdered gum arabic, and a little vermilion as coloring matter. By dipping these prepared points into the sulphuric acid the matches were instantly ignited. The chief disadvantages of this device were the danger of using a material so destructive as sulphuric acid, together with its great power of absorbing moisture, which soon rendered it inert.

In 1827 the first true friction match was invented by John Walker, of Stockton-on-Tees, Durham. The inflammable mixture was a compound of chlorate of potash and sulphuret of antimony with enough of powdered gum to render it adhesive when mixed with water and applied to the end of the match, which had previously been dipped in melted brimstone. These matches were ignited by the friction caused by drawing them through a piece of bent sandpaper. Imitations of Walker's matches, known as lucifers, were made by Samuel Jones from 1829 to 1830 and G. F. Watts, and Richard Bell & Co., competitors, also put out lucifers, borrowing the name.

The ignition of sulphur and phosphorus by friction was discovered by Godfrey Haukwitz in 1680, and it was 150 years before this discovery was applied to matches. It is stated that in 1833 phosphorus friction matches were made at

Vienna. About the same time Walker, who invented the original friction match, substituted phosphorus for the former mixture. In 1836 the first improved friction matches were made in the United States by Alonzo Phillips, of Springfield, Mass. The body of these matches is usually of wood, but some, called vestas, are of very thin wax-taper strips and were first patented in 1832 and manufactured a few years later, and latterly cardboard has been employed. The composition of the head of an ordinary match consists of phosphorus and nitre, or phosphorus, sulphur, and chlorate of potash, mixed with melted gum or glue, and colored with vermilion, umber, soot, or other coloring material.

In later processes lead peroxide, red lead, or manganese dioxide were substituted for the nitre. The precise formulas are generally preserved as trade secrets. The simplest and cheapest matches for many years were phosphorus sulphur matches, which lighted easily and were made of white phosphorus, being sold in the splint, card, or block type. These were succeeded in large part by the so-called parlor match with a more inflammable head, where the sulphur was replaced by other chemicals.

To obviate the danger of fire incurred by using matches so readily ignitable as the ordinary or parlor match, safety or strike-on-box matches were put upon the market in 1855 and since have been extensively used. Their inventor was a Swede named Lundstrom. The safety match differs from the ordinary match in having the phosphorus omitted from the composition applied to the match stick and combined instead with sand to form a friction surface on the match box, where the matches, which usually have chlorate of potash in their heads, are rubbed in order to be lighted. The dipping composition varies in different brands, most of which are made in European countries rather than in America, where the output is relatively small, though the quality good. In the United States double-top or double-dip matches have in large measure supplanted the parlor or single-dip type. They contain a large flame-producing head of highly inflammable material containing no phosphorus and a cap that may or may not contain phosphorus. Such matches strike anywhere and easily and were first proposed in 1898 and again in 1899. They were put upon the American market in 1905.

The constant handling of ordinary white or yellow phosphorus is a very unhealthful occupation, the emanation of phosphorus oxides giving rise to necrosis, or mortification of the bones of the jaw, producing the so-called "phossy jaw" disease once common in the match industry. In the early days of match manufacture the industry was largely carried on, in European countries, in cellars, and deaths from necrosis were so common that government intervention was necessary to drive the manufacturers into more sanitary quarters. In the modern match factory better surroundings, the increased use of mechanical appliances, and the smaller amount of phosphorus used have greatly decreased the danger incurred by matchmakers. It can, however, be entirely removed if the more expensive red or amorphous phosphorus, or the sesquisulphide of phosphorus, be used in its stead.

To-day the use of white phosphorus is in large measure prohibited or placed under restriction. The first step was taken in 1875 when Denmark forbade its use, and this was followed by Switzer-

land in 1879. In 1906 an international conference was held at Berne and a treaty proposed, which was followed by laws prohibiting the sale or importation of matches made of the white or yellow phosphorus in Switzerland, Luxemburg, Germany, France, Netherlands, Austria, and Spain. In 1908 the White Phosphorus Matches Prohibition Act was passed in Great Britain, and since 1910 it has been illegal to import or sell matches containing white phosphorus. The evil effects of white phosphorus were realized also in the United States, and it was proposed in 1910 to deal with the matter by a heavy internal revenue tax on all matches made from white phosphorus. In fact, this was recommended by President Taft in a message to Congress. On Jan. 27, 1911, the Diamond Match Company, the largest manufacturers in the United States and the sole owners of patents for the use of tetraphosphorus trisulphide in America, surrendered these patents for cancellation so that the process could be used by any one and thus avoid the dangers of white phosphorus. The Esch-Hughes Nonpoisonous Match Act, which made white phosphorus matches impossible through heavy taxation, became effective July 1, 1913, and practically rendered obsolete the old white phosphorus matches made in the United States. In their place there was employed practically universally for the prime igniting ingredient a nonpoisonous sesquisulphide of phosphorus compound which required for its ignition a temperature of about 210° F. as compared with white phosphorus which ignites at an ordinary room temperature. The white phosphorus matches would ignite at a temperature of 150°-200° F., while the sesquisulphide of phosphorus variety would ignite at 300°-350° F. The bill for safer matches received the approval also of the fire-prevention interests, as matches were a prolific source of fires. The old-fashioned matches were often ignited by rats and other rodents, who will not eat the sesqui matches.

In the better grades of matches, to prevent the smoldering of the burnt stems, the sticks or splints are usually soaked or impregnated in a solution of magnesium sulphate, alum, or sodium phosphate before the head is formed by dipping; this is done for both safety and strike-anywhere matches.

In the United States, as in most European countries, the sale of matches is regarded in much the same light as that of explosives and combustibles, and is regulated by State laws or municipal and insurance fire regulations which prescribe in detail the number of and conditions under which matches may be stored. In some States and cities the kind of match is also restricted, and only those considered reasonably safe are specified in the regulations, while the Underwriters' Laboratories will approve certain types and brands of matches which meet their conditions. Model match laws are now found in several States and in the ordinances of a number of cities.

In Great Britain, Norway, Sweden, Germany, Austria, China, and Japan the matchmaking industry has assumed enormous proportions. In France the making of matches is a government monopoly. In the United States the match industry is highly competitive; the Diamond Match Company making about 60 per cent of the matches consumed in the country, estimated at 250,000,000,000 a year. There are about a

dozen manufacturing companies in America, and the Diamond Match Company operates four factories. Much ingenious and automatic machinery is used in its factories. The first step in the manufacture of larger ordinary and safety matches is to prepare the splints from blocks of pine from which all knots and cross-grained portions have been removed. This wood comes in the form of planks 2 inches thick and is thoroughly dried. It is then sawed into lengths of from $1\frac{1}{8}$ to $2\frac{1}{2}$ inches, or the length of an ordinary match. A machine now receives these blocks, and they are cut by knives or dies into rows of splints, each row containing splints for 44 matches. Each row of splints as it is cut from the block is placed in cast-iron plates which are formed into an endless chain. The machine makes from 175 to 250 revolutions a minute, and, as has been said, at each revolution 44 matches are cut and set. Another important type of machine for the smaller matches makes the splints or sticks by cutting off veneers by a log-peeling machine. These are then cut into rectangular match sticks and are "cleaned" and straightened. After the splints have been cut and set in the plates they are carried over a drying or heating block, where they are heated in order that the melted paraffin may not become cold on the exterior of the stick, but may saturate the end thoroughly. The paraffin and the composition which forms the head of the match are placed in proper receptacles, which are automatically replenished without stopping the machine. Through these the splints pass, and at the composition rollers the head of the match is received. As the chain carries the bundles along the matches are cooled and dried by blasts

In England and parts of continental Europe match boxes once were made by hand by laborers as a household industry, but latterly in many countries, as in America, the making of boxes is effected by automatic machinery and is a part of the matchmaking establishment.

The following figures show the value of matches exported from and imported into the United States for selected years:

YEAR	Imported	Exported
1900.....	\$156,705	\$95,422
1905.....	187,951	52,834
1910.....	372,945	80,877
1911.....	588,309	77,106
1912.....	510,146	92,851
1913.....	730,170	102,407
1914.....	882,795	77,736

The following estimate of the match production of the world for 1910 affords a comparative idea of the industry:

COUNTRY	Gross of boxes per annum
United Kingdom.....	17,250,000
Sweden and Norway.....	24,290,000
Germany and Austria.....	14,000,000
France.....	4,800,000
America.....	21,800,000

The development of the match industry in the United States is shown by the accompanying table from the thirteenth United States census, which includes the statistics of the various establishments that manufacture friction, parlor, and safety matches. These statistics cover the various censuses of 1849 to 1909 inclusive:

YEARS	Number of establishments	Wage earners (average number)	Wages	Cost of materials	Value of products	Value added by manufacture
1909	26	3,631	\$1,389,719	\$4,598,878	\$11,353,138	\$6,754,260
1904	23	3,185	1,100,890	3,284,855	5,646,741	2,361,886
1899	22	2,047	612,715	3,420,740	6,005,937	2,585,197
1889	27	1,696	473,556	935,008	2,193,638	1,258,630
1879	37	2,219	535,911	3,298,562	4,668,496	1,369,934
1869	75	2,556	616,714	1,179,666	3,540,008	2,360,342
1859	75	1,252	179,450	229,720	698,566	468,846
1849	60	1,021	154,620	137,514	427,823	290,309

of air, and finally they are automatically removed and packed in appropriate boxes. One such machine will yield 100 gross of boxes per day and requires the attention of eight girls. The boxes, which have been made by automatic machinery too, are fed into the machine automatically, and after receiving their contents are discharged on a rotating table, where they receive their covers at the hands of girls, two to four being employed at each table. After the chain has discharged its matches into boxes it is ready for a fresh set of splints, and the operation proceeds continuously.

The use of automatic machinery is also applied to the manufacture of so-called book matches, where strips of cardboard, separated so as to form individual matches, are bound in cardboard cases with a striking surface. An automatic machine prints the cardboard, cuts it into combs, dips the ends in the igniting mixture, folds it, stitches it into books, and affixes to the outside the patent striking composition. These book matches, which have found wide vogue, especially for advertising purposes and for pocket match safes, date from about 1899.

MATE (ODutch *maat*, Dutch *maat*, Ger. *Maat*, companion). In the merchant service mates are the officers of a ship subordinate to the master. Large vessels have a first, second, third, and sometimes a fourth mate; smaller ships have one or two less. In steamers they are now very commonly called first officer, second officer, etc. (instead of first mate, second mate). The first or chief mate performs the duties of executive for the master. In port he superintends and directs the stowage and discharge of cargo and has general care of the ship. At sea he assists the master in navigating and keeps the log; in most ships he has command of the port watch. His qualifications are superior to those required of the other mates, and he is usually, like the master, appointed by the owners and may be discharged by them only, except in unusual circumstances. In case of the death or disability of the master he succeeds to the command. The second mate commands the starboard watch at sea. He is not usually required to have a thorough knowledge of navigation, but should be a thorough seaman capable of directing the men in any kind of seamen's work. The

third and fourth mates (when there are such) have duties similar to those of a second mate. Very large steamers, such as the great transatlantic liners, have more than four mates or officers of this status. A mate in the United States navy is technically a petty officer, but is classed with warrant officers, though junior to them and holding only an appointment instead of a warrant. The uniform is similar to that of warrant officers. Mates were formerly called master's mates and a large number of them were in service during the Civil War. Boat-swain's mates, gunner's mates, carpenter's mates, machinist's mates, etc., are petty officers and wear the appropriate petty officer's uniform. See PETTY OFFICER.

MATÉ, mā'tā, or PARAGUAY TEA (abbreviation of Spanish *yerba de maté*, calabash herb). A substitute for tea, extensively used in South America, and almost universally through Brazil. It consists of the leaves and green shoots of certain species of holly (q.v.), more especially *Ilex paraguayensis*, dried and roughly ground. The true maté is a large shrub or small tree with smooth leaves and axillary umbels of small flowers. The leaves of a number of other species of *Ilex* are mixed with maté, and sometimes it is adulterated with leaves of plants in no way related to it. The term "maté," which has by usage become attached to this material, belongs originally to the vessels in which it was infused for drinking; these were usually made of gourds or calabashes, often trained into curious forms during their growth. Into the hollow vessels thus formed a small quantity of the material is put, and boiling water is added. The original method of drinking was as follows: each person who was to partake of the beverage was provided with a small tube about 8 inches long with a bulblike strainer at one end made either of fine basketwork or of perforated metal to prevent the fine particles from being drawn up into the mouth, and when his turn came he dipped in his tube (bombilla), sucked up a small portion of the infusion, and passed the maté bowl on to the next person. It is extremely unpleasant to Europeans at the high temperature at which it is usually drunk. The effect of maté is much the same as that of tea, stimulating and restorative, owing to the presence of a large proportion of caffeine. The collection and preparation of maté is a large industrial occupation in Paraguay and Brazil, upward of 5,000,000 pounds of maté being annually exported from Paraguay to other parts of South America, but it is not yet an important article of export to other quarters of the world. See Plate of BEVERAGE PLANTS.

MATEHUALA, mā'tā-wā'lā. A town in the southern part of the State of Nuevo León, Mexico (Map: Mexico, J 6). It has wide and straight streets and several plazas, one containing a garden and a statue of Neptune. There are silver, gold, and copper mines in the neighborhood, and the town has several silver-smelting establishments. Pop., 12,000.

MATEJKO, mā-tā'kō, JAN ALOYSIUS (1838-93). A Polish painter, born at Cracow. He studied at the art school in his native town, then went to Munich, and afterward studied at the Vienna Academy. In 1873 he was appointed director of the Cracow Art School. He was awarded a first-class medal at the Paris Exposition of 1867 and a medal of honor in 1878. His principal works are large paintings of inci-

dents in Polish history and include an "Episode from the Diet at Warsaw" (1867, Vienna Museum); "The Union of Lublin, 1569" (1875); "Wernyhora Prophesying the Future of Poland"; "Albrecht von Brandenburg Doing Homage to King Sigismund I" (1882, National Museum, Cracow); "John Sobieski Raising the Siege of Vienna" (Vatican, Rome); "Declaration of the Polish Constitution" (1892). They are spirited in conception and notable for the archaeological knowledge displayed in their detail, but are usually glaring in color and confused in composition. He also painted excellent portraits and published *Ubiór w Polsce* (1860), a work representing the costumes of the Polish nation from 1222 to 1795. Many of the best present-day Polish painters were pupils of Matejko.

MATERA, mā-tā'rā. A city of the Province of Potenza, Italy, 34 miles west-northwest of Taranto (Map: Italy, F 4). It is irregularly built on steep slopes, 1300 feet above the sea. The roofs of the houses of the lower streets are on a level with the roadbeds of the upper streets. The principal buildings are an episcopal palace, a cathedral, and a college. Matera has manufactures of leather and arms and a trade in oil and agricultural produce. In the vicinity are the famous troglodyte caverns of Monte Scaglioso, still used as dwelling places by some of the lower classes. Matera is the seat of an archbishop. Pop. (commune), 1901, 17,237; 1911, 17,324.

MATE'RIALISM (from *material*, from Lat. *materialis*, relating to matter, from *materia*, matter). Usually defined as the philosophical view which resolves all existence into matter or into an attribute or merely an effect of matter. It makes matter the central ultimate reality and makes everything else, consciousness included, a derivative appearance, which is then sometimes treated as illusory. When consciousness is treated as illusory, materialism is suicidal, for the simple reason that materialism can have meaning only for a conscious being, and if consciousness is treated as a vain show, materialism can consistently be regarded only as one of the varieties in the show. But such an attitude towards consciousness is not to be consistently maintained (see KNOWLEDGE, THEORY OF); hence the only forms of materialism we need here consider are those that regard consciousness as an effect or as an attribute of matter, which, following Külpe, we shall call the causal and the attributive forms of materialism.

The attributive form assumes that substance is what the etymology of the word would suggest—viz., a permanent unchanging entity which furnishes the support for various appearances; these appearances, as referable to the substance, are called its attributes. Materialism of this type regards this substance as an extended, impenetrable, movable entity, which in some way has inhering in it or resting upon it or referable to it the attribute of consciousness, which may be treated as either a separable or an inseparable mark. This method of dealing with the relation of matter and consciousness is charmingly simple, but it is the simplicity of uncritical thought. It must be discarded along with the notion of substance (q.v.) interpreted as substratum. Substance is, properly speaking, nothing but the unitary complex of qualities called attributes. Instead of being simple, substance has a complexity measurable only by the number of attributes it possesses. Not that it is a mere com-

pound; it is unitary in the sense that all the attributes organize themselves simultaneously or successively into a single differentiable object. Now, if any substance has consciousness as an attribute, that substance is by that token a conscious substance, and to call it merely material is to be blind to the fact that materiality is as much an attribute as color or duration. If matter is always or sometimes conscious, it is not matter as ordinarily conceived. To call this conscious thing matter is not to take a philosophical attitude but to set up as a lexicographical reformer.

Causal materialism is true or false according to the interpretation put upon cause; but even when that interpretation is true, materialism is only a half truth, for in that case matter is as dependent on mind as mind is on matter. If by cause is meant anything but the invariable condition of an event, causal materialism is questionable, for there is no reason to suppose there is any such cause. (See CAUSALITY.) But if by cause is meant an invariable condition, then all experience warrants us in saying that a certain organization of matter is cause of consciousness. Such a statement, however, says nothing about the nature of consciousness except that it requires, as a condition of its appearance at a certain time, that there should be in existence at that time some sort of nervous organization. If one proceeds to say that the physical world is not in its turn dependent on the psychical, that statement must be challenged. If the statement merely means that some form of physical existence preceded in time any ascertainable form of consciousness, no valid objection can be raised; but if it means that the physical can be conceived to exist out of all relation to the psychical, then the assertion is questionable. For every judgment is passed upon reality as it appears to the judging consciousness. Reality apart from a judging consciousness is *eo ipso* unknowable. But this impossibility of the knowledge apart from consciousness is not the impossibility of an existence antedating consciousness. Relation to consciousness there must be in any conceivable reality; but the relation need not be one of simultaneity. It is indubitable that we can know things which do not exist at the time we know them. But if there can be knowledge of things which antedate the knower, there is nothing impossible in the supposition that knowable, if not known, objects were themselves the causes of the succeeding knowledge. But if they were causes of the succeeding knowledge, then the succeeding knowledge is an integral element in the system of which the cause is likewise a determining element. In other words, effect and cause are reciprocal and both are indispensable in the causal system. It is only when the time order is taken in the historical sense that cause is considered more important than the effect. This is not to say that the effect is the cause of its cause, for cause means indispensable *antecedent*, and that is what the effect, as effect, is not. But it is indispensable nevertheless. For instance, if the universe is of such a nature that the interposition of an opaque body between a luminous body and an eye means an eclipse of the luminous body, the absence of such an eclipse carries with it the absence of such an interposition. This same principle would make consciousness, which is the result of physical conditions, itself an indis-

pensable element in the universe in which its causes existed. One cannot admit the existence of the physical cause of a psychic effect without admitting the existence of the psychic effect. In other words, we cannot conceive consciousness absolutely absent from the universe; we cannot think away consciousness from its place in the universe without thinking away this very thinking, i.e., without doing the impossible. We may ignore our own consciousness and that of others in our philosophical system, but if we do, so much the worse for our system. What a system of reality could be that had no place in it for a knowing mind, no knowing mind in that system could say. This point is forcibly presented by Prof. H. S. Jennings from the biological side. "*Every diversity in conscious states is accompanied by a diversity in physical conditions . . . it follows also that every diversity of conscious states (plus the concomitant physical conditions) is preceded by a diversity in physical conditions.*" Such being the case, the question whether the same antecedent physical conditions without consciousness would produce the same or a different result contains contradictory specifications and is without experimental meaning. For without consciousness, and indeed the particular given kind of consciousness, the physical conditions are not the same. No experimental meaning can be given to the question whether it is the antecedent physical diversity or the antecedent conscious diversity that is efficacious in producing the diversity of results, for the two are inseparable.

Now the materialist who makes consciousness an effect of matter, but not itself an indispensable element in the universe, fails to see this logical interrelation of effect and cause. A materialist who recognizes this interdependence ceases thereby to be a materialist, for now in his theory his reasons must be acknowledged to be as much characterized by mental facts when and whence those facts are, as it is characterized by physical facts when and where these latter facts are. Neither is independent, although one may be prior. The materialist looks at the priority and overlooks the interdependence. One consequence of overlooking this interdependence is the assumption that the laws of matter are the only natural laws. Consciousness is regarded as running its course in accordance with mechanical principles. Hence will be of no determining value. It is this corollary from materialism that has made the doctrine so distasteful to the ordinary thinker. For this corollary means the denial of moral responsibility. But the results of the renewed study of psychology within recent years have made it quite impossible to assert that the laws of consciousness are mechanical laws as these laws manifest themselves in the purely material part of the universe. See MECHANISM.

Materialism is an old view; all the Ionic philosophers (see IONIAN SCHOOL) were by implication materialists; Democritus, Leucippus, Epicurus, and Lucretius (see articles on them) worked out a quite elaborate materialistic system. There is a materialistic vein running through the thought of many of the Italian philosophers of the Renaissance. Gassendi, likewise, makes consciousness, at least in the form of feeling, an inseparable attribute of matter. The eighteenth century was especially marked by its materialistic philosophy. Priestley in England and La Mettrie, Diderot, and Holbach

in France were outspoken in their materialism of the attributive kind. The latter part of the eighteenth century and the early part of the nineteenth century were characterized by a strong antimaterialistic reaction, to be followed again in the middle of the latter century by a strong outburst of materialistic thought. Carl Vogt, Jacob Moleschoot, Louis Büchner, and Heinrich Czolbe carried on a vigorous propagandism in favor of materialism, but the results of the scientific study of psychology were too patent, and the nineteenth century went out with a strong dislike for the view that made matter the one essential reality. Many systems of thought of the present day are styled materialistic by their opponents, but are really not materialistic at all, inasmuch as they recognize the indefeasibility of consciousness.

Bibliography. For an excellent history of materialism, see F. A. Lange, *Geschichte des Materialismus* (6th ed., Leipzig, 1896; Eng. trans. of earlier ed. by E. C. Thomas, London, 1877-80); also: Herbert Spencer, *System of Synthetic Philosophy* (new ed., New York, 1910); James Martineau, *Modern Materialism* (Boston, 1876); A. Stadler, *Kant's Theorie der Materie* (Leipzig, 1883); W. F. Wilkinson, *Modern Materialism* (London, 1883); R. Abendroth, *Das Problem der Materie* (2 vols., Leipzig, 1889-90); E. K. Shettle, *Origin of Matter and Force* (London, 1897); Josiah Royce, *The World and the Individual* (2 vols., New York, 1900-01); Ernest Haeckel, *Riddle of the Universe* (ib., 1901); James Ward, *Naturalism and Agnosticism* (2d ed., 2 vols., ib., 1903); J. M. Baldwin, *Dictionary of Philosophy and Psychology*, vol. iii (ib., 1905); I. W. Riley, *American Philosophy: The Early Schools* (ib., 1907); Adolf Stohr, *Philosophie der unbelebten Materie* (Leipzig, 1907).

MATERIALS, STRENGTH OF. See **STRENGTH OF MATERIALS.**

MATERIA MEDICA (Lat., medical material). That department of the science of medicine which treats of the materials employed for the alleviation and cure of disease: (1) their physical properties; (2) various modes of preparation; (3) chemical composition and relations, including the tests for purity and the means of detecting probable adulterations; (4) physiological action on man and animals in large and small doses; (5) therapeutic actions and uses, and the average doses in which they should be prescribed; and (6) the official preparations containing the substances in question, and their uses. Strict classification of drugs into groups according to their physiological action is impossible, as their action is so complex that one would often be found in several classes. It is, however, customary to group them according to their most marked or important characteristic for convenience of description and ease in recalling those having a common action. See **THERAPEUTICS**; **PHARMACOPEIA**.

MATÉRIEL, mǎ'tǎ'rě'el' (Lat. *materialis*, relating to matter). The term in its military sense is applied to the completed units of military and naval armament, stores, transportation, and equipment, as distinguished from the *materials* of which such units are constructed. A gun is part of the *matériel* of artillery; the *material* in the gun is principally steel.

MATERNA, mā-tēr'ná, AMALIE (1847-1918). An Austrian opera singer, born in St. Georgen,

Styria. She made her first stage appearance in Graz, 1864, and in the same year married Karl Friedrich, a well-known actor, and with him was engaged at the Carl-Theater, Vienna. Her début as a prima donna occurred in 1869, when she sang at the Imperial Opera as Selika in *L'Africaine*. In 1876 she created the part of Brunhilda at Bayreuth. She became one of the greatest sopranos of the early Wagnerian opera, and a great favorite in the United States. She retired in 1897.

MAT GRASS. See **AMMOPHILA**; **NARDUS**.

MATHEMATICAL SOCIETY, THE AMERICAN. A national association for the advancement of mathematical science. It was reorganized under its present name in July, 1894, and has a membership of about 700. Its library of some 5000 volumes is deposited in the library of Columbia University. Meetings are held three times a year in New York City and twice a year at Chicago. There is also a general summer meeting, and sectional meetings are held in California and in the central West. The society publishes two journals, the *Bulletin* and the *Transactions*, and has issued several volumes of *Colloquium Lectures*. The list of ex-presidents includes Emory McClintock, G. W. Hill, Simon Newcomb, R. S. Woodward, E. H. Moore, T. S. Fiske, W. F. Osgood, H. S. White, Maxime Bocher, H. B. Fine, E. B. Van Vleck, and E. W. Brown.

MATHEMATICAL SOCIETY, THE LONDON. An association founded in 1865 by a number of English mathematicians and incorporated in 1894. It was instituted for the promotion of mathematical knowledge. The society owns an excellent library of books and periodicals on scientific subjects. The society began in 1865 the publication of the *Proceedings of the London Mathematical Society*, and has now over 35 volumes of essays upon advanced mathematical topics. During the session 1913-14 over 40 papers were read on mathematical subjects and 20 of these were published. The meetings are held on the second Thursday in each month, from November to June, and the anniversary meeting is in November. The president in 1914 was Professor A. E. H. Love, F.R.S., and the honorary secretary, J. H. Grace, F.R.S.

MATHEMATICS (Lat. *mathematica*, from Gk. μαθηματικά, *mathēmatikē*, mathematics, from μάθημα, *mathēma*, learning, science, from μάθεω, *manthanein*, to learn). The technical meaning of the word is due to the Pythagoreans, who distinguished four branches: "There are four degrees of mathematics: arithmetic, music, geometry, spherics." In modern times attempts have frequently been made to frame a satisfactory definition of the scope of the science. Descartes asserts that "all sciences which have for their object the search after order and measure belong to mathematics." D'Alembert in the *Encyclopédie* defines it as the science which considers the properties of magnitude in so far as this is calculable or measurable. Comte, in his *Philosophie positive*, speaks of it as the science which proposes to determine certain magnitudes from certain others from the exact relations that exist between them. Sagnet has proposed the following: "Mathematics have for their object the study of exact and necessary relations concerning the magnitude, the form, and the relative position of various objects, material or immaterial, which appeal to our senses." With regard to these definitions it may be observed that

they are all based on concepts such as "magnitude," "order," "measure," which are themselves extremely difficult to define.

History. Mathematics as a science makes its first definite appearance among the Egyptians. There are evidences of its antiquity among the Chinese, Hindus, and Babylonians, but the earliest written records of considerable mathematical progress are found in Egypt, and give an interesting view of the state of the science as early as the latter part of the third millennium before Christ. At that time arithmetic was sufficiently developed to include a fair numerical system, a cumbersome but elaborate treatment of common fractions, and some work in finite series. A limited and imperfect system of mensuration was known, a beginning was made in algebraic symbolism, and the simple equation was solved. Of the several mathematical papyri that have come to light in recent years the most elaborate is that transcribed by Ahmes about 1700 B.C., from one written probably some six or eight centuries earlier. Mathematics in Egypt, however, made but slight progress beyond this point until the Greek ascendancy in Alexandria. The Babylonians were the next to show signs of mathematical power, particularly in the application of arithmetic and geometry to astronomy. To them is due the suggestion of the sexagesimal system of fractions developed by the Greeks and still commonly used in angle and time measurements. The extensive trade of the Phœnicians also developed a commercial arithmetic among themselves and their neighbors, but it did not lead to any general scientific progress.

The real beginning of mathematics as a steadily progressing science is to be found in Greece, and in particular in the establishing of the Ionian school of Thales (q.v.) about 600 B.C. Geometry as a science here makes its appearance. The next great step in the progress of mathematics was taken by Pythagoras (q.v.) in founding his famous school at Crotona in southern Italy. Under his influence a considerable part of elementary geometry became developed, and a beginning was made in creating a theory of numbers. (See NUMBER.) Considerable progress had been made in geometry before the third epoch-making step was taken, the founding of the Athenian school about 420 B.C. Hippocrates of Chios began the movement that made Athens the mathematical centre for the next century and a half. It was Plato, however, who brought the school to the zenith of its fame. Although he was not, strictly speaking, a mathematician, his ideas concerning the methods of establishing truths in philosophy and science gave a powerful impulse to the progress of mathematics. The third century B.C. saw the rise of the great Alexandrian school, where Euclid taught and where Archimedes, Apollonius, and Eratosthenes studied. With that century closes the Hellenic ascendancy in mathematics and philosophy, and thenceforth we find scientific progress sporadic and short-lived. By the second century of our era progress had practically ceased. Heron and Ptolemy were the greatest of the later Greek writers on applied geometry. The only new movement in mathematics made by the post-Christian Greeks was that of Diophantus, whose work on equations is the first of any pretensions ever composed. The Romans did almost nothing in mathematics except in a purely mercantile way, their only contribution being to the practical work of surveying. Among the later

Romans the name of the philosopher Boëthius stands out with some prominence for his textbook work in elementary mathematics, but he displayed no originality. The same must be said for such mediæval writers as Alcuin, Gerbert (see SYLVESTER), and Bede.

Meanwhile mathematics had obtained a foothold in the East. The Chinese early showed a taste for the science, particularly as related to astrology and astronomy. The first definite trace of really satisfactory work among the Oriental peoples, however, is that of Aryabhatta early in the sixth century A.D. Aryabhatta possessed considerable knowledge of the theory of numbers, of algebra, and of the first principles of trigonometry. The next Hindu mathematician of great prominence was Brahmagupta, who lived in the seventh century, and whose work on arithmetic and algebra and on the mensuration of solids is a distinct advance on that of his predecessors. The list of prominent Hindu mathematicians includes the name of Mahavir (Mahaviracarya), and closes with Bhaskara in the twelfth century, in whose work a fairly well developed algebraic symbolism is found. It was among the Hindus, too, that our present numeral system started, being by them transmitted, through the Arabs, to Europe. (See NOTATION; NUMERALS.) One of the most interesting periods in the development of mathematics is that of the Arab ascendancy, and in particular that of the founding of the great school at Bagdad. In this school one of the first teachers was Al Khuwarizmi, who gave the name to algebra in the ninth century. He was followed by several writers of prominence, but, if we except the science of trigonometry, it is rather by their preservation of Greek and Hindu learning than by their own originality that they are noteworthy. Among the last of the Persian and Arab writers was the poet Omar Khayyam, whose work in algebra showed considerable power. The work of the Arabs in Spain was rather that of teaching than of contributing to scientific advance.

The first of the European writers to contribute in any large way to the advance of mathematics was Leonardo of Pisa, at the opening of the thirteenth century. His *Liber Abaci* placed before Italian scholars the Hindu number system (already slightly known) and the mathematical knowledge of the world at that time. The period of the Renaissance was one of great activity in mathematics. This activity was inaugurated in Austria by Regiomontanus and Peuerbach and in Germany by Widmann. In Italy Paccioli was the first to publish, in 1494, any modern printed work of much importance on mathematics, although an edition of Euclid had already (1482) appeared, besides several minor works, notably one on arithmetic printed at Treviso in 1478 and two printed at Bamberg in 1482-83. During the sixteenth century the Italian algebraists, notably Tartaglia, Ferro, Cardan, Ferrari, and Bombelli, solved completely the cubic and biquadratic equations, and Vieta, in France, so improved the symbolism of algebra and so generalized the use of letters as to put algebra upon substantially the present foundation. It needed only the symbolism suggested by Descartes and a few of his contemporaries to bring elementary algebra, about 1650, to the form familiar to students at the present day.

About the time that elementary algebra was becoming crystallized a revival of interest in

geometry took place. On the side of pure geometry this was led by Kepler, Desargues, and Pascal, while to Fermat and Descartes is due the invention of the method of analytic geometry. At the same period Fermat laid the foundation for the modern theory of numbers, and the new theory of logarithms (q.v.) became generally known. The greatest progress in the seventeenth century is, however, represented by the invention of the fluxional calculus by Newton and of the differential calculus by Leibnitz. These disciplines, essentially the same and so considered at present, revolutionized mathematics and its applications.

The period of the development of elementary mathematics closes with the seventeenth century. The eighteenth century was devoted largely to the investigations of the foundations of the new analysis, to a consideration of its applications, to the study of infinite series (see SERIES), and to the understanding of the nature of complex numbers (q.v.). The nineteenth century saw the development of the so-called modern mathematics, including subjects discussed in the articles on SUBSTITUTION; QUATERNIONS; SURFACE; CURVE; COMPLEX NUMBER; DETERMINANTS; FUNCTION; and the more general articles on ALGEBRA, GEOMETRY, TRIGONOMETRY, NUMBER, and CALCULUS.

Classification. No entirely satisfactory classification of mathematics is possible. The various branches are so interrelated that exact lines of separation cannot be drawn, a fact of apparent and great advantage to the science. The most recent attempt at classification is that made in the *Encyclopädie der mathematischen Wissenschaften*. The following scheme covers the principal subjects discussed:

I. PURE MATHEMATICS

A. Arithmetic and Algebra.

(a) Arithmetic (q.v.).

- (1) Fundamental operations with pure numbers. See NUMBER; ARITHMETIC.
- (2) The combinatory theory, including combinations, permutations, determinants. See PERMUTATIONS AND COMBINATIONS.
- (3) Irrationals and the convergency question. See NUMBER; IRRATIONAL NUMBER.
- (4) Complex numbers (q.v.).
- (5) Mengenlehre, literally the "multitude theory"; as of a multitude (unlimited number) of points.
- (6) Finite discrete groups. See SUBSTITUTION.

(b) Algebra (q.v.).

- (1) Fundamental concepts, including rational functions. See FUNCTION.
- (2) Theory of invariants. See FORMS.
- (3) Theory of equations. See EQUATION.
- (c) Theory of numbers. See NUMBER.
- (d) Theory of probabilities. See PROBABILITY.

B. Analysis.

(a) Analysis of real quantities.

- (1) Differential and integral calculus. See CALCULUS.
- (2) Differential equations. See EQUATION.
- (3) Continuous transformation groups. See SUBSTITUTION.
- (4) Infinite series.
- (5) Calculus of variations.

(b) Analysis of complex quantities.

- (1) General theory of functions. See FUNCTION.
- (2) Special kinds of functions, elliptic, Abelian, automorphic, etc.
- (3) Functional equations and operations.

C. Geometry (q.v.).

(a) Pure geometry. See GEOMETRY.

- (1) General principles and elementary geometry.
- (2) Positional geometry.

(3) Projective geometry. See GEOMETRY; PROJECTION.

(4) Descriptive geometry. See GEOMETRY.

(b) Algebra and analysis as applied to geometry. See ANALYTIC GEOMETRY.

(1) Coördinate systems. See COÖRDINATES.

(2) Conics.

(3) Algebraic curves and surfaces.

(4) Space of n dimensions. See GEOMETRY.

(c) Differential geometry, including transcendental curves and surfaces.

II. APPLIED MATHEMATICS

A. *Mechanics* (q.v.), including kinematics, kinetics, statics, the vector analysis (see QUATERNIONS), hydrodynamics, and the theory of elasticity.

B. *Physics* (q.v.), including thermodynamics, molecular physics, electricity, optics.

C. *Geodesy and Geophysics*, including navigation, geodetic mensuration, cartography, magnetism.

D. *Astronomy*.

Bibliography. Select special bibliographies may be found in most of the articles on mathematical topics. Following are some of the best-known general works on the history of mathematics: H. Suter, *Geschichte der mathematischen Wissenschaften* (Zurich, 1873-75); Hermann Hankel, *Zur Geschichte der Mathematik im Altertum und Mittelalter* (Leipzig, 1874); *Abhandlungen zur Geschichte der Mathematik* (ib., 1877 et seq.); Moritz Cantor, *Vorlesungen über Geschichte der Mathematik* (8 vols., ib., 1880-1908); H. G. Zeuthen, *Die Lehre von den Kegelschnitten im Altertum* (Copenhagen, 1886); Fink, *History of Mathematics* (Chicago, 1900), forming a brief compendium of Cantor's work; Florian Cajori, *A History of Mathematics* (New York, 1894); H. G. Zeuthen, *Vorlesungen über die Geschichte der Mathematik* (Copenhagen, Ger. trans. in 1895); W. W. R. Ball, *Short Account of the History of Mathematics* (London, 1901); Florian Cajori, *A History of Elementary Mathematics* (New York, 1901); Johannes Tropke, *Geschichte der Elementar-Mathematik* (Leipzig, 1902-03); D. E. Smith, *History of Modern Mathematics* (4th ed., New York, 1906); W. W. R. Ball, "European Science in the Seventeenth and Earlier Years of the Eighteenth Centuries," in *Cambridge Modern History*, vol. v (Cambridge, 1908); H. G. Zeuthen, *Die Mathematik im Altertum und im Mittelalter* (Leipzig, 1912). The *Bibliotheca Mathematica* (Leipzig), edited by Eneström, is devoted to the history of the subject. For the general bibliography of the science, consult the elaborate *Encyclopädie der mathematischen Wissenschaften*, the publication of which was begun at Leipzig in 1898, also the invaluable *International Catalogue of Scientific Literature: Mathematics* (London, 1902 and annually). Complete records of the recent publications touching mathematical subjects may be found in the *Jahrbuch über die Fortschritte der Mathematik* (Berlin, since 1871).

MATHER, māt'hēr, COTTON (1663-1728). A colonial divine and author, eldest son of Increase Mather (q.v.) and Maria, daughter of John Cotton (q.v.). He was born in Boston, Feb. 12, 1663. He was very precocious and was unfortunately overestimated and praised, with the result that he became morbidly self-conscious. An omnivorous reader from the first, he entered Harvard at 11 and graduated in 1678 at 15. At 16 he studied medicine, despairing of being able

to enter the ministry on account of a propensity to stammering. This he conquered by methods of deliberate speech, and at 17 preached his first sermon and became an assistant to his father. He took his master's degree in 1681, refusing a call to New Haven, and became associate pastor with his father in the North Church of Boston. In 1686 he married; two years later his father's mission to England left him at the age of 25 in sole charge of the North Church, and probably the most important man in Boston. He was widely celebrated as a scholar and was the obvious leader of the conservative element among the Puritans of the day. He had also begun to take a great interest in the subject of witchcraft, his *Memorable Providences Relating to Witchcraft and Possessions* appearing in 1689. During the witchcraft epidemic at Salem in 1692 he became an infatuated investigator of suspected cases, a constant adviser of the magistrates, and wrote his *Wonders of the Invisible World* (1693) to confute all doubters. In 1693 Mather planned his great ecclesiastical history of New England, the *Magnalia*, which was finished in 1697 and finally appeared in 1702. Meanwhile he was overworked and much troubled by attacks made upon him for his activity in the witchcraft crisis. He was also much worried by his father's troubles as president of Harvard, and later was disappointed in not himself receiving the position. He had family troubles, and was furthermore doomed to see more liberal forms of religious thought prevailing around him. Nevertheless, he continued to be a prominent and useful citizen, waging war on intemperance and other forms of immorality. In 1703 he married again. In 1707 a final breach with Governor Dudley greatly lessened his public influence. A few years later he was made a D.D. by the University of Glasgow, but tributes to his merits as divine, scholar, and author could not compensate for domestic unhappiness caused by various deaths and by the dissolute conduct of one of his sons. His second wife dying in 1713, he took another two years later and suffered greatly in consequence of her derangement. In 1721 by his bold stand in favor of inoculation for smallpox he aroused a storm of opposition to himself. Then came his father's death, a final disappointment with regard to the presidency of Harvard, and his own death, Feb. 13, 1728.

Cotton Mather was a man of extraordinary learning, a staunch upholder of antiquity, especially in matters of theology and Church polity, a marvelously voluminous writer, an active politician, and, when not misled by excitement, a public-spirited citizen. His connection with the persecution of the witches has given him a sinister reputation, which no efforts of biographers have been able to efface; but it is certain that he was sincere in his beliefs, and not thoughtlessly cruel; and he is better remembered than any other of the early colonial divines. Few persons can now find time to read his numerous books, but no student of the period during which he lived should speak of him without gratitude. His *Magnalia* is full of errors, yet gives the very "form and presence" of its age and represents labors truly heroic. The most important of his works are: *Poem to the Memory of Urian Oakes* (1682); *Wonders of the Invisible World* (1693); reprinted in "Library of Old Authors," 1862); *Magnalia Christi Americana* (1702; reprinted in

two volumes, 1820 and 1853); *Bonifacius*, etc., or, as it is better known, *Essays to Do Good* (1710; Glasgow, 1838); *Parentator* (Boston, 1724), a curious and interesting life of his father, Increase. His *Diary* (c.1687-1708) was published in 1911 by the Massachusetts Historical Society. Consult: for his life and writings the biography by his son, Samuel Mather (Boston, 1729); Enoch Pond, *The Mather Family* (ib., 1844); M. C. Tyler, *History of American Literature*, vol. ii (New York, 1881); Barrett Wendell, *Cotton Mather* (ib., 1891); A. B. Marvin, *Life and Times of Cotton Mather* (Boston, 1892); Barrett Wendell, *Literary History of America* (New York, 1900); also G. L. Kittredge, "Some Lost Works of Cotton Mather," in *Massachusetts Historical Society, Proceedings*, vol. xlv (Cambridge, 1912), and J. P. Quincy, "Cotton Mather and the Supernormal in New England," in the same, series 2, vol. xx (ib., 1907).—Cotton Mather's son, SAMUEL (1706-85), graduated at Harvard in 1723, served as minister of the North Church, Boston, until 1742, and then, in consequence of differences concerning revivals, a separate church was formed for him in North Bennett Street. He published among other works a *Life of Cotton Mather* (1729); *An Apology for the Libertie of the Churches in New England* (1738); *America Known to the Ancients* (1773).

MATHER, FRANK JEWETT, JR. (1868-). An American art critic and professor. He was born at Deep River, Conn., and graduated from Williams College in 1889 and from Johns Hopkins University (Ph.D.) in 1892; he studied also at Berlin and at the Ecole des Hautes Etudes, Paris. From 1893 to 1900 he served as instructor and assistant professor of English and Romance languages at Williams College, and thereafter was professor of art and archaeology at Princeton. He was an editorial writer for the *New York Evening Post* and assistant editor of the *Nation* (1901-1906) and art critic for the *Post* (1905-06; 1910-11); from 1904 to 1906 was American editor of the *Burlington Magazine*; contributed frequently, chiefly on art subjects, to the *Nation*, the *Burlington Magazine*, *Art and Progress*, and other periodicals; and published *Homer Martin, Poet in Landscape* (1912), and a volume of short stories, *The Collectors* (1912).

MATHER, INCREASE (1639-1723). A colonial divine, youngest son of Richard Mather (q.v.). He was born at Dorchester, Mass., June 21, 1639. A precocious boy, he entered Harvard at 12 and graduated at 17. On his nineteenth birthday he preached an able sermon from his father's pulpit. Shortly afterward, at the request of his brothers, Samuel and Nathaniel, he went to Dublin, where, at Trinity College, he took his M.A. Then he preached in Devonshire and Guernsey with success, but returned to Massachusetts in 1661. For some time he divided his services between his father's church at Dorchester and the new North Church at Boston, but in 1664 he threw in his lot with the latter.

In 1681, on the death of Urian Oakes (q.v.), Mather was appointed his successor as president of Harvard, and began his duties, but his church would not let him go. In 1685, after the death of President John Rogers, he was enabled to accept the post on the condition that he should still reside in Boston. He held it until 1701, the college growing under his care, but suffering

from various dissensions. Mather objected to leaving Boston for the rural obscurity of Cambridge, but was finally forced to reside at the college, and soon after gave up the post, which had been rendered most uncomfortable to him. Meanwhile he had made himself useful to the colony by resisting the attempts of Charles II to seize the charter of Massachusetts, had patriotically opposed the tyranny of James II, and in 1688 had gone to England as agent for his fellow citizens. He could not secure from William III the restoration of the old charter, but he obtained a new and fairly satisfactory one, and gained the favor both of the King and of the people of the colony. Fortunately for him, he was absent in England during the worst of the witchcraft delusion, in which his son Cotton took a prominent part. It is plain, however, that after this excitement wore off the hold of Mather and his son Cotton upon the clergy and people of the colony was greatly weakened. He maintained his personal vigor to a considerable extent, until his death, Aug. 23, 1723. Chief among his works are: *A Brief History of the War with the Indians in New England* (1676; edited by Drake, 1862); *A Relation of Troubles of New England from the Indians* (1677; edited by Drake, 1864); *Cometographia, or a Discourse Concerning Comets* (1683); and best known and most interesting probably, *An Essay for the Recording of Illustrious Providences* (1684; reprinted in the "Library of Old Authors," 1856). The last-named book is usually known as *Remarkable Providences* and is a mine for those interested in seventeenth-century superstitions. His *Cases of Conscience Concerning Witchcraft* (1693; reprinted with Cotton Mather's *Wonders of the Invisible World* in the "Library of Old Authors," 1862) is interesting and important. For Increase Mather's life, consult: Cotton Mather's biography of him entitled *Parentator* (Boston, 1724); Enoch Pond, *The Mather Family* (ib., 1844); Barrett Wendell, *Cotton Mather* (New York, 1891); A. B. Marvin, *Life and Times of Cotton Mather* (Boston, 1892); also: M. C. Tyler, *History of American Literature*, vol. ii (New York, 1881), and Williston Walker, *Ten New England Leaders* (ib., 1901). For a list of his voluminous writings, consult Sibley, *Harvard Graduates*, vol. i (Cambridge, 1873).

MATHER, RICHARD (1596-1669). A colonial divine and founder of the famous Mather family in New England. He was born in Lowton, Lancashire, of a family of Puritan yeomen. He began giving religious teaching when a mere boy, then passed through Brasenose College, Oxford, and about 1619 was ordained and put in charge of the church at Toxteth, near Liverpool. In 1635 he emigrated to Massachusetts. As he was noted for his learning and his powerful preaching, there was rivalry among the New England churches to secure him. He finally settled at Dorchester in 1636, and remained there as pastor until his death, April 22, 1669. He wrote public letters on matters of Church government, helped to compile the *Bay Psalm Book* (q.v.), and had a leading share in framing the Cambridge Platform (1648). (See CONGREGATIONALISM.) He transmitted his powers, especially his love of reading and writing books, to his six sons by his first wife, Katharine Holt; his second marriage with the widow of the famous John Cotton (q.v.) proved childless. Four of these sons became somewhat famous

as preachers and authors. Of these the best known is the youngest, INCREASE MATHER (q.v.).—The eldest, SAMUEL (1626-71), began preaching in Boston, soon removed to England, where he was very popular, and, after the ejection of the Nonconformists in 1662, became a leading clergyman of Dublin.—The third son, NATHANIEL (1631-97), also attained reputation in England as a preacher and religious writer, and succeeded his brother Samuel in Dublin.—The fifth son, ELEAZER (1637-69), was the first minister at Northampton, Mass. For sketches of Richard Mather, consult: Increase Mather, *Life and Death of Richard Mather* (Cambridge, Mass., 1670); Cotton Mather, *Parentator* (Boston, 1724); M. C. Tyler, *History of American Literature*, vol. ii (New York, 1881); Barrett Wendell, *Cotton Mather* (ib., 1891).

MATHER, ROBERT (1859-1911). An American lawyer and railroad official, born in Salt Lake City. He graduated from Knox College (Illinois) in 1882, and in 1886 was admitted to the Illinois bar at Chicago, where he practiced for three years. He was local attorney (1889-94), assistant general attorney (1894), general attorney (1894-1902), and general counsel (1902-09) of the Chicago, Rock Island, and Pacific Railway Company. In 1904-09 he served as president of the Rock Island Railway Company, and thenceforth was chairman of the board of directors of the Westinghouse Electric and Manufacturing Company which he reorganized. He was an officer and director in other important financial, railroad, and industrial concerns.

MATHER, THOMAS (1856-). An English electrical engineer, born at Higher Walton, near Preston. Educated at Owens College, Manchester, and at the Normal School of Science, London, he became a fellow of the Royal Society in 1902 and professor of electrical engineering at the City and Guilds College, South Kensington, in 1909. He assisted in determining the exact value of the electrical units and improved practical instruments for measuring electricity and universal shunts. On these subjects he wrote many papers for the Physical Society of London (of which he was vice president), for the Royal Society, and for the Institution of Electrical Engineers. He published *Exercises in Electrical Engineering* (1910), with Howe, and *Practical Electricity* (1911), with Ayrton, whose assistant he was for many years.

MATHER, SIR WILLIAM (1838-). An English engineer and promoter of technical and industrial education. He was born in Manchester, was educated in Germany, and rose to be chairman of the engineering firm of Mather and Platt, Ltd., of Manchester. In 1883 Mather made a study of technical education in America and Russia for the Royal Commission on Technical Instruction; in 1908 he was chairman of the British education section of the Franco-British Exhibition; and he became chairman of the Fröbel Educational Institute, London. Between 1885 and 1904, though not continuously, he represented various Lancashire divisions in Parliament in the Liberal interests. In 1902 he was knighted and honorary degrees were given him by Princeton and Manchester universities.

MATHER, WILLIAM WILLIAMS (1804-59). An American geologist, born at Brooklyn, Conn. He was educated for the military profession and graduated in 1828 at West Point, where he was assistant professor of chemistry, mineralogy, and

geology from 1829 to 1835. He resigned from the army in 1836 in order to devote himself to physical science, and became professor of chemistry at the University of Louisiana, from which position he retired in a few months to superintend the geological survey of the first district of New York State, including the counties bordering upon the Hudson River. While engaged in these researches (1836-44) he was State geologist for Ohio (1837-40) and Kentucky (1838-39), and professor of natural science, vice president, and acting president at the Ohio University at Athens (1842-50). By experiments made at Athens (1845) he discovered that bromine, which at that time was selling at \$16 an ounce, could be obtained at a comparatively small price from the bitter waters of the salt works near that place. Mather collected a cabinet of over 22,000 mineralogical specimens. He was State agricultural chemist for Ohio (1850-54), edited the *Western Agriculturalist*, and was the author of the "Geology of the First Geological District," in *Natural History of New York* (1843), and of *Elements of Geology*.

MATHERS, mǎth'ers, HELEN BUCKINGHAM. See REEVES, MRS. HENRY.

MATHESON, mǎth'e-son, ARTHUR JAMES (1842-1913). A Canadian statesman. He was born at Perth, Ontario, and was educated at Upper Canada College and at Trinity College, Toronto. He was called to the bar in 1870 and practiced his profession in Perth, where he also entered municipal life and became mayor (1883-84). He was a Conservative member of the Ontario Legislature in 1894-1913 and was Provincial Treasurer in 1905-13 in the administration of Sir James P. Whitney (q.v.). He was a member of the Ottawa Interprovincial Conference (1906), of the National Conference on State and Local Taxation (1907), and vice president for Canada of the International Commission (1910). In 1908 he was made king's counsel. He entered the militia in 1866, served on the frontier during the Fenian raids (1866-70), winning promotion, and was made lieutenant colonel in 1886 and brigadier general in 1900.

MATHESON, GEORGE (1842-1906). A Scottish minister and author, born in Glasgow. He lost his eyesight in his youth, but entered the University of Edinburgh and graduated with honours in 1861. His first charge was at Innellan, Argyllshire (1868-86); afterward he became minister at St. Bernard's, Edinburgh (1886-99). He was author of the hymn "O Love that Wilt Not Let me Go." His publications include: *Aids to the Study of German Theology* (1873; 3d ed., 1876); *The Growth of the Spirit of Christianity* (2 vols., 1877); *Natural Elements of Revealed Theology* (1881); *My Aspirations* (1883); *Can the Old Faith Live with the New?* (1885); *Distinctive Messages of the Old Religion* (1893); *Bible Definition of Religion* (1898); *Studies of the Portrait of Christ* (2 vols., 1899-1900); *The Representative Men of the Bible* (1902); *Leaves for Quiet Hours* (1904); *The Representative Women of the Bible* (1907). Consult his *Life* by D. Macmillan (London, 1907; new ed., New York, 1911).

MATHESON, SAMUEL PRITCHARD (1852-). A Canadian Anglican prelate, born at Kildonan, Manitoba, and educated at St. John's College, Winnipeg. Ordained a priest of the Church of England in Canada in 1876, he was appointed canon of St. John's Cathedral, Winni-

peg, in 1882; dean of Rupert's Land and prolocutor of the General Synod of Canada in 1902; and was consecrated Coadjutor Bishop of Rupert's Land in 1903. He was elected Bishop of Rupert's Land and Metropolitan, with the title of Archbishop, in 1905 and Primate of all Canada in 1909. Successively he served as professor of exegetical theology in, and warden and chancellor of, St. John's College, Winnipeg. He was elected honorary president of the Moral and Social Reform Council of Canada; was a delegate to the Pan-Anglican Congress, London, England (1908); and a delegate to, and honorary president of, the Anglican Church Congress, Halifax (1910).

MATHEW, mǎth'ū, THEOBALD, commonly known as FATHER MATHEW (1790-1856). A total-abstinence orator. He was born at Thomastown, a few miles east of Tipperary Castle, in Ireland, Oct. 10, 1790. On the death of his father, while Mathew was still very young, the kindness of the Llandaff family enabled the boy to enter the Roman Catholic College of Kilkenny, whence he was transferred, as a candidate for the Roman Catholic priesthood, to the College of Maynooth in 1807. He left that college, however, in the next year. He relinquished the secular priesthood for that of the religious Order of the Capuchins, in which he took priest's orders in 1814 and, after a year in Kilkenny, was sent to the church of his order in the city of Cork, where he remained for 24 years. He established a religious brotherhood similar to that of St. Vincent de Paul, and he founded schools for children of both sexes. But the great work of Father Mathew's life is the marvelous reformation which he effected in the habits of his fellow countrymen and which has won for him the title of Apostle of Temperance. In 1838 he established an association on the principle of total abstinence, at first confined to the city of Cork, but afterward extending to the county and adjacent districts of Limerick and Kerry. The success which attended this first local effort led to the suggestion that Father Mathew himself should repair to the several great centres of population, especially in the south. Thence he gradually extended the field of his labors to Dublin, to the north, and even to Liverpool, Manchester, London, Glasgow, and the other chief seats of the Irish population, even in the New World. His association included a large proportion of the adult population of Ireland, without distinction of rank, creed, or sex; and so complete was the revolution in the habits of the Irish people that very many distilleries and breweries ceased from working. Mathew's munificent charities, especially during the Irish famine of 1846-47, the expenses connected with his total-abstinence association, and perhaps his own unworldly habits, involved him in pecuniary embarrassments and embittered his last years. A pension of £300, granted by the crown in 1847, was supplemented by private subscription and relieved him of his liabilities. In 1848 he had an attack of paralysis, from which he never fully recovered. From 1849 to 1851 he was in America and founded numerous total-abstinence societies. He died at Queenstown, Ireland, Dec. 8, 1856. Consult his *Life* by J. F. Maguire (London, 1869; abridged, 1890), by F. I. Mathew (ib., 1890), and by Tynan (ib., 1908).

MATHEWS, mǎth'ūz, CHARLES (1776-1835). An English comedian, born in London on June 28, 1776. He was the son of a bookseller, who

intended his son to follow the same vocation; but Charles's early inclination for the stage overcame parental counsel, and he made his appearance as an amateur, in the part of Richard III, at the Richmond Theatre in 1793. As a professional comedian, he appeared in the Theatre Royal, Dublin, the following year. In 1803 he made his first appearance in London at the Haymarket, playing the part of Jabel in *The Jew* by Cumberland. In 1818 he first introduced in London one of his entertainments, known as *At Homes*, such as he repeated for a number of subsequent seasons with immense success. In the course of his career he twice visited America, in 1822 and 1834, and his last appearance upon the stage was made at New York in February, 1835. He had been since 1828 a joint proprietor of the Adelphi Theatre of London. His death occurred at Plymouth on June 28, 1835. Mathews was a wonderful master of impersonation and mimicry. The variety of his facial expression was so extraordinary that he could alter his curious features in an instant and deceive even his friends as to his identity, a peculiarity of which many quaint stories are told. He was extremely sensitive, and the fineness of his taste and character, as well as his wit, made him a welcome companion of the most distinguished people. Charles James Matthews (q.v.), his son (1803-78), became even better known as an actor than his father. Consult: Mrs. Mathews, *Memoirs of Charles Mathews, Comedian* (London, 1838-39); id., *Anecdotes of Actors* (ib., 1844); Baker, *Our Old Actors* (ib., 1881); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States*, vol. ii (New York, 1886).

MATHEWS, CHARLES JAMES (1803-78). An English actor and playwright, son of Charles Mathews, born in Liverpool, Dec. 26, 1803. He was educated at Merchant Taylors' School and at a school at Clapham kept by Richardson the lexicographer. In 1819 he began study with Pugin, the architect. With Pugin he went to Paris, whose comedians increased a lurking disposition of his to appear on the stage. He did so as an amateur in April, 1822, playing the part of Dorival in *Le comédien d'Etampes* at the Lyceum Theatre. He afterward designed and superintended the building of cottages, inns, and bridges. In 1835 he gave up his profession and turned to the stage. Though a brilliant actor in light pieces, he met with many reverses as manager. During his long career on the stage he played, in England and America, more than 200 rôles in dramas written by himself and others. Among his most famous parts were Charles Coldstream in *Used Up*, Lavater in *Cool as a Cucumber*, and Puff in the *Critic*. Besides performing at the principal London theatres, Mathews made tours through Canada, the United States, and Australia. He died at Manchester, England, June 24, 1878. Consult Charles Dickens, *Life of C. J. Mathews* (London, 1879).

MATHEWS, EDWARD BENNETT (1869-). An American mineralogist, brother of Shailer Mathews (q.v.). He was born at Portland, Me., and graduated in 1891 from Colby College and in 1894 (Ph.D.) from Johns Hopkins, where he was instructor in mineralogy and petrography (1894-95), associate (1895-99), associate professor (1899-1904), and professor after 1904. He was also a field assistant of the United States Geological Survey in 1891-94, and in 1898 became State geologist of Maryland. His writings include: *Bibliography and Cartography of Mary-*

land (1897); *The Maps and Map-Makers of Maryland* (1898); *An Account of the Character and Distribution of the Maryland Building Stones* (1898); *The Counties of Maryland, their Origin, Boundaries, and Election Districts* (1907); *The Limestones of Maryland* (1910).

MATHEWS, JOSEPH McDOWELL (1847-). An American surgeon, born at Newcastle, Ky., and educated professionally at the University of Louisville (M.D., 1867). He established himself in practice at Louisville and became professor of surgery in the Louisville Hospital College of Medicine. In 1899-1900 he served as president of the American Medical Association. He is the author of *Diseases of the Rectum, Anus, and Sigmoid Flexure* (1893; 3d ed., 1903) and of *How to Succeed in the Practice of Medicine* (1902).

MATHEWS, SHAILER (1863-). An American New Testament scholar, editor, and author. Born at Portland, Me., a brother of Edward Bennett Mathews (q.v.), he was educated at Colby College (A.B., 1884; A.M., 1887), and graduated from the Newton Theological Institution in 1887. He returned to Colby to be associate professor of rhetoric (1887-89) and professor of history and political economy (1889-94). In 1890-91 he studied at Berlin. At the University of Chicago he was associate professor (1894-97) and professor (1897-1905) of New Testament history and interpretation, professor of systematic theology (1905-06), professor of historical and comparative theology after 1906, also junior dean of the Divinity School (1899-1908), and dean after 1908. He was president of the Western Economic Society after 1911 and of the Federal Council of the Churches of Christ in America after 1912, and served as editor of *The World Today* in 1903-11 and of the *Biblical World* after 1913. His publications include: *Select Medieval Documents* (1892; 2d ed., 1900); *The Social Teaching of Jesus* (1897; rev. ed., 1908); *A History of New Testament Times in Palestine* (1899; rev. ed., 1910); an excellent study of *The French Revolution* (1901; 4th ed., 1904); *The Messianic Hope in the New Testament* (1905); *The Church and the Changing Order* (1907); *The Social Gospel* (1910); *The Gospel and the Modern Man* (1910); *Scientific Management in the Churches* (1912); *The Making of To-Morrow* (1913).

MATHEWS, WILLIAM (1818-1909). An American author, born at Waterville, Me. He graduated at Waterville College (Colby College) in 1835, studied law at Harvard, and was admitted to the bar. In 1841 he established the *Watervillonian*, afterward called the *Yankee Blade*, which united with the *Boston Portfolio* in 1856. He was also in newspaper work in Chicago from 1859 until 1862, when he was appointed professor of rhetoric and English in the University of Chicago, a position he resigned in 1875. His publications include: *Getting On in the World* (1872); *The Great Conversers, and Other Essays* (1874); *Words: Their Use and Abuse* (1876); *Hours with Men and Books* (1877); *Oratory and Orators* (1879); *Literary Style* (1881); *Men, Places, and Things* (1887); *Wit and Humor: Their Use and Abuse* (1888); *Nugæ Literariæ* (1896); *Conquering Success* (1903).

MATHEWS, WILLIAM SMYTHE BABCOCK (1837-1912). An American musician and writer on music. He was born in Loudon, N. H., and was educated entirely under American teachers.

From 1891 to 1902 he was the editor of *Music*, a journal devoted to the interests of students of music. For many years this paper was an important influence in the musical life of America, but gradually it lost its prestige through over-conservatism and increasing opposition to the music of Wagner. His publications include: *Outlines of Musical Form* (1867); *Emerson Organ Method* (1870), in collaboration with L. O. Emerson; *Pianoforte Technics* (1876), with William Mason; *How to Understand Music* (2 vols., 1880, 1888, respectively); *Popular History of Music* (1889); *One Hundred Years of Music in America* (1889); *Pronouncing Dictionary of Musical Terms* (1896), with Emil Liebling; *Music: Its Ideals and Methods* (1897).

MATHIAS, mā-thi'as, THOMAS JAMES (c.1754-1835). An English author. He was educated at Trinity College, Cambridge, of which he became a fellow, and was appointed treasurer of the household to Queen Charlotte. This office he resigned in 1818 and passed the later part of his life at Naples. During his long residence in Italy he became thoroughly acquainted with its language and literature and wrote Italian verses with considerable fluency. But his principal service to Italian literature was his edition of Tiraboschi's standard work, *The History of Italian Poetry* (1805). His best work is *The Pursuits of Literature*, a poem which was published anonymously between 1794 and 1797. The chief interest of the *Pursuits* lies in its satirical critical notes, which made a sensation at the time.

MATICO, mā-tē'kō (Sp., from South American name). *Piper angustifolium* or formerly known as *Artanthe elongata*. A shrub of the family Piperaceae, a native of Peru, where it is known as soldiers' herb, because its hairy leaves are used as a styptic. The name is also applied to a species of *Eupatorium* (q.v.).

MATICO. A South American armadillo (q.v.) (*Tolypeutes conurus*), allied to the apar.

MATILDA. A town in Ontario, Canada. See IROQUOIS.

MATILDA (1102-67). Daughter of Henry I, King of England, and wife of the Emperor Henry V, often known as the Empress Maud. After her husband's death in 1125 she returned to England, and in 1126 her father compelled the barons of the realm to swear that they would accept her as his heir. In 1128 she was married to Geoffrey Plantagenet, son of the Count of Anjou. In 1133 she gave birth to a son, who was to ascend the throne of England as Henry II. When Henry I died in 1135, Matilda immediately claimed all his possessions, but was opposed by her cousin Stephen of Blois. In Normandy she was successful, but in England Stephen was generally accepted as King, though Matilda was loyally supported by her half brother Robert of Gloucester. In 1141 she was for a time victorious; Stephen was captured and even his brother Henry, Bishop of Winchester and Papal Legate, submitted to her rule. But the nobles of England found her too haughty and rose against her authority, and her cause was hopelessly lost until Henry was old enough to participate in the contest. After Henry II came to the throne she used her influence with the King for the preservation of peace in the Kingdom and sought to be mediator between him and Becket (q.v.). Consult J. H. Round, *Geoffrey de Mandeville: A Study of the Anarchy* (London, 1892).

MATILDA (1046-1115). Countess of Tus-

cany, noted through her close connection with the Papacy during its struggle with the Emperor Henry IV. She was a daughter of Boniface II, Count of Tuscany, and Beatrice of Lorraine. In 1070 she married by procuracy Godfrey (surnamed *Il Gobbo*, i.e., "the Hunchback"), Duke of Lorraine. Her husband did not join her until 1072, and died in 1076. After this Matilda made herself conspicuous by the zeal with which she espoused the cause of Gregory VII, and it was at her castle of Canossa that Henry IV in 1077 made his humiliating submission to the Pope. In 1089, though 43 years of age, she contracted a nominal marriage with the 18-year-old Welf, the son of Welf, Duke of Bavaria, in order to gain additional support for Gregory's successor, Urban II, but the marriage was dissolved in 1095. When she died (July 24, 1115), the Papacy claimed her extensive territories, comprising Tuscany, Brescia, Modena, Reggio, Mantua, and Ferrara, on the ground that in 1077 she had made the Church her heir. This produced a new conflict between Papacy and Empire. In the course of this contest the cities rose to great power and asserted their independence. Consult: Luigi Tosti, *La contessa Matildâ ed i romani pontifici* (2d ed., Rome, 1886); Overmann, *Gräfin Mathilde von Tuscien: Ihre Besitzungen. Geschichte ihres Gutes von 1115-1320 und ihre Regesten* (Innsbruck, 1895); M. E. Huddy, *Matilda, Countess of Tuscany* (St. Louis, 1905); Nora Duff, *Matilda of Tuscany* (London, 1910).

MATILDA CASE. See CHASE, S. P.

MATILE, mā-tel', GEORGE AUGUSTE (1807-81). A Swiss-American jurist, born at La Chaux-de-Fonds (Neuchâtel). He studied law at Berlin and Heidelberg, and still later in Paris. He was admitted to the bar (1838) at Neuchâtel, and eight years afterward was appointed professor of law at the university there, and judge of the Supreme Court. He came to America in 1849, and in 1856 was made professor of history at Princeton. In 1858 he removed to the University of Pennsylvania as professor of French literature. From 1863 until his death he was connected with the State Department in Washington. His works include: *Points de coutume* (1838); *Autorité du droit romain de la coutume de Bourgogne et de la Caroline dans la principauté de Neuchâtel* (1838); *Musée historique de Neuchâtel* (1841-59); *Monuments de l'histoire de Neuchâtel* (1844-48); *Histoire de la seigneurie de Valangin* (1852).

MÂTIN, mā'tān' (OF. *masin*, *mâtin*, from ML. **manusuetinus*, from *mansuetare*, to tame, from *mansuetus*, p.p. of *mansuescere*, to tame, from *manus*, hand + *suescere*, to become accustomed, inchoative of *suere*, to be accustomed). A large kind of dog, now almost peculiarly French, but allied to the Great Dane. It has rough hair, a rather flat forehead, a rather pointed muzzle; the ears are erect, but bent down at the tips. It is generally of a whitish color, clouded with brown. It is fierce, but not very courageous. Compare HOUND.

MA'TINS. See CANONICAL HOURS; BREVIARY.

MATISSE, mā'tēs', HENRI (1869-). A French painter and sculptor, chief leader of the movement known as Post Impressionism (q.v.). He was born at Cateau (Nord), and studied at the Ecole des Beaux-Arts, Paris. For four years (1795-99) he painted in the conventional style; then, coming under the influence of Cézanne, he launched a new school. Rejecting all art of the

past, and especially the use of nature as a standard of beauty, Matisse attempts a return to primitive, childlike art, without reference to the conventional or the natural appearance of objects. "Simplification, organization, expression"—these are the oft-quoted watchwords of his manner; they perhaps explain his method. He possesses abundant vitality, is a capable draftsman, and has a keen sense of the decorative; but to the uninitiated or to those who have a different idea of what may be called art, his work seems grotesque, purposely defective, and therefore insincere. His peculiar style can best be studied in the Stein collection, Paris. Matisse was well represented in the International Exhibition of Modern Art, New York, in 1913, especially by paintings. Among some of the much discussed examples of his work in this kind are the decorative panels "Dance" and "Music," "The Woman with the Green Eyes," and a portrait of himself. A representative and retrospective exhibition of drawings, lithographs, paintings, and sculpture was held at the Montross Galleries, New York, in February, 1915. Among the most notable of the sculptures were the powerful "Serf"; nude women in various postures; and four versions of a "Woman's Head." The paintings included the well-known "Cocous," "Nude Model Posing," "Gold Fish," and "Young Sailor." Consult: Fritz Burger, "Henri Matisse," in *Cézanne und Hodler: Einführung in die Probleme der Malerei der Gegenwart*, vol. i (Munich, 1913); J. G. Huneker, "Matisse, Picasso and Others," in *The Pathos of Distance* (New York, 1913).

MATLOCK. A town of Derbyshire, England, situated amid beautiful scenery, 17 miles northwest of Derby. It is noted for its fine scenery, hot mineral springs, baths, and stalactite caves. Manufactures include cotton and bleach goods and paper; there are lead mines near by. Pop., 1901, 5980; 1911, 6745.

MATOS FRAGOSO, mā'tōsh frā-gō'só, JUAN DE (?1614-1689). A Spanish-Portuguese dramatist, born at Alvito (Alemtejo), Portugal, about 1614. After becoming licentiate in the humanities and jurisprudence at Évora, he went to Madrid, became intimate with Pérez de Montalbán, and thus obtained a hearing on the stage. His earliest play known to us, *La defensa de la fé y príncipe prodigioso*, was published in 1651, and a dozen more appeared in 1658. Despite his popularity and his insistence upon the "point of honor," he is no longer read. Seven of his plays appear in vol. xlvii of the *Biblioteca de autores españoles*.

MA'TRIAR/CHATE (from Lat. *mater*, Gk. μήτηρ, *mētēr*, mother + ἀρχός, *archos*, ruler, from ἀρχεῖν, *archein*, to rule). Any social group, as a family, a clan, or a tribe, ruled by a woman or by women. The term has been used in ethnology since the publication in 1865 of Bachofen's *Das Mutterrecht*, in which it was shown that in all races there exist survivals of a metronymic period when children took the mother's name, instead of the father's name, and when property also descended in the female line. Such a system is still in full force among the North American Indians, and has been carefully described by Morgan in his *League of the Iroquois* in 1849. As an existing system it may even now be observed among the Damaras of South Africa, the Congo tribes of West Africa, the inland negroes, the Kasias of Bengal, the Tahitians and Tongans of Polynesia, and the

Hovas of Madagascar. This system, however, is in fact only metronymic, and everywhere falls short of being matriarchal. There is no proof that mankind has passed through a stage of clan or tribal rule by women, although in his account of the Iroquois Long House Morgan presents a picture of a rigorous control of domestic affairs by a matron. Moreover, in the Iroquois clan a position of importance and respect was accorded to women. They voted in the council of the clan, on equal terms with men. In various African and Polynesian tribes women have held the most exalted position, that of queen of a tribal confederacy. This, however, was no such "matriarchy" as was at one time imagined by ethnologists disposed to believe that a patriarchal system had been preceded by one in which woman's relative importance was as great as that of man at a later time became. More complete investigations have shown that under metronymic organization it is not the wife and mother who exercises an authority over children which the husband does not possess. The authority really lies in the hands of the woman's nearest male kinsman, that is, her brothers, or her maternal uncles. These male kinsmen even exercise authority over husbands who have come to live among them. Consult: Dargun, *Mutterrecht und Raubehe* (Breslau, 1883); J. J. Bachofen, *Das Mutterrecht* (2d ed., Basel, 1897); E. A. Westermarck, *History of Human Marriage* (3d ed., ib., 1902); Charles Letourneau, *Evolution of Marriage* (ib., 1911).

MATRICARIA. See CHAMOMILE.

MATRICULA'TION (from ML. *matriculare*, to enroll, from Lat. *matricula*, register, diminutive of *matrīx*, roll, origin, womb, from *mater*, mother). A term denoting in a general sense enrollment or admission to membership in any body or society, specifically in a college or university.

MATRIMONIO SEGRETO, mā'trê-mō'nê-ô sâ-grâ'tô, IL (It., The Secret Marriage). An opera bouffe by Cimarosa, first produced in Vienna, Feb. 7, 1792; in the United States, Jan. 4, 1834 (New York).

MA'TRIX, IN MATHEMATICS. See DETERMINANTS.

MA'TRONA. See MARNE.

MATRONA'LIA (Lat., neu. pl. of *matronalis*, relating to a matron). A festival of Juno Lucina (see JUNO), celebrated at Rome by the married women and maidens of the city on the first of March. It typified the sacredness of married life and commemorated the dedication of the temple of Juno on the Esquiline, to which in the festival the matrons marched in procession with offerings for the goddess. Consult W. W. Fowler, *Roman Festivals* (London, 1899).

MATRONS, JURY OF. In English legal procedure, an extraordinary jury, composed of "matrons or other discreet women," impaneled under special circumstances to determine whether a woman is quick with child—the only instance in which women were eligible to serve as jurors at common law. It may be employed both in civil and in criminal cases where the fact of pregnancy is in issue or where a legal right turns upon the fact. In civil cases the question may arise in suits for the annulment of marriage on the ground of the concealed pregnancy of the wife resulting from an illicit connection with another man than her husband before marriage, in cases of pedigree where there

is need of a safeguard against the fraud of a supposititious child and the like. The writ *de ventre inspiciendo*, as it is called, is issued by the Court of Chancery to the sheriff and directs him to summon a jury of women to investigate and report whether the woman named in the writ is with child or not and, if so, at about what date her delivery may be looked for. The procedure is of very ancient origin and is said to have been borrowed from the civil law of Rome. It was frequently employed in the Middle Ages and there are several instances of its use in the last century as late as 1845. Though it has not been employed since that date it is still available as a matter of right if demanded. The fact that modern medicine furnishes a surer method of ascertaining the existence of pregnancy, has, in practice, led to the practical abandonment of the jury of matrons in such cases.

In criminal cases the jury of matrons was obligatory and directed by the court on the demand of a woman convicted of felony that execution of the sentence be suspended until she had given birth to a child of which she claimed to be pregnant. The common law from motives of humanity, and in order that a child which had quickened in the womb should not also lose its life for the mother's crime, provided for the postponement of the death penalty till the child had been safely delivered. The woman was entitled as matter of right after sentence to plead her pregnancy in answer to the question, "What have you to say for yourself in stay of the execution of the sentence which has been given against you?" The course usually followed is for the clerk, immediately upon the plea being made, to impanel a jury of 12 from the women present in court. The jury then retire with the prisoner to make the necessary examination and for this purpose may have the assistance of a competent physician. They may also hear the testimony of medical men offered either in the interests of the prisoner or of the crown and given in open court. In order that the verdict of the jury shall operate as a reprieve it is not sufficient that the bare fact of pregnancy be found. The verdict must declare that the prisoner is "with quick child." As in civil cases the modern tendency is to employ a medical examination in all cases of alleged pregnancy, and in New York and several other States the jury of matrons has been abolished by statute and a jury of medical men (usually six) substituted in their stead. This is also the French procedure. In England, however, the old practice of summoning a jury of matrons in such cases still obtains. The last instance of its use appears to have been in the case of *Regina v. Katherine Webster*, in 1879, reported in the *Times*, July 9, 1879. Consult: J. F. Stephen, *History of the Criminal Law* (London, 1883); Sir William Blackstone, *Commentaries on the Laws of England* (4th ed., Chicago, 1899); Edward Chitty, *Criminal Law* (4 vols., London, 1816); Taylor, *Medical Jurisprudence* (5th ed., ib., 1905); *Encyclopedia of the Laws of England*, vol. ix (2d ed., ib., 1907). See PREGNANCY.

MATSUE. See MATSUYE.

MATSUKATA, măt'sōō-kă'tă, MASAYOSHI, MARQUIS (1835-). A Japanese statesman, born in Satsuma, the son of a samurai. After the revolution he became head of one of the new prefectures and took a prominent part in the

tax reform of 1875. He became Minister of Commerce in 1880, of Finance in 1881, and cabinet president with the portfolio of Finance in 1891. He retired in 1893, but in 1896 formed a new cabinet, became Minister of Finance, introduced the gold standard, which put Japanese credit on a firm basis, and retired in December, 1897, because of opposition to his programme of taxation. In 1898-1900 he was again Finance Minister. He was made Privy Councillor in 1903, and for some years was president of the Japan Red Cross Society. His title of Marquis he held after 1906, having previously been Count since 1884.

MATSUMAI, măt'sōō'mă, or **MATSUMAYE**, măt'sōō-mă'yě. A seaport of Japan. See FUKUYAMA.

MATSUMOTO, măt'sōō-mō'tō. A town of Japan in the District of Nagano, situated nearly in the centre of the island of Hondo, 100 miles northwest of Tokyo (Map: Japan, E 5). It lies in a wide fertile plain surrounded by mountains, and contains a picturesque remnant of an old daimyo castle. It manufactures silks, baskets, and preserved fruits. Pop., 1903, 33,493; 1908, 35,011.

MATSUMURA, măt'sōō-mō'ră, NINZO (1856-). A Japanese botanist, born in Ibaraki-Ken, of a samurai family. He took a great interest in botany as a young man and after he was 30 studied in Würzburg and Heidelberg (1886-88). In 1883 he had been made assistant professor of botany in the University of Tokyo, and in 1890 became professor and in 1897 director of the Botanical Gardens. He assisted in the preparation of Brinkley's *Unabridged Japanese-English Dictionary* (1896), and he published many important works on the flora of Japan, including: *Nomenclature of Japanese Plants in Latin, Japanese, and Chinese* (1884), *Names of Plants and their Products in English, Japanese, and Chinese* (1892), *Conspectus of Leguminosae* (1902), *Index plantarum Japonicarum: Cryptogamae* (1904), *Phanerogamae* (1905); with Ito, *Tentamen Florae Lutchuensis* (1899) and *Revisio Alni Specierum Japonicarum* (1902); with Hayata, *Enumeratio Plantarum in Insula Formosa Sponte Crescentium* (1906).

MATSUNAGA, măt'sōō-nă'gă, RYŌHITSU. A prominent Japanese mathematician, born at Kurume in Kiushu, or possibly at Terauchi in Awari. He died in 1744. His former name was Terauchi Gompei, and he is also known as Matsunaga Yoshisuke. He received the mathematical secrets of the Seki (q.v.) school from Araki (died in 1718), under whom he studied. His best-known work, the *Hoyen Sankyo* (1739), is devoted entirely to formulas for the circumference and arcs of circles. In this he gives the value of π to 50 figures.

MATSUOKA, măt'sōō-ō'kă, YASUKOWA (or KOKI) (1846-). A Japanese statesman and administrator, born in Tokushima, Awa Province, of a samurai family. He entered the Department of Justice in 1871; traveled in Europe to study judicial methods in 1886-87; became a crown member of the House of Peers in 1891; was Procurator General in 1892 and Vice Minister of Home Affairs in 1894 and 1898; presided over the Administrative Litigation Court in 1898-1906; and in 1906-08 was Minister of Agriculture and Commerce. He was president of Japan University, a private institution. Matsuoka was a political adherent of Yamagata.

MATSUSHIMA, măt'sōō-shě'mă. A small

village on the Bay of Sendai, on the east coast of northern Hondo, Japan, of which, in a shallow lagoon, lies a group of 808 tiny islets and rocks (also called *Matsushima*, or Pine Islands), ranging in height from 30 to 300 feet, rising steeply out of the water and covered with pines and stunted brushwood, forming a beautiful natural garden. It is one of the "three natural wonders" of the coast; the other two are found at Miyadzu and Miyajima (qq.v.).

MATSUYAMA, māt'sōō-yā'mā. A town of Japan, capital of the District of Ehime and of the former Province of Iyo. It is situated in the western part of the island of Shikoku, 5 miles from its port, Mitsu, with which it is connected by a railroad (Map: Japan, C 7). It is chiefly noted for its large feudal castle, formerly the seat of a daimyo, which was one of the few preserved as specimens by the Imperial government when feudalism was abolished. Pop., 1903, 37,842; 1908, 44,166.

MATSUYE, māt'sōō-yā, or **MATSUE**, māt'sōō-ā. A town of Japan, capital of the District of Shimane and formerly of the Province of Idzumo. It is situated on a small inlet of the Sea of Japan, on the north coast of the great southwestern peninsula of the island of Hondo, 140 miles northwest of Kyoto (Map: Japan, C 6). It is a clean, prosperous city, with numerous temples, and is noted for the manufacture of paper and the polishing of agates. Pop., 1903, 35,081; 1908, 36,209.

MATSYS, māt'sis', **MASSYS**, **METSYS**, **MESSYS**, **QUINTEN** (c.1460-1530). One of the most eminent painters of the early Flemish school. According to the most critical modern opinion, his birthplace was not Antwerp, as was formerly supposed, but Louvain. Here he studied, probably under a pupil of Dierick Bouts, for his earliest works show the influence of that master. The charming traditions of his early life, how the smith of Louvain became a painter for love of a painter's daughter, etc., deserve no credence. He removed early to Antwerp, where he was enrolled in the painters' guild in 1491, passed most of his life, and died in 1530. In Matsys's art Flemish painting of the fifteenth century reached its culmination, but he is also the earliest representative of the new era of the sixteenth century, when the Italian influence began to make itself felt in the Netherlands. He was one of the first to give to the human figure marked prominence and to understand the value of gesture and of unity of composition. Rejecting the miniature forms of his predecessors, he painted the figures life size, and subordinated detail to the general effect. His color is rich, but good in values, and subordinated to a luminous silvery tone. Among his earlier paintings are a series of "Crucifixions," the best being in the Liechtenstein Gallery, Vienna, and the Mayer van der Bergh collection, Antwerp, and a "Pietà" in the Louvre.

One of his greatest surviving works is the altarpiece for St. Ann's chapel in the church of St. Peter at Louvain, now in the Brussels Museum, completed in 1509. The subject of the centre panel is the "Family of St. Ann." The figures are nobly and solidly represented, but without dramatic expression. On the other hand, the scenes from the "Life of St. Ann" on the wings of the altar are strongly dramatic. His masterpiece is the great triptych in the Antwerp Museum, representing the "Burial of Christ," flanked by the "Martyrdom of the Two

Johns" (1509-11). The action of this work is intense, and the color, though gorgeous, is well harmonized. His other works include an "Enthroned Virgin," Berlin Gallery; two half-length devotional figures of "Christ" and the "Virgin" at Antwerp and "an Adoration of the Kings" in the Metropolitan Museum, New York.

His few surviving portraits are strong and realistic and show a skillful rendition of character. Genuine examples are those of Ægidius at Longford Castle; of Jean Carondelet in the Pinakothek, Munich; Erasmus in the Stroganoff Palace, Rome; the "Man with the Eyeglasses" in the Städel Institute, Frankfurt; and the "Choir Master" in the Liechtenstein Gallery. By emphasizing the worldly occupation of the sitters, as in his well-known "Banker and his Wife" (1514, Louvre), he prepared the way for the genre picture of the future. Consult Walter Cohen, *Studien zur Quinten Metsys* (Bonn, 1904), and Jean de Bosschère, *Quinten Metsys* (Brussels, 1907).

MAT'TATHI'AS (the Gk. form of the Heb. *Mittithyāh*, or, more correctly, *Mattathyāh*, gift of Yahwe). The name of several individuals of the Maccabean period of Jewish history, the most noted of whom was the aged priest of the Hasmonæan family (cf. 1 Macc. ii), who started the revolt against Syria (168 B.C.) and whose sons, Judas, Jonathan, and Simon, brought it to a successful issue. See MACCABEES.

MAT'TAWA, māt'ā-wā, or **MATTAWAN**, māt'ā-wōn. A town in Nipissing District, Ontario, Canada, at the east end of Lake Timiskaming, at the junction of the Ottawa and Mattawa rivers, 45 miles east of North Bay (direct), and on the Canadian Pacific Railroad (Map: Ontario, F 1). It is an important distributing point for lumbering districts, and a favorite rendezvous for moose-hunting parties, sportsmen, and anglers. The town has an electric-lighting plant. There are large mica deposits in the vicinity. Pop., 1901, 1400; 1911, 1524.

MATTAWA RIVER. A tributary of the Ottawa River, Canada. It has its source in Trout Lake, near Lake Nipissing, and after an eastward course of 50 miles flows into the Ottawa River at Mattawa Town. Prior to the railway era it was an important trading route from upper Ottawa to the Great Lakes and is much resorted to for the fine angling it affords. Lake Huron, at an earlier stage in its history, drained through Lake Nipissing and the Mattawa River to the Ottawa.

MATTEAWAN, māt'ā-wōn'. Formerly a village in Dutchess Co., N. Y., merged in 1913 with the village of Fishkill Landing (q.v.) to form the new city of Beacon (Map: New York, A 1). It has the State Hospital for the Criminal Insane, Highland Hospital, and the Howland Circulating Library. Good water power is afforded for manufacturing, and its industries are represented by wool and straw hat shops, machine shops, silk and embroidery mills, etc. Matteawan was founded in 1814, and its population in 1910 was 6727 (excluding the patients in the insane asylum).

MATTE (māt) **COPPER**. A combination of the metal and sulphur, other elements occurring in minor proportions. It is the product formed by smelting ores containing sulphur, copper, and (usually) iron. It is essentially a mixture of cuprous sulphide (Cu₂S) and FeS, and almost

always carries a small amount of magnetite as an impurity. It has great affinity for silver and gold and collects these metals when they occur in the furnace charge, a property which is fully utilized in metallurgy. The copper and iron are replaceable by any or all of the heavy metals, nickel, cobalt, lead, manganese, etc., and also to a small extent by the alkalies and alkali earths. The sulphur may be replaced in part by antimony, arsenic, selenium, and tellurium, but when any great amount of the sulphur is so replaced, the compound assumes different characteristics both chemically and physically, and is then known as speiss. Matte assumes different colors as the sulphur content changes and is known from these appearances as blue metal, white metal, or regulus. The further treatment of matte always consists of an oxidation, the sulphur being expelled as sulphur dioxide; the iron oxidized to ferrous oxide, which is combined with silica to form a fusible slag, while that portion of the copper first oxidized reacts with the unchanged sulphide to form sulphur dioxide, leaving the metallic copper carrying silver and gold. See COPPER, section on *Metal-lurgy*.

MATTEO DI BASSI, mât-tă'ô dē bäs'sê. An Observantine Franciscan, founder of the Order of the Capuchins (q.v.).

MAT'TER (OF. *matière*, *matere*, *matire*, Fr. *matière*, from Lat. *materia*, matter; connected with Skt. *mā*, to measure, build). In ordinary language, the material world is discriminated from the world of mind, although it is conceded that all our knowledge of the former comes to us through sensation. In so far as matter is conceived as the basis of the reality of the physical world, the term designates the object matter of all physical science. It is defined in physical treatises wholly by its properties.

PROPERTIES OF MATTER

From the standpoint of physics, the properties of matter may be classified as inertia, weight, and various characteristics of size, shape, and molecular connections. When one changes the motion of a piece of matter in any way one is conscious of a definite sensation, the intensity of which depends upon two things—the suddenness of the change and the quantity of the matter, using this word "quantity" in a general sense. This sensation, being associated with matter, is said to be due to a definite property of matter, which is called its "inertia" (q.v.). Again, if a portion of matter is held in the hand and so kept from falling towards the earth, there is a definite sensation which is attributed to a property of matter called "weight." It can be shown that if our senses were delicate enough they would experience a similar sensation when any two pieces of matter, e.g., two bullets, were held a small distance apart. See GRAVITATION.

There are a great many properties common to all kinds of matter, but to different degrees; while other properties are confined to certain forms of matter, e.g., solids or liquids or gases. A *solid* has a definite shape and size of its own, which can, however, be changed by the application of certain forces. Some solids, e.g., copper, have *ductility* (q.v.) and can be drawn out into wires; some have *malleability* (q.v.) and can be hammered out into thin sheets; some have *porosity* (q.v.) and allow various other portions of matter to pass through them; some are

"glazed" and are nearly impervious to other portions of matter; some are hard, others soft; some are brittle, others tough; some are plastic, like putty, etc.

A *liquid* is such a form of matter that, if left to itself in air (or in any gas or other liquid with which it does not mix), it forms a spherical drop, or, if contained in a hollow solid here on the surface of the earth, it takes the shape of the vessel, keeping a constant volume. A liquid has then certain molecular properties in its surface which make it contract as far as possible. See CAPILLARITY.

A *gas* is such a form of matter that, being contained within any closed vessel, it distributes itself uniformly throughout the space open to it; thus having neither a shape nor a size of its own. (See GASES, GENERAL PROPERTIES OF.) Gases and liquids are called *fluids* because they can flow; they yield to any force, however small, which is acting in such a direction as to make one layer move over the other. (See HYDROSTATICS.) Some bodies behave as liquids to feeble but long-continued forces, but as solids to intense and sudden forces; shoemaker's wax will flow so as to fill a tumbler if time is given, but it may be broken by a sudden blow, just like a piece of glass.

All forms of matter are divisible into smaller parts. (See following paragraphs on *Theories of Matter*.) They are also more or less "elastic"; that is, if the shape or size of a solid is deformed slightly by a small force, or if the volume of a fluid is so changed, they will return to their previous conditions more or less perfectly when the deforming force is removed; this proves the existence of internal molecular forces of restitution. (See ELASTICITY.) Whenever the shape of a solid is changed—not the shape of the whole solid necessarily, but the shape of the little cubical portions out of which the body may be imagined constructed—there is always to some degree a slipping of the layers of matter over each other, and corresponding internal or molecular friction. Similarly, if currents are produced in fluids, there is more or less friction between the layers, which is attributed to a property called *viscosity* (q.v.). In the case of liquids there is a superficial viscosity also, which is made manifest when a body floating on the surface is moved.

A property common to all forms of matter is that of "diffusion"; if two portions of different kinds of matter are brought closely together—"in contact"—it is believed that there is always a passage across the bounding surface of molecules of the two kinds of matter. Sometimes this passage can be actually observed, e.g., in the case of any two gases, two such liquids as water and alcohol, two such solids as lead and gold.

Since matter as such has so many properties, inertia, weight, size, elasticity, etc., two portions of matter may have some properties in common and not others. Therefore, if two portions of matter are to be defined as equal, or to have equal quantities, it is necessary to select some basis of comparison. By *definition*, two portions of matter are said to have equal quantities—or equal "masses"—if they have the same inertia; the experimental test being imagined somewhat as follows: Subject one body to the propulsive action of a compressed spring, measure its velocity along a smooth horizontal table; compress the same spring to the same

amount as before, allow it by its expansion to set in motion a second body, and measure its velocity; if these two velocities are the same, the two bodies have the same inertia.

Newton, and later Bessel, proved that the acceleration of a falling body towards the earth at any one place on the earth's surface is a constant for all kinds and amounts of matter. (See GRAVITATION.) Call it g . The weight of a body of mass m is mg ; and so if two bodies have the same mass, as defined above, they also have the same weight, and conversely. Consequently the mass of a body is always in practice measured by comparing its weight with that of a combination of standards. A standard body is chosen, a gram; other bodies of the same mass are made; others whose masses are fractions or multiples of that of the standard; etc. Such a set of bodies is called a "set of weights."

It is believed that matter as such is indestructible; that is, however it changes its form or whatever reactions it undergoes, a portion of matter preserves its mass unaltered. This idea, which is entirely in accord with all experiments and observations, is called the principle of the conservation of matter. It is perfectly possible that the *weight* of a body changes as its temperature, or one of its other properties, is altered, but there is no experimental evidence in favor of such an idea. For full discussion of properties of matter, the reader may consult Tait, *Properties of Matter* (Edinburgh, 1885).

THEORIES OF MATTER

Many theories have been advanced to account for the properties of matter; some deny an objective reality to matter, others affirm it. It is possible to show that all observed phenomena in nature may be predicted from certain general mathematical equations, the quantities in which are not necessarily connected with the perceptions of man; and that our mode of interpreting these qualities in terms of matter is not the only possible one. Again, there was a theory of matter, due to Bosovich, in which all actions of matter, as revealed by our senses, are attributed to "force centres," which act on each other according to different laws for different distances. This theory fails to explain inertia.

All theories which affirm the objective reality of matter consider any portion of it as made up of "molecules" and "atoms," meaning by molecule the smallest portion of the given kind of matter which retains the properties of the whole (e.g., a molecule of copper, of water), and by atom the smallest portion obtained in chemical reactions. There are many theories of this kind, which differ in the way they regard molecules and atoms; but they all agree in one respect, they consider both the molecules and atoms to be in motion. On the idea that molecules are in motion it is possible to explain the main differences between solids, liquids, and gases and the principal features of diffusion, osmosis, evaporation, dissociation, heat conduction, fluid pressure, viscosity, etc., and in particular to deduce the most important properties of a gas. Such theories as this are called "kinetic theories." On any kinetic theory the molecules of a gas are conceived to be in motion in paths long compared with their own size, the average length of path being called the "mean free path." It is possible by identifying certain actual physical quantities, such as pressure, viscosity, diffusion, with these quantities as predicted by mathematical treat-

ment of the simple kinetic theory of gases, to arrive at an idea as to the order of magnitude of the number of molecules in one cubic centimeter, and the length of the mean free path at different pressures, etc. The approximate number of molecules in 1 cubic centimeter at atmospheric pressure is 2.7×10^{19} , the mean distance apart of two molecules is about 2.6×10^{-7} centimeters, the mean free path is about 1×10^{-5} centimeters, and the volume actually filled by the molecules in 1 cubic centimeter is $\frac{1}{8000}$ cubic centimeter. If the pressure is diminished, these quantities all change.

If the pressure is reduced to .001 centimeter of mercury, the mean free path becomes about 1 centimeter. A space so exhausted of matter as this has special physical properties and is called a "Crookes' vacuum" or the "fourth state of matter."

In a liquid the molecules are supposed to be moving about, having encounters with each other, rebounding, etc., yet having practically no free path.

In a solid the molecules are supposed to be held more or less in fixed positions, about which they may vibrate, thus forming an elastic configuration which can be strained or even permanently deformed.

In the cases of all three—gases, liquids, and solids—while the molecules are moving about, the electrons (see ELECTRON) in the atoms forming the molecules are making immensely rapid vibrations, which produce the ether waves manifested by thermal, luminous, and chemical effects when they are absorbed. (See RADIATION.) These kinetic ideas of molecules and atoms can be used to form a concrete picture of nearly all the phenomena and properties of matter.

The question remains, What is the "atom"? One idea was that an atom is a perfectly elastic sphere, which is obviously incompatible with facts. Another theory which has been much discussed is that atoms are vortices in a perfect fluid. The simplest type of vortex (q.v.) is like a smoke ring; but there are many more complicated forms, which can be shown to be stable. A vortex once formed in a perfect fluid will maintain its identity as it moves about, not being a wave motion passing through the fluid, but always consisting of the same portion of the fluid; vortices are elastic; they can "combine," or come together and form a single system. Thus, if atoms are simply vortices of ether moving freely through the ether, many of the properties of matter may be explained. A still more recent theory of matter is based upon the fact that an electric charge has an inertia quite apart from that of the matter which carries the charge. (See ELECTRON.) Consult Ames, *The Constitution of Matter* (Boston, 1913).

MATTER, mǎ'tǎr', JACQUES (1791-1864). A French philosopher, born in Alsace. He was educated at Strassburg, Göttingen, and Paris, and in 1820 was appointed professor of history and director of the College of Strassburg. In 1832 Guizot made him inspector general of the University of Paris. In 1845 he was chosen inspector of the French public libraries. He retired in 1846 to Strassburg to become professor in the Protestant theological seminary there. He was the author of a great number of standard works, among which are: *Essai historique sur l'école d'Alexandrie* (1820; 2d ed., as *Histoire de l'école Alexandrie, etc.*, 1840-44); *Histoire critique du gnosticisme, etc.* (1828; 2d ed., 1843-44); *Histoire universelle de l'église chrétienne* (1829-35; 2d ed., 1839); *De l'influence des mœurs sur les lois et des lois sur les mœurs* (1832; 2d ed., 1843), crowned by the Academy; *Histoire des doctrines morales et politiques des trois derniers siècles* (1836-37); *De l'affaiblissement des idées et des études morales* (1841); *De l'état moral, politique, et littéraire de l'Allemagne* (1847); *La philosophie de la religion* (1857); *La morale, etc.* (1860); *Saint Martin* (1862; 2d ed., 1864); *Emmanuel de Swedenborg* (1st and 2d ed., 1863); *Le mysticisme en France au temps de Fénelon* (1864).

MATTERHORN (Fr. *Mont Cervin*, It. *Monte Cervino*). The grandest mountain mass of the Alps, located near Zermatt in Switzerland, between the Canton of Valais and the Val d'Aosta in Italy, in the Pennine group (Map: Switzerland, B 3). Its height is 14,782 feet, but that fact alone gives little idea of the sublimity of its abrupt rise above the great range of which it is the sentinel peak. The vast glaciers around it have their upper sources in snows at the foot of this mighty crag, which rises on its northerly face in a sheer precipice nearly 4000 feet above them. It was deemed impossible of ascent previous to 1865, when its top was reached by Whymper, who lost four of his party in the return. Its ascent is now made less perilous by a hut built at a height of 12,526 feet, and by the familiarity of the guides with the most dangerous points, and the means to surmount them. Consult John Tyndall, *Hours of Exercise in the Alps* (New York, 1899), and Edward Whymper, *Scrambles Amongst the Alps* (5th ed., London, 1900).

MATTEUCCI, mǎ'tǎ-ōōt'ché, CARLO (1811-68). An Italian scientist, born at Forlì, Romagna. He studied the physical sciences at the Ecole Polytechnique in Paris, and through the influence of Humboldt was made professor of physics in the University of Pisa. Previously he had taught at Bologna and Ravenna. He devoted himself especially to the investigations of the physiological effects of electricity, and published his results in French, English, and Italian journals of science. He also wrote: *Lezioni di fisica* (4th ed., 1851); *Lezioni sui fenomeni fisico-chimici dei corpi viventi* (2d ed., 1846); and *Cours spécial sur l'induction, le magnétisme de rotation, etc.* (1854). In 1860 he was made Senator by the Grand Duke of Tuscany, and in 1862 for a few months he held the portfolio of Public Instruction in the Rattazzi ministry.

MATTEUCCI, RAFFAELE VITTORIO (1846-1909). An Italian seismologist, born at Seni-

gallia, Italy. He graduated from the University of Naples; studied at the University of Heidelberg; and then investigated seismic disturbances, especially those of Mount Vesuvius. In this connection he made especially important researches. In the Vesuvius eruption of 1900 he was severely injured, but two years later he succeeded Palmieri as director of the observatory on that mountain. In 1906 he remained at his post throughout the eruption (which he had predicted) and sent messages to allay the panic in the cities below, although the building where he was stationed was wrecked.

MATTHAEI, mǎt-tǎ'è, CHRISTIAN FRIEDRICH (1744-1811). A German classical scholar, born at Gröst, Thuringia, and educated at the University of Leipzig. From 1774 to 1784 he was professor of classical literature at the University of Moscow. In 1789 he was made professor of Greek at the University of Wittenberg. He published many valuable manuscripts from the Moscow Library, a codex of Homeric hymns, and edited *Plutarchi Libellus de Superstitione* and *Demosthenis Oratio Funebris in Laudem Atheniensium qui pro Patria Pugnando Cæsi Sunt ad Chæroneam*. He also edited, among other works, *Gregorii Thessalonienensis X Orationes* (1776) and *Novum Testamentum XII Tomis Distinctum Græce et Latine* (1788).

MATTHESON, mǎt-tǎ-zōn, JOHANN (1681-1764). A German composer and writer on music, born at Hamburg. In 1697 he entered upon his career as a singer, and two years later sang one of the rôles and also conducted at the harpsichord his first opera, *Die Pleyaden*. From 1703 dates his acquaintance with Handel. In 1706 he obtained the post of secretary to the English Legation. In 1715 he was appointed musical director and canon at the Hamburg Cathedral, and while there did much towards developing the then unknown form of church cantata, and made the innovation of introducing female singers into his choir. In 1719 he also became court chapelmaster to the Duke of Holstein. From 1728, when deafness caused him to resign the post of musical director at the cathedral, to his death, he devoted himself largely to writing. His compositions are unimportant, but he made many excellent translations of English works on politics and jurisprudence. A man of wide culture, his numerous theoretical and historical works are remarkable for their catholicity of view, and are also of lasting value, as they were largely instrumental in firmly establishing the modern system of music. Most notable are: *Das neu-eröffnete Orchester, oder gründliche Anleitung* (1713); *Critica Musica* (1722); *Das forschende Orchester* (1721); *De Eruditione Musica* (1732); and *Die neueste Untersuchung der Singspiele* (1744). Consult L. Meinardus, *Johann Mattheson und seine Verdienste um die deutsche Tonkunst* (Leipzig, 1879).

MATTHEW, mǎth-ū (Lat. *Matthæus*, from Gk. *Matthaios*, *Matthaios*, from Heb. *Mattithyāh*, gift of Yahweh). The Evangelist, identical with the publican whom Mark and Luke called Levi. He was the son of Alphæus. The Hebrew name Matthew, probably meaning "the gift of Jehovah," was perhaps a surname analogous to Cephas as added to Simon. He was early called to be a disciple and was afterward numbered among the Twelve Apostles. He was a publican, living at or near Capernaum, probably one of the subordinate class who were charged with collect-

ing the taxes in a limited district. Having left all to follow Jesus, he also made him a feast in his house, at which a great multitude of publicans were present as invited guests (Matt. ix. 9-13 and parallels). After the record of his choice as one of the Apostles, given by three Evangelists—of whom only Matthew speaks of himself as the publican—no mention is made of him in the New Testament, except in the group named in Acts i. 13. A tradition as old as the beginning of the second century says that the Twelve continued in Jerusalem about 12 years after the ascension. The statement of Eusebius, made long afterward, that he preached to his own nation before he went to foreign countries, accords with this. Among the countries mentioned by other writers are Ethiopia, Persia, Macedonia, Media, and Parthia. Several of the earlier writers agree in numbering him among the few Apostles who did not suffer martyrdom, though a later tradition affirms that he, too, sealed his testimony with his blood. For his relation to the Gospel of Matthew and for bibliography, see MATTHEW, GOSPEL OF.

MATTHEW, GEORGE FREDERICK (1837-). A Canadian geologist. He was born at St. John, New Brunswick, and was educated at the University of New Brunswick. He entered the civil service in 1853, became chief clerk of customs in 1879, and in 1893 surveyor of customs. He prepared in 1872, with Professor Bailey, a preliminary report on the geology of southern New Brunswick; in 1872-73 he wrote a report on the carboniferous system of that province and a summary of his observations. For many years he conducted geological observations in the Maritime Provinces. He was elected a fellow of the Royal Society of Canada and vice president of the Natural History Society of New Brunswick. He contributed geological papers to the *Quarterly Journal of the Geological Society*, *Canadian Naturalist*, *Silliman's Journal*, *American Geologist*, *Geological Magazine*, *Canadian Record of Science*, and *Transactions of the Royal Society of Canada*.

MATTHEW, GOSPEL OF. The first of the four Gospels in the New Testament. After an artificially constructed genealogy of Jesus traced through Joseph's line back to Abraham are narrated the announcement to Joseph of Jesus' coming birth, the visit of the Wise Men from the East, the flight of Joseph and his family into Egypt, Herod's massacre of the children, and the return of the fugitives "into the land of Israel" (i, ii). Then follows a brief résumé of the ministry of John the Baptist, leading up to Jesus' baptism by John and his temptation in the wilderness (iii-iv. 11). The narrative proper begins with Jesus' withdrawal into Galilee and his active entrance upon his work. The record of this work is divided into three principal parts: (a) his ministry in Galilee (iv. 12-xv. 20); (b) his ministry in the regions north and east of Galilee (xv. 21-xvii. 20); (c) his ministry in Jerusalem (xxi-xxv). These parts cover in general the same events as the main portions of Mark and Luke, but the events themselves are arranged in a way peculiar to this Gospel. The arrangement of material is topical rather than chronological. Thus, after a short introductory passage (iv. 12-25) there follows a lengthy discourse treating of the Messianic Kingdom—the composite address known as the Sermon on the Mount (v. 1-vii. 29). Then come a group of miracles (viii. 1-ix. 34)

and a collection of sayings which are of a more general character than those contained in the Sermon on the Mount (ix. 35-xiii. 48). More miracles (xiv. 13-36) and certain sayings concerning Pharisaic traditions (xv. 1-20) complete the section which describes the Galilean ministry of Jesus. The same arrangement is carried out in the second main portion of the narrative, i.e., the ministry in the regions north and east of Galilee; but the groups in this section are all relatively small. First two miracles are related, the former of which is evidently intended to represent the mission to the Gentiles (xv. 21-39), and then follow the request of the Pharisees and Sadducees for a sign, the warning against the leaven of the Pharisees, Peter's confession in the neighborhood of Cæsarea Philippi, and Jesus' first prediction of his passion (xvi). At the end of this part the transfiguration of Christ and the healing of the epileptic are recorded (xvii. 1-20). Next comes a passage of considerable length which serves as a transition from the second to the third part of Jesus' ministry (xvii. 22-xx). It consists chiefly of discourses delivered in Galilee and on the way to Jerusalem, and here too the evangelist's tendency to arrange his material in groups is noticeable. Finally we have the account of Christ's ministry in and near Jerusalem (xxi-xxv). Here, however, apart from the introductory passage containing a record of the triumphal entry into the city, the cleansing of the temple, the objection of the chief priests and scribes, and the cursing of the fig tree (xxi. 1-19), the whole narrative is concerned with the discourses and discussions of Tuesday in Passion Week. The story of Jesus' life ends with his passion—the Passover meal, the agony in Gethsemane, the betrayal, arrest, trial, crucifixion, and burial (xxvi-xxvii). The last chapter of the Gospel records the resurrection of Christ and his appearance to the 11 Apostles in Galilee (xxviii).

From this arrangement of his material it is clear that the evangelist desired to prove to his readers that Jesus of Nazareth was the long-expected Messiah. The writer's purpose is also indicated by the prophetic setting in which the narrative is placed. The birth of Jesus, the events of his life, and the circumstances connected with his death are not looked upon as accidentally corresponding to certain Old Testament predictions. They are rather regarded as part of a divinely ordered plan, according to which Jesus is at once the fulfillment of prophecy and the consummation of theocratic history. Though reared within the pale of Judaism, he is nevertheless the Messiah of a community that is wider than the confines of Israel.

The principal sources used by the evangelist were the Gospel of Mark, probably in substantially its present form, and a document known to scholars as Q (i.e., Ger. *Quelle*, 'source'). The latter, which seems to have contained some narratives of events as well as sayings of Jesus, was written by a Jewish Christian in Palestine before the fall of Jerusalem in 70 A.D. It may indeed have antedated that catastrophe by two decades. Though this work was composed in Aramaic, the language spoken by Jesus and his companions, the author of the First Gospel made use of it in a Greek translation. According to Papias of Hierapolis, who lived in the first half of the second century, the Apostle Matthew wrote down the sayings of Christ in Aramaic; and a number of modern scholars identify Q in

its original form with the work referred to by Papias. Some critics hold that the genealogy and the stories concerning Jesus' birth and infancy in chapters i and ii are based on sources of Palestinian origin. In any case, this part of the work is of much less value from an historical point of view than the sections which are based upon Mark or Q.

It can hardly be doubted that the Gospel according to Matthew is the work of a Jewish Christian, for its presentation of Jesus (cf. v. 17, x. 6 f., xv. 24, xxiii. 2 f.) as well as its general characteristics are distinctively Jewish. Moreover, quotations from the Old Testament which are not found in the parallel sections of Mark and Luke follow the Hebrew original or an Aramaic version rather than the LXX. On the other hand there are many indications that the author held no brief for the evils of Judaism (cf. iii. 7 ff., xvi. 11 f., xxiii. 3-36) and that he was in full sympathy with the Gentile element in the Church (cf. viii. 10 ff., xxi. 43), and there are some passages which betray an ecclesiastical or catholic interest (e.g., xvi. 18 f., xviii. 16 f., xxviii. 19 f.). This combination of heterogeneous elements constitutes one of the peculiar problems of the First Gospel. Since the evangelist felt it to be necessary to explain Palestinian customs and beliefs (e.g., xxii. 23, xxvii. 15) and to interpret Hebrew and Aramaic words and phrases (e.g., i. 23, xxvii. 33, 46) for the benefit of his readers, it is clear that the latter lived outside of Palestine and spoke Greek. They may have been Jewish Christians. It is impossible, however, to determine where the Gospel was written. Palestine, Syria, Asia Minor, and Rome have been suggested by different scholars for the honor, and something can be said for each; but on the whole it seems better to render a verdict of non liquet concerning the place of composition.

The date of the Gospel according to Matthew has been much discussed. It is certainly later than Mark and the collection of Jesus' sayings known as Q; for, as we have seen, the author of Matthew uses both of these as sources for his work. With Luke, however, he seems to have been unacquainted. Was the Gospel of Matthew written before or after the fall of Jerusalem in 70 A.D.? On the one hand the capture of the city and the coming of Christ are not clearly distinguished, as we should expect them to be in a work written after the former event; but on the other hand, as we have seen, Matthew reflects views or interests of an ecclesiastical or catholic type which cannot have prevailed until the latter part of the first century. It must be remembered that indications of a later time have more weight in determining the date of the Gospel than those which point to an earlier period, for the latter may be due to the sources used. A consideration of all the available data leads the present writer to the conclusion that the Gospel of Matthew was written sometime during the last quarter of the first century (75-100 A.D.). It is not necessary to assign it to a later date.

Since the time of Irenæus, who wrote c.180-185 A.D., the First Gospel has been attributed to the Apostle Matthew; but both its style and contents preclude the possibility of its having been written by a companion of Jesus. It is certainly not a translation from an Aramaic original, nor does it represent exclusively the point of view of the first disciples. How, then,

did the name of Matthew, who was by no means a prominent member of the apostolic company, become attached to the Gospel? The simplest and most plausible explanation is that he was the author of Q in its Aramaic form, which in a Greek translation was one of the two chief sources used in the composition of the Gospel. The association of the work with the name of the Apostle Matthew caused it to be highly esteemed in the Church and assured it an honored place in the canon.

Bibliography. On questions relating to the characteristics, structure, date, and authorship of Matthew, see the pertinent sections in the Introductions to the New Testament by Bernhard Weiss (Eng. trans., 2 vols., London, 1887-88), Adolf Jülicher (Eng. trans., ib., 1904), Theodor Zahn (Eng. trans. from the 3d Ger. ed., 3 vols., ib., 1909), A. S. Peake (New York, 1910), and James Moffatt (ib., 1911). E. Jacquier, *Histoire des livres du Nouveau Testament* (Paris, 1902-08), represents modern Roman Catholic scholarship. Consult also J. A. Robinson, *The Study of the Gospels* (London, 1903), and E. D. Burton, *A Short Introduction to the Gospels* (Chicago, 1906). Among commentaries the following may be mentioned—English: J. Morison (London, 1895); Alfred Plummer (New York, 1909); W. C. Allen, in *The International Critical Commentary* (ib., 1910); A. B. Bruce, in *The Expositor's Greek Testament* (ib., 1912). German: Bernhard Weiss, in H. A. W. Meyer, *Kritisch-exegetischer Kommentar über das N. T.* (Göttingen, 1898); Theodor Zahn, in his *Kommentar zum N. T.* (Leipzig, 1903); Julius Wellhausen (Berlin, 1904). The student should also consult the following works: Paul Wernle, *Die synoptische Frage* (Freiburg, 1899); Adelbert Merx, *Die vier kanonischen Evangelien nach ihrem ältesten bekannten Texte* (Berlin, 1902-05); E. D. Burton, "Principles of Literary Criticism and the Synoptic Problem," in *The Decennial Publications of the University of Chicago*, vol. v (Chicago, 1904); A. F. Loisy, *Les évangiles synoptiques* (2 vols., Paris, 1907-08); Sir J. C. Hawkins, *Horæ Synopticæ* (2d ed., Oxford, 1909); Sanday and others, *Studies in the Synoptic Problem* (Oxford, 1911); Julius Wellhausen, *Einleitung in die drei ersten Evangelien* (2d ed., Berlin, 1911).

MATTHEW OF WESTMINSTER. An imaginary name by which the supposed author of the *Flores Historiarum* was designated. Luard demonstrated that no such person ever existed, and that the *Flores* was the work of several different authors. Consult Luard's preface to his edition of the *Flores*, in three volumes (London, 1890), in the "Rolls Series."

MATTHEW PARIS, or MATTHEW OF PARIS. An English chronicler. See PARIS, MATTHEW.

MATTHEWS, mǎth'ūz, (JAMES) BRANDER (1852-). An American author and educator, born in New Orleans. He graduated from Columbia College in 1871 and from Columbia Law School in 1873, but he turned to a literary career. From 1892 to 1900 he was professor of literature at Columbia, and thereafter held the chair of dramatic literature. It was as a critic of the drama that he became especially known. He was one of the founders of the Authors Club and of the Players Club, both of New York; one of the organizers of the American Copyright League; a member of the American Academy of Arts and Letters and president (1913) of the National Institute of Arts and Letters; the first

chairman (1906) of the Simplified Spelling Board; and president of the Modern Language Association of America (1910). In 1907 the French government decorated him with the Legion of Honor. His writings consist mainly of essays on the theatre, of comedies, and of short stories, yet *Americanisms and Briticisms* (1892) might be classified as a linguistic study. As their titles imply, *Aspects of Fiction* (1896; revised in 1902) and *An Introduction to the Study of American Literature* (1896) enter upon other fields. *His Father's Son* (1895), a novel, deals with a New York broker's influence on his son. Sketches of New York life, called *Vignettes of Manhattan*, appeared in 1894, *Studies in Local Color* appeared in 1898, and *A Confident To-Morrow* in 1900. Matthews's dramatic criticism, which is French in tone, includes *French Dramatists of the Nineteenth Century* (1881; revised in 1891 and 1901) and *Studies of the Stage* (1894), to which may be added *The Theatres of Paris* (1880). His comedies, which are literary rather than practically dramatic, include *Margery's Lovers* (1884), *In the Vestibule Limited* (1892), and *The Decision of the Court* (1893). More recent works are: *The Action and the Word* (1900); *The Historical Novel and Other Essays* (1901); *Parts of Speech, Essays on English* (1901); *The Philosophy of the Short-Story* (1901); *Actors and Actresses of the United States and Great Britain* (5 vols., 1886), with Laurence Hutton; *The Development of the Drama* (1903); *The Short Story* (1907); *Americans of the Future and Other Essays* (1909); *Molière: His Life and Works* (1910); *Introduction to the Study of American Literature* (1911); *Shakespeare as a Playwright* (1913); *On Acting* (1914); *The Oxford Book of American Essays* (1914).

MATTHEWS, mǎth'üz, EDMUND ORVILLE (1836-1911). An American naval officer, born at Baltimore. He entered the Naval Academy in 1851 and graduated in 1855. He became a passed midshipman in 1858 and a master in the same year, lieutenant in 1860, lieutenant commander in 1862, commander in 1870, captain in 1881, commodore in 1894, and rear admiral in 1898. In 1861 he served on the *Wabash* and was at the capture of the forts at Hatteras Inlet. In 1864-65 he commanded the *Sonoma* off Charleston and assisted in constructing the naval battery on Morris Island. While on this duty he commanded the naval light artillery at the battles of Honey Hill and Tullifinny Crossroads, and was also attached to the staff of Admiral Dahlgren. From 1869 to 1872 he was head of the torpedo corps of the navy and established the naval torpedo station at Newport. He commanded the *Ashuelot* (1873-77), the *Powhatan* (1881-83), and the *Brooklyn* (1885-86). He was chief of the Bureau of Yards and Docks (1894-96) and, when he retired in 1898, was president of the Examining Board; from this duty he was relieved in the following year.

MATTHEWS, MARK ALLISON (1867-). An American Presbyterian clergyman, born at Calhoun, Ga. He began preaching at 19; was ordained in 1887; and served as pastor in his native town (1888-93), at Dalton, Ga. (1893-96), and at Jackson, Tenn. (1896-1902). Thereafter he occupied the pulpit of the First Church at Seattle, Wash. (said to be the largest Presbyterian church in the United States), and became noted as a preacher. In addition to his pastoral

duties he studied law and was admitted to the bar in 1900. In 1912 he was chosen moderator of the General Assembly of the Presbyterian Church, at Louisville. Three years later, as chairman of a committee to investigate Union Theological Seminary, he visited New York and afterward reported unfavorably to the General Assembly of 1915, held at Rochester, regarding doctrines taught in the seminary.

MATTHEWS, MARMADUKE MATTHEWS (1839-1913). A Canadian landscape painter. He was born in Warwickshire, England, and was educated at the Cowley Diocesan School, Oxford, and in London. He came to Toronto, Upper Canada, in 1860 and in 1864 removed to New York City, where he remained five years. He returned to Toronto and became one of the founders of the Ontario Society of Artists, of which he was made secretary in 1875 and president in 1894. He was one of the original members of the Royal Canadian Academy (1880). His paintings of Rocky Mountain scenery, especially well known, include "The Canadian Wonderland" and "The Conquered Portal" (Rogers Pass, Selkirk Mountains). Matthews painted also many woodland studies of old Canada and New England.

MATTHEWS, PAUL (1866-). An American Protestant Episcopal bishop. He was born at Glendale, Ohio, and graduated from Princeton University in 1887 and from the General Theological Seminary, New York, in 1890. Ordained a priest in 1891, he had charge of St. Paul's and St. John's churches at Omaha, Neb., in 1891-95; at Cincinnati, Ohio, he was rector of St. Luke's from 1896 to 1904 and dean of St. Paul's Cathedral in 1904-13; and in 1913-14 he was dean of the cathedral at Faribault, Minn., and professor at the Seabury Divinity School. He was elected Bishop Coadjutor of Milwaukee in 1905, but declined; in 1914 he was elected and in 1915 consecrated Bishop of New Jersey.

MATTHEWS, PETER (?1792-1838). A Canadian patriot. He was the son of a United Empire Loyalist who fought in the Revolutionary War and who afterward emigrated to Upper Canada and settled in Pickering township. He served under Sir Isaac Brock and fought in various battles during the war of 1812-15, but in 1837 joined the insurrectionary forces under William Lyon Mackenzie (q.v.) and took part in the Upper Canada rebellion. Upon the defeat and flight of Mackenzie he was captured, tried, and, with Samuel Lount (q.v.), was executed at Toronto on April 12, 1838.

MATTHEWS, STANLEY (1824-89). An American soldier and jurist, born in Cincinnati, Ohio. He graduated at Kenyon College in 1840, practiced law in Cincinnati, and was judge of the Hamilton County Court of Common Pleas in 1851-53. He was elected to the State Senate in 1855, was United States attorney for the southern district of Ohio (1858-61), and at the outbreak of the Civil War was made lieutenant colonel in the Twenty-third Ohio Regiment, of which Rutherford B. Hayes (q.v.) was major. However, he saw service only with the Fifty-seventh Ohio, of which he was colonel, and with a brigade which he commanded in the Army of the Cumberland. He resigned from the army in 1863 and was judge of the Supreme Court of Cincinnati in 1863-64. On the resignation of John Sherman he was elected to the United States Senate as a Republican and served in 1877-79. He was appointed by President Gar-

field justice of the Supreme Court of the United States in 1881. He died at Washington.

MATTHEWS, SIR THOMAS (1849–). An English lighthouse engineer, brother of Sir William Matthews, born and educated in Penzance. In 1873 he became an assistant in the engineering department of the corporation of Trinity House, London (which has general supervision of English lighthouses, beacons, buoys, etc.), and in 1892 he became engineer in chief to the corporation. In 1881 he had planned the lighthouse on the island of Minicoy, north of the Maldives. For Trinity House he designed and built more than a dozen new lighthouses; greatly improved the corporation's buoy and beacon systems, notably by inventing a steel buoy with an occulting gas or acetylene light; devised a new system of fog signaling; and designed an incandescent oil burner for lighthouses. He was knighted in 1909.

MATTHEWS, WASHINGTON (1843–1905). An American physician and ethnologist, born at Killiney in Ireland. He graduated from the medical department of the University of Iowa in 1864; entered the United States army as assistant surgeon, and retired in 1895 with the rank of surgeon. He made ethnological and philological studies of North American Indian tribes, especially of the Navahos, and published: *Dictionary of the Language of the Hidatsa* (1873); *Navaho Silversmiths* (1883); *Navaho Weavers* (1884); *The Mountain Chant, a Navaho Ceremony* (1887); *Navaho Legends* (1897); *The Mystic Chant, a Navaho Ceremony* (1902). A posthumous work appeared in 1907, *Navaho Myths, Prayers and Songs*, edited by P. E. Goddard.

MATTHEWS, SIR WILLIAM (1844–). An English civil engineer, brother of Sir Thomas Matthews. He was born in Penzance and was privately educated in Cornwall. Coode, Matthews, Fitzmaurice, and Wilson, the firm of engineers of which he was a member, had charge of the great harbor works at Dover, Colombo, and Singapore and were consulting engineers for harbors to the colonial crown agents. Matthews served on the admiralty committee of 1901 on naval works at Gibraltar; on the royal commission of 1906 on coast erosion; on the international technical commission on the Suez Canal (1908); and on the royal commission of 1912 on oil fuel. He was knighted in 1906.

MATTHEW (māth'ū) **TOWN**. See INAGUA.

MATTHIAS, mā-thi'ās (Lat., from Gk. *Matthias*, a shorter form of *Marrablas*, *Mattathias*, from Heb. *Mattithyāh*, gift of Yahwe). The disciple chosen by lot to succeed Judas Iscariot as one of the Twelve Apostles (Acts i. 15–26). This is the only reference to him in the New Testament. Later tradition (Eusebius, *Hist. Eccles.*, i, 12; ii, 1) made him one of the Seventy (Luke x. 1). He figures prominently in the fanciful legends of late Christian apocryphal literature; a Gospel of Matthias and the Acts of Andrew and Matthias deal with his doctrine and his work among the Ethiopian cannibals.

MATTHIAS (1557–1619). Holy Roman Emperor from 1612 to 1619. He was born Feb. 24, 1557, a younger son of Maximilian II. In 1577 a Catholic party in the Belgian Netherlands offered him the governorship, which he accepted. He found his authority, however, hemmed in at all points and resigned in 1581. In 1593 his brother, the Emperor Rudolph II, appointed him Governor of the Archduchy of Austria. Matthias

exerted himself to suppress Protestantism, in which he had the assistance of the celebrated prelate Khlesl (q.v.). In consequence of the incapacity of Rudolph, whose oppressive acts had excited a formidable insurrection in Hungary, Matthias was formally declared by the Austrian princes head of the house of Hapsburgs in 1606. He thereupon came to terms with the Hungarian Protestants, concluding with them the Treaty of Vienna. Two years later he exorted from Rudolph, by the Treaty of Lieben, June 25, 1608, the cession of Austria, Hungary, and Moravia, and in 1611 the crown of Bohemia, of which Rudolph had been deprived by his subjects, was given to Matthias. Rudolph died without issue in 1612, and Matthias was at once chosen his successor in the German Empire. A confederation of Protestant states, known as the Union, had been established in 1608 and a Roman Catholic League had been organized in 1609. Matthias attempted unsuccessfully to bring the latter, which was under Bavarian leadership, under Austrian influence. In 1617 Matthias, who was without heirs, was compelled to have his cousin, Ferdinand of Styria, crowned King of Bohemia, and the next year King of Hungary. The Bohemians revolted against Ferdinand, enraged by the severity of his religious persecutions; the insurrection at Prague, in 1618, gave the signal for the outbreak of the Thirty Years' War (q.v.), and the last days of Matthias were embittered by the failure of all his efforts to restore peace. He died March 20, 1619. Consult J. Heling, *Die Wahl des römischen Königs Matthias* (Belgrade, 1892). See AUSTRIA-HUNGARY.

MATTHIAS, GOSPEL OF. See APOCRYPHA, *New Testament*.

MATTHIAS I, CORVINUS (1440–90). King of Hungary from 1458 to 1490. He was the second son of János Hunyady (q.v.) and was elected King of Hungary in 1458, in spite of the opposition of some of the great nobles, who offered the crown to the Emperor Frederick III. The boy King fought successfully against the Emperor, who sold his claims to the crown in 1462. Matthias had in the meantime to contend against the Turks, at that time under the rule of Sultan Mohammed II. In a war of several years' duration the Hungarian arms asserted themselves successfully against the forces of the conqueror of Constantinople. After some hostilities with Stephen, Waywode of Moldavia, Matthias engaged (1468) in a war against his father-in-law, George Podiebrad, King of Bohemia, which occupied him for some years and was followed by a war with Poland, after which he again turned his arms with success against the Turks. Matthias reached the height of his power when in 1485, in a war with the Emperor Frederick III, he made himself master of Vienna, the Hapsburg capital. There he died five years later. Matthias Corvinus was a great patron of arts and letters and adorned his capital with the works of renowned sculptors, in addition to a library said to contain 50,000 volumes. He sent a large staff of literary men to Italy for the purpose of obtaining copies of valuable manuscripts. He also adorned his court by the presence of the most eminent men of Italy and Germany, and himself was an author of no mean ability. At the same time the affairs of the government were not neglected. The finances were brought into a flourishing condition, industry and commerce were promoted by wise

legislation, the army was reorganized, and justice was strictly administered. Consult Fraknoi, *Mathias Corvinus*, German translation (Freiburg, 1891).

MATTHIESEN, mät'ê-sën, OSCAR ADAM OTTO WILLIAM (1861-). A Danish fresco painter, born in Schleswig. He studied at the Academy of Copenhagen, in Paris, and in Rome. In 1884 he was awarded a gold medal at the Academy of Copenhagen and in 1893 was Denmark's Commissioner at the World's Fair in Chicago. He attracted attention by greatly improving the technique of the art of fresco painting, which he had studied in Rome and Pompeii during 1901-03. Afterward he was a teacher at the Kunstakademie and the Kunstgewerbemuseum in Berlin. For the palace of the Prince of Monaco at Mentone he executed decorations in fresco and stucco relief. Among his paintings are: "Bathing Dragons," "Griffenfeld at Munkholmen," "Riders" (1904-06), "Working Horses," and "Leda and the Swan" (1908).

MATTHISON, mäh'i-son, EDITH WYNNE (1875-). An American actress, born in Birmingham, England, and educated there in the King Edward Grammar School and at Midland Institute. She made her first appearance on the stage in musical comedy at Blackpool in 1896. In 1897 she joined Ben Greet's company and remained with it, except for brief intervals, for the next six years, playing a wide range of parts, including such varied rôles as Miladi in *The Three Musketeers*, Portia, Peg Woffington in *Masks and Faces*, Clara Douglas in *Money*, Lady Teazle, and Rosalind. She achieved her first notable success at the Duke of York's Theatre, 1900, when at short notice she was called upon to play the part of Violet Oglander in *The Lackey's Carnival*. In May, 1903, she created the title rôle in the revival of the fifteenth-century morality play *Everyman* and achieved a greater triumph than any before in her career. Later in the same year she repeated her success in America, where the play created something of a sensation. The following year she appeared in the United States in Goldsmith's *She Stoops to Conquer* and in a repertory of Shakespearean plays. On her return to England she was engaged by Sir Henry Irving and played Portia and Rosalind to his Shylock and Jaques. After 1905 she appeared at various times in Greek and old English plays; but, with the exception of *Everyman*, her best work was in Shakespearean repertory and in the more poetic and imaginative types of modern drama, such as *The Blue Bird*, *Sister Beatrice*, *The Piper*, and *The Arrow Maker*, all of which were produced at the New Theatre, New York, in 1910-11. She appeared in several of the plays of Charles Rann Kennedy (q.v.), her husband, with success, *The Servant in the House* being the most notable. In the spring of 1915 she took part in Granville Barker's production of *Iphigenia in Tauris* and *The Trojan Women* of Euripides, given at the principal eastern universities and colleges of the United States.

MATTHISSON, mät'ê-zôn, FRIEDRICH VON (1761-1831). A German lyric poet, born at Hohendodeleben. Trained for the ministry at Halle, he supported himself by teaching till appointed (1794) reader to the Princess of Anhalt-Dessau, with whom he traveled in Switzerland, Tirol, and Italy. On her death (1811) he was attached to the court of Württemberg, as librarian and theatre director, and resided for

some time in Italy. His prose is mediocre, his verse melodious and graceful, especially in rural description, but never strong. Matthiesson's *Schriften*, as finally revised by the author, came out in eight volumes (Zurich, 1825-29). Volume ix (1833) contains a biography by Döring. Consult Boschulte, *F. Matthiesson, seine Anhänger und Nachahmer* (Elberfeld, 1900).

MATTIACORUM CASTELLUM. See CATTI; the first article HESSE; MAINZ.

MATTIACUM. See CATTI.

MAT'TING (from *mat*, AS. *meatta*, from Lat. *matta*, mat). A general name for various coarse woven or plaited fibrous materials for covering the floors of rooms, passages, lobbies, etc., for doormats, for hanging as screens, for packing furniture, or for packing heavy merchandise. Matting is extensively manufactured from straw, bulrushes, grasses of several kinds, and the leaves of various palms, and forms an important article of commerce. Floor matting, now so extensively employed as a cheap, cool, and cleanly substitute for carpeting, is woven from two entirely different materials—straw, made from a species of reed or grass having culms 6 feet high, and the fibrous husk of the coconut palm, called *coir*. (See COIR.) In recent years fibre and grass rugs are extensively employed for bungalows and summer cottages or for porches or temporary furnishing. Many of these are dyed or painted in various bright colors that when new prove very attractive. Most of the straw matting comes from China or Japan; the *Bungo* matting is made from a coarse straw, and the *Bingo* matting from a finer material, which is easier to manipulate, but not so durable as the coarse straw. The loom employed is a simple hand machine, consisting merely of an upright bamboo framework, with cylindrical crosspieces above and below, over which the warp runs, the woof being woven in without a shuttle. The warp threads are of hemp, oiled to make them smooth. The straw is woven while still wet and is then dried in the sun or over slow fires. Matting is either made in sections of 2 to 5 yards, which are afterward neatly joined together into a roll of 40 yards, or the fabric is all woven in one piece, in which case it is likely to be loose in texture. To remedy this the matting is loosened and pulled down closer by coolies while it is drying over a box containing a charcoal fire.

The yarn from which coco matting is woven is sometimes spun by machinery, but it is said that the hand-spun yarn is both cheaper and better. The yarn is twisted by being rolled in a peculiar manner in the hands, the work being done by natives during the rainy season. The yarn is first bleached and then sorted into colors. The process of weaving is an arduous one, and the looms are peculiarly constructed for the purpose and very strong. The fibre and grass rugs are usually woven like a rag carpet, with the coarse filling of fibre tied together by a slender cotton warp. Such rugs are often dyed or decorated in patterns by painting.

In the United States the industry classed by the Census Bureau as mats and matting includes the manufacture of doormats, floor mattings, art squares, rugs, and carpets, of which the principal materials are grass and coir yarn. These various products are woven with cotton warp, or plaited, and differ from rugs and carpets made in the carpet factories and in establishments engaged primarily in the manufacture

of cordage, twine, jute, and linen goods, in that their chief material is not wool, cotton, or jute. The progress of the industry in the United States as classified above is shown in the accompanying table.

YEAR	Number of establishments	Wage earners (average number)	Wages	Cost of materials	Value of products	Value added by manufacture
1909	12	937	\$385,434	\$1,066,566	\$2,431,615	\$1,365,049
1904	12	625	249,104	574,168	1,242,996	668,828
1899	9	1,197	237,282	516,137	1,165,330	649,193
1889	24	383	172,874	301,591	608,625	307,034
1879	12	285	125,129	233,707	439,370	205,663

In 1914 the imports of mats and mattings for floors, comprising coir fibre, rattan, straw, etc., amounted to 25,370,152 square yards, valued at \$2,097,009. In 1909 these amounts were 43,435,748 square yards and \$3,290,557, and in 1904, 50,025,490 square yards and \$3,609,795.

Consult *History and Manufacture of Floor Coverings* (New York, 1898).

MATTIPI, măt-tē'pê (South American name), or FROG SNAKE. A colubrine serpent (*Xenodon severus*) of northeastern South America, related to the hognoe, and one of many similar species of the opisthoglyph subfamily Xenodontinae. The snakes of this group are poisonous, although the enlarged posterior teeth which serve as fangs are solid and have no grooves for the transmission of poison from distinct venom glands. They are slow to bite, however, and in a healthy man the results are little more than local and temporary pain, swelling, and soreness.

MATTISON, HIRAM (1811-68). A clergyman of the Methodist Episcopal church. He was born at Norway, Herkimer Co., N. Y. He filled pastorates at Watertown and Rome, N. Y., and in 1852 removed to New York City, where he was pastor of John Street Church and afterward of Trinity Methodist Episcopal Church in Thirty-fourth Street, which he organized. He labored with great earnestness to persuade the General Conference in 1860 to take action against all slaveholding in the church, but, failing in this, he withdrew from the Methodist Episcopal church, Nov. 1, 1861, and became pastor of St. John's Independent Methodist Church, New York City. He returned in 1865 to the denomination that he had left, and was appointed to Trinity Methodist Episcopal Church in Jersey City. The last year of his life he was district secretary of the American and Foreign Christian Union. His books and contributions to the periodical press, both in prose and verse, were numerous, including among others: *Tracts for the Times* (1843); an improved edition of *Burritt's Geography of the Heavens* (1850); *Spirit-Rapping Unveiled* (1854); *Sacred Melodies* (1859); *Impending Crisis* (1859); *Immortality of the Soul* (1866); *Resurrection of the Body* (1866); *Defense of American Methodism* (1866); *Popular Amusements* (1867). He was widely known for his vigorous opposition to political Romanism. Consult his *Life*, by Vansant (New York, 1870).

MATTIUM. See CATTI; the first article HESSE.

MATTO GROSSO, măt'tô grôs'sô. A state of western Brazil, bounded by the states of Amazonas and Pará on the north, Goyaz, Minas Geraes, São Paulo, and Paraná on the east, and Paraguay and Bolivia on the south and west

(Map: Brazil, F 6). Its area is estimated at 532,683 square miles. Matto Grosso is the second in size among the states of Brazil and one of the least populated, having an average of one person to each two square miles. The northern half of

the state belongs to the great Brazilian plateau, and the southern is formed by lowlands, much of which is swampy and subject to inundations. There are a number of more or less isolated mountain ranges, including the Cordilheira dos Parecis, Serra Azul, Serra do Aguapehy, and Serra de Amambahy. Through the centre of the state runs the watershed which separates the drainage basins of the Amazon and La Plata rivers. The northern part of the state is drained by the Guaporé, Tapajoz, Xingu, Araguayas, and their tributaries, and the southern part by the Paraguay, Paraná, and their tributaries. Owing to the vast area of the state, climate shows considerable variation. The low, swampy depressions along the rivers have an extremely hot and unhealthful climate, while in the elevated plateaus it is more moderate and healthful, and the cool winds from the pampas sometimes reduce the temperature even to the freezing point. Agricultural land is found mainly in the valleys, while the plateaus afford good grazing. The chief industry is stock raising, together with some meat packing. The principal products are herba maté, rubber, and sugar cane. The cultivation of other agricultural products is chiefly for home consumption. The gold and diamond mines, once extensively exploited, are now abandoned. It is generally believed, however, that the mineral deposits of Matto Grosso are still very valuable. The civilized population of the state was, in 1900, only 118,025, many of whom were of mixed race, and it is estimated that there are still about 25,000 uncivilized Indians belonging to various tribes. In 1913 the total population was estimated at 300,000. The commercial centre of the state is Corumbá (pop. 30,000), on the Paraguay, and the capital is Cuyabá (q.v.). This region was not occupied by the Portuguese until the eighteenth century, the captaincy general of Matto Grosso having been organized in 1748.

MATTOLE, măt-tol'. A small Athapascan tribe in northern California.

MATTOON. A city in Coles Co., Ill., 170 miles south of Chicago, on the Cleveland, Cincinnati, Chicago, and St. Louis and the Illinois Central railroads (Map: Illinois, H 7). There are a Carnegie public library and reading room, the Methodist Hospital, and the Old Folks Home of the I. O. O. F. The city is the centre of a broom-corn district and carries on a considerable trade in broom corn, grain, live stock, and fruit. Among the industrial plants are repair shops of the Big Four and Illinois Central railroads, foundries and machine shops, engine works, broom factories, brick and tile works, carriage and wagon shops, flouring mills, grain elevators, and hay press. Settled and incorporated in

1855, Mattoon is governed under a revised charter of 1867, providing for a mayor, elected biennially, and a unicameral council which confirms the executive's nominations to the majority of administrative offices. The city owns and operates the electric-light plant and one of the water plants. This system furnishes water only for commercial purposes and comprises a 150-acre reservoir with a capacity of 500,000,000 gallons. Pop., 1900, 9622; 1910, 11,456; 1914 (U. S. est.), 12,218; 1920, 13,552.

MATURÍN, mǎ'tōō-rén'. The capital of the State of Monagas, Venezuela (Map: Colombia, E 2). It is situated on a savanna west of the Orinoco delta and 40 miles inland from the Gulf of Paria. It has a healthful climate, with an average temperature of 80.5° F. In the surrounding region stock raising and the cultivation of coffee, cacao, sugar cane, cereals, and fruits are carried on. There are manufactures of hammocks, hats, cigars, soap, and shoes. Maturín is connected by a highway with the port of Cumana and is the commercial centre of the plains west of the delta. Its trade is chiefly in cattle and hides. Pop., of the municipality, 1891, 15,624; urban, estimated 1915, 4358.

MATURIN, mǎt'ú-rín, CHARLES ROBERT (1782-1824). An Irish romancer and novelist, born in Dublin and educated at Trinity College. Maturin took orders in the Anglican church, became curate of St. Peter's, and is said to have been an eloquent preacher. He died Oct. 30, 1824. His novels comprise: *The Fatal Revenge* (1807); *The Wild Irish Boy* (1808); *The Milesian Chief* (1812); *Women* (1818), the author's idea of the working effects of Methodism on those who professed it; *Melmoth the Wanderer* (1820), an extravagant romance, marked by real power and fantastic diablerie, which made a stir in its day and by far Maturin's most notable book; *Albigenses* (1824). In these novels he essayed chiefly the supernatural romance of the Radcliffe school, though attempting also the portrayal of manners of his own or an earlier day, as in *Women* and *The Milesian Chief*. Maturin wrote plays, of which *Bertram*, produced by Kean at Drury Lane, May 9, 1816, ran for 22 nights. The others either failed or were less successful. Consult *Melmoth*, edited with memoir and bibliography (London, 1892).

MATY, mǎ'té, MATTHEW (1718-76). An English writer and librarian, born at Montfort, near Utrecht, Holland, May 17, 1718. His father was a Protestant refugee from Provence, who had settled at Montfort as minister of the Walloon church there. Matthew was educated at the University of Leyden, where he graduated Ph.D. and M.D. in 1740. The next year he came to London and began practice as a physician, but he devoted much time to literature. In 1750 he started the *Journal Britannique* (suspended 1750), a bimonthly printed at The Hague. It gave in French an account of English literary news. This periodical brought Maty numerous acquaintances among men of letters. In 1751 he was elected to the Royal Society, of which he became secretary in 1765. After serving as an underlibrarian of the British Museum, he was appointed principal librarian in 1772. He died July 2, 1776. Maty helped Gibbon bring out the *Essay on the Study of Literature*, contributed to the *Philosophical Transactions* of the Royal Society, and published several independent books. His last work was the

Memoirs of the Earl of Chesterfield, completed by his son-in-law, Justamond, and published with Chesterfield's *Miscellaneous Works* (1777).

MATZENAUER, mǎt'sen-ou'ér, MARGARETHE (1881-). An Hungarian dramatic mezzo-soprano, born in Temesvar. From earliest childhood she moved in a musical atmosphere, her father being an orchestral conductor and her mother a dramatic soprano. She began her vocal studies with Mme. Neuendorff in Graz and then continued with Antonia Mielke and Franz Emerich in Berlin. Her début at Strassburg, in 1901, as Puck in Weber's *Oberon* resulted in a three years' engagement there. From 1904 to 1911 she was a member of the Royal Opera at Munich, appearing also in the Wagner festivals held at the Prinzregenten Theater and at Bayreuth. From her first appearance at the Metropolitan Opera House, in 1911, she established herself as one of the prime favorites of American opera goers. With a voice of rare beauty and power she combines more than ordinary histrionic ability and a queenly stage presence. The extraordinary range of her voice enables her to sing both soprano and contralto rôles. Her extensive repertory includes all the Wagnerian heroines. In 1912 she was married to the tenor Edoardo Ferrari-Fontana (q.v.).

MÄTZNER, mǎts'nér, EDUARD ADOLF FERDINAND (1805-92). A German philologist, born at Rostock and educated there, at Greifswald, and at Heidelberg. He taught in Gymnasias at Berlin and Bromberg and was director of the famous Luisenschule in Berlin (1838-92). His earlier labors included editions of Lycurgus (1836), Antiphon (1838), and Dinarchus (1842), but he is better known for his contributions to English and Romance philology. He wrote: *Syntax der neufranzösischen Sprache* (2 vols., 1843-45); *Altfranzösische Lieder* (1853); *Französische Grammatik* (1856; 3d ed., 1884); a very valuable *Englische Grammatik* (1860-65; 3d ed., 1880-85; Eng. trans., 3 vols., London, 1874); *Altenglische Sprachproben* (1867-69; with a partial vocabulary, to M, 1872). Consult *Englische Studien*, vol. xvii (Leipzig, 1893), and *Allgemeine deutsche Biographie*, vol. lii (ib., 1912).

MATZOON'. Milk in which lactic acid fermentation has been allowed to proceed only to a certain point, differing in this way from sour milk. It is often tolerated by irritable stomachs which will not retain milk or other fermented milk foods, as kumiss or kefir. It may be prepared by boiling milk and letting it cool to 100° F. A small amount of previously prepared matzoon is then added, and the mixture kept in a warm room for 12 hours; it is then placed on ice. See KUMISS.

MAUBEUGE, mó'bēzh'. A fortified town of the first class, France, in the Department of Nord, on both banks of the river Sambre, 23 miles east-southeast of Valenciennes (Map: France, N., K 2). It is well built and defended by nine forts on both banks of the Sambre. It has manufactures of iron bars, hardware, and marble. The town has an arsenal, a communal college, a commercial school, several old convents, a museum, and a public library. Pop. (commune), 1901, 20,826; 1911, 23,209. Maubeuge was captured by the Germans, after a heavy bombardment and siege lasting nearly a month, during the European War which began in 1914. See WAR IN EUROPE.

MAUCH, mouk, KARL (1837-75). A German

traveler and African explorer, born at Stetten, Württemberg. He went to South Africa in 1863, traveled through the Transvaal, and made an excellent map of it; discovered valuable gold fields in 1867, explored the diamond fields in 1870 and 1871, and in the latter year discovered the ruined city of Zimbabwe, in Mashonaland, which he identified with biblical Ophir. In 1872 he returned to Germany, where he became a railroad official. He wrote *Reisen im Innern von Südafrika, 1865-72* (1874) and contributions to *Petermanns Mitteilungen*. Consult the biography by E. Mager (Stuttgart, 1895), and *Allgemeine deutsche Biographie*, vol. lii (Leipzig, 1912).

MAUCH CHUNK, mək'chŭnk. A borough and the county seat of Carbon Co., Pa., 46 miles west by north of Easton, on the Lehigh River, the Lehigh Canal, and the Lehigh Valley and the Central of New Jersey railroads (Map: Pennsylvania, K 5). This town marks the passage of the river through precipitous mountains and forms the eastern gateway of a highly productive anthracite region. Its unique situation on the side of the mountain, from the Indian name of which it is named, and its picturesque surroundings, with a healthful climate, cause it to be much frequented as a summer resort. Nine miles west by south of the borough are the Summit Hill coal mines, which are celebrated as among the richest in the State. Another feature of interest here is a burning mine. The coal was formerly carried by means of a gravity railroad, called the Switchback, to Mauch Chunk, the cars being elevated by cable planes and returning by a similar road to the mines. This road is now used for tourists and excursions only, and the coal is transported through a tunnel to steam railroads in Panther Creek valley. Mount Pisgah and Mount Jefferson, both ascended by the road mentioned, Prospect Rock and Flagstaff Park, all reached by cars of the local electric railway, are points from which can be gained magnificent views of the Lehigh valley. These points are about 900 feet above Mauch Chunk and 1600 feet above sea level. The borough has a public library, the Dimmick Memorial Library, the Asa Packer Park, and the jail where a number of the notorious Molly Maguires (q.v.) were hung. Its business interests lie in a very extensive coal trade, and there are also foundries and machine shops, silk mills, and car shops. The government is administered by a burgess, elected every four years, and a unicameral council. Mauch Chunk was founded in 1818 by the Lehigh Coal and Navigation Company and rapidly became a railroad and coal-shipping centre. Pop., 1900, 4029; 1910, 3952.

MAUCHLINE, mək'lin. A town in Ayrshire, Scotland, on the Ayr, 10 miles south of Kilmarnock. It is surrounded by a picturesque country and is famous because Robert Burns for four years lived at the farm of Mossiel, about 1½ miles to the north (Map: Scotland, D 4). The scenes of some of his most admired lyrics are in the neighborhood; the cottage of Poosie Nancy, theatre of the Jolly Beggars, and Mauchline Kirk, the scene of the Holy Fair, are in the town. It is a good horse and cattle market and makes cabinetwork and curling stones. Pop. (civil parish), 1901, 2572; 1911, 2441.

MAUCLAIR, mō'klār', CAMILLE (1872-). A French poet, critic, and novelist, born in Paris. A man of remarkable versatility, he

tried his hand at poetry, the novel, literary criticism, art and social criticism, politics, the drama, and metaphysical studies. The result of unconcentrated effort is a lack of unity in his work, although Maclair, possessing great power of reaction, is at least intensely modern. In 1905 he became Knight of the Legion of Honor. After 1903 he devoted himself mainly to art criticism. He contributed to a great many reviews and wrote short stories for *Le Journal*. His works include: *Eleusis, causeries sur la cité intérieure* (1893); *Sonates d'automne* (1894), poems; *Couronne de clarté* (1895), a novel; *Les clefs d'or* (1896), stories; *L'Orient vierge* (1897); *L'Ennemie des rêves* (1899); *Les mères sociales* (1902); *Les Danaïdes* (1903); *La ville lumière* (1904); *Ames bretonnes* (1907); *L'Amour tragique* (1908)—all novels. Among his essays are: *L'Art en silence* (1900); *Gustave Ricard* (1902); *Idées vivantes* (1904). His later poems are found in *Le sang qui parle* (1904); his art criticism in *The Great French Painters* (1903); *L'Impressionnisme* (1904); *Auguste Rodin* (1905); *J. B. Greuze* (1905); *De Watteau à Whistler* (1905); *Trois crises de l'art actuel* (1906); *La religion et la musique* (1909); *Les passionnés* (1911); *De l'amour physique* (1912).

MAUD, EMPRESS. See MATILDA (1102-67).

MAUDE, AYLMER (1858-). An English author. He was educated at Christ's Hospital, London, and in the Lyceum at Moscow, where he lived from 1874 to 1897, being a tutor for three years, then a clerk, and after 1885 manager of carpet factories. In 1898 he aided the Doukhobor migration to Canada. His mother was of an old Quaker family. His wife, Louise Shanks, was born in Russia, her father being English. Maude and his wife were intimate friends of Tolstoy, whose essays, letters, plays, and tales they translated into English. He wrote, besides, *Tolstoy and his Problems* (1901), *A Peculiar People, the Doukhobors* (1904), and a two-volume authorized *Life of Tolstoy* (1908-10), which was revised by the Countess Tolstoy.

MAUDE, CYRIL (1862-). An English actor and theatrical manager, born in London and educated at the Charterhouse. At an early age he began to prepare himself for the English stage, but ill health drove him to Canada. Later he came to the United States, where in 1883 he made his first appearance at Denver, Colo., playing the servant's part in *East Lynne*. He returned to London the following year and in 1886 appeared there in *The Great Divorce Case*. He made his first popular success as the Duke of Courtland in *Racing* at the Grand Theatre, Islington, in 1887. During the next five years he appeared in a great variety of rôles, and his rise to prominence was fairly rapid. In 1892 he joined Henry Arthur Jones's company at the Avenue Theatre and created the rôles of Polson and Juxton Prall in *The Crusaders* and *Judah* respectively. He played Cayley Drummle in the notable production of Pinero's *The Second Mrs. Tanqueray* at the St. James's, May 27, 1893. From 1896 till 1905 he was joint manager of the Haymarket, where he produced and played in many of the best-known plays of this period, *The Little Minister*, *The Manœuvres of Jane*, *The Second in Command*, and *Cousin Kate*, all being brought out there during his management. After leaving the Haymarket he acquired the old Avenue Theatre, which he rebuilt and called the Playhouse. He and his company, except for short intervals, occupied this house after 1907.

In 1913-14 he visited America again and met with popular favor in a repertory of his former successes and a new play called *Grumpy*, in the title rôle of which he achieved a great personal triumph. He came to be regarded as the leading English comedy actor of his time. Consult Maude, *The Haymarket Theatre, Some Records and Reminiscences* (London, 1903).

MAUDE, FREDERIC NATUSCH (1854-). An English writer on military subjects. He was educated at Wellington College and at Woolwich and entered the Royal Engineers in 1873. He was promoted to colonel and in 1905 was made Companion of the Bath. One of the small group of English army officers who pursued intelligent and valuable studies on the art of war, Colonel Maude wrote: *Letters on Tactics and Organization* (1891); *Military Letters and Essays* (1895); *Cavalry versus Infantry* (1896); *War and the World's Life* (1907); *The Leipzig Campaign, 1813* (1908); *The Jena Campaign, 1806* (1909); *The Ulm Campaign, 1805* (1912).

MAUD MUL'ER. A poem by John G. Whittier which appeared in the *National Era*, December, 1854.

MAUDSLEY, mädz'li, HENRY (1835-1918). An English alienist and psychologist, born at Rome, near Settle, Yorkshire. He studied at University College, London, where he graduated in medicine in 1857. In 1859-62 he was medical superintendent at the Manchester Royal Lunatic Hospital, in 1869-79 professor of medical jurisprudence at University College, London, and in 1864-74 physician to the West London Hospital. He was made a fellow of the Royal College of Physicians in 1869 and served as Gulstonian lecturer in 1870. He edited the *Journal of Medical Science* from 1862 to 1878. Edinburgh gave him the degree of LL.D. in 1884. His best-known works are: *Body and Mind* (1870; 2d ed., 1873); *Responsibility in Mental Disease* (1874); *Physiology of Mind* (1867, 1876); *Pathology of Mind* (1867; 2d ed., 1895); *Body and Will* (1883); *Natural Causes and Supernatural Seemings* (1886; 3d ed., 1897); *Life in Mind and Conduct* (1902); *Heredity, Variation, and Genius* (1908).

MAUER JAW. See MAN, SCIENCE OF, Ancient Types.

MAUI, mä'oo-ë. One of the Hawaiian Islands (q.v.).

MAULE, mou'lä. A river of Chile, rising in the Andes 7218 feet above the sea. After flowing 140 miles in a westerly direction it empties into the Pacific Ocean about 100 miles north of Concepción and near Constitución (Map: Chile, E 5). It is navigable for 52 miles for small craft. It formed the north boundary of the territory of the Araucanians. Its upper course is used for irrigation.

MAULE. A maritime province of Chile, bounded by the Province of Talca on the north, Linares and Nuble on the east, Concepción on the south, and the Pacific on the west (Map: Chile, E 5). Area, 2475 square miles. A large portion of the surface is occupied by the Coast Range, which is well wooded and rises to an altitude of nearly 3000 feet. It has a temperate climate and abundant rainfall, but the soil is rather poor. The chief occupations are stock raising and agriculture. A branch railway line from Parral runs through the province and terminates at the port of Chanco on the coast. Pop., 1911 (est.), 117,324. The chief port is Constitución (pop., 8873). The capital is

Cauquenes, situated on the railway line and having a population of 9683.

MAULMAIN, mal'män', or MOULMEIN, möl'män'. A seaport town, capital of the Amherst district and of the Tenasserim division of Lower Burma, at the junction of the rivers Salween and Attaran, 28 miles from the Bay of Bengal (Map: Burma, C 3). The town lies between the left bank of the river Salween and a fine range of densely wooded hills which, at a distance of from 1 to 6 miles, runs parallel with the river. Maulmain is one of the most beautiful and healthful towns of India; the mean annual temperature is 78° F., the highest mean for any month being 83° F. in April and the lowest 75° F. in January. The principal street extends for 4 miles along the river, while nearer to the hills, around the town, are the residences of Europeans and wealthy Burmese and numerous pagodas with gilded spires. The hills command an extensive view of beautiful and varied scenery. Martaban lies on the opposite river bank to the north. The native houses, built of bamboo and thatched with palm leaves, are raised on piles 10 or 12 feet from the ground. The principal buildings, besides three pagodas on the hills with an excellent view, include a public library, government offices, the new jail, a general hospital, and substantial barracks. There are several educational and charitable institutions, missionary establishments, and churches. Vessels of 10-foot draft reach the wharves and jetties at all states of the tide; at spring tide, when the rise and fall is from 20 to 23 feet, the town is accessible to vessels of the largest tonnage. A considerable trade is carried on, chiefly with Calcutta, Madras, Rangoon, and Penang. The chief industries are the manufacture of lumber, ironwork, gold and silver work, and carved ivory. The principal exports are timber, rice, cotton, horns, hides, ivory, wax, gums, drugs, lead, and copper; the imports are chiefly cotton and woolen piece goods, hardware, provisions, general merchandise, and—omitting timber, which is obtained from the neighboring teak forests—all the materials required for ship-building, which is an important industry. The United States is represented by a consular agent. The town dates from the British occupation of Tenasserim in 1826. The town owns its water, gas, and drainage systems. Pop., 1901, 58,446; 1911, 57,582, consisting, besides Burmese, of Hindus, Malays, Europeans, Eurasians, Chinese, Armenians, and Jews.

MAUMEE (mä-më') RIVER. A river formed at Fort Wayne, Ind., by the junction of the St. Joseph and the St. Mary's rivers, flowing northeast through the northwestern part of Ohio. Its length is 150 miles, and it empties through Maumee Bay into Lake Erie at its western extremity (Map: Ohio, C 3). The city of Toledo (q.v.) stretches along its banks for 4 miles from its mouth, and the river is navigable for 12 miles to the Maumee Rapids, above which its course is followed as far as Defiance by the Miami and Erie Canal, connecting Lake Erie with the Ohio River. The chief tributaries of the Maumee are the Auglaize and Tiffin rivers, and its drainage area is 6723 square miles. Maumee Bay is for the most part shallow, but its channel has been deepened, straightened, and marked by lighthouses.

MAUNA KEA, mä'oo-nä kă'a (Hawaiian, white mountain). The highest mountain in Polynesia. It is an extinct volcano occupying

the north and north-central portions of Hawaii, and its height is 13,805 feet (Map: Hawaii, F 4). During most of the year snow lies on its peaks, which are composed of gravel and reddish scoria. Its sides are covered with forests nearly to the summit; the lower slopes are being brought under cultivation in coffee orchards.

MAUNA LOA, lō'ā (Hawaiian, long mountain). The largest volcano in the world (though not the loftiest), occupying much of the central and south portion of Hawaii (Map: Hawaii, F 4). It is 13,760 feet in height and slopes gradually from the sea to the summit near the centre of the island, where the group of craters forms an immense caldron $1\frac{1}{2}$ miles in diameter and 1000 feet deep, known as Mokuaweoweo. It exceeds by far any other volcano in the amount of lava discharged; the last great eruption (1880-81) sent a stream down the east slope 50 miles long and in some places 3 miles wide. The crater is in almost continuous activity, and large eruptions have been frequent during the past century. On the east slope is the large crater of Kilauea (q.v.).

MAUNCH. See MANCH.

MAUND. See INDIA, *Weights and Measures*.

MAUNDER, mān'dēr, SAMUEL (1785-1849). An English compiler, born in Devonshire. His first literary work was in connection with the *Catechisms* (1837-49), published by his brother-in-law and partner, William Pinnock, with whom he was associated also in the *Literary Gazette* of London. Among his numerous compilations are: *The Little Lexicon* (1825); *Treasury of Knowledge* (1830); *Biographical Treasury* (1838); *Scientific and Literary Treasury* (1841); *Treasury of History* (1844); *Treasury of Natural History* (1848); *Treasury of Geography* (1856)—most of which passed through many editions.

MAUNDEVILLE, mān'de-vil, SIR JOHN. See MANDEVILLE, THE TRAVELS OF SIR JOHN.

MAUNDRELL, mān'drel, HENRY (1665-1701). An English traveler. He graduated in 1685 at Exeter College, Oxford, and was curate at Bromley, Kent, from 1689 to 1695. In the latter year he was appointed chaplain to the English factory at Aleppo, Syria. He wrote *A Journey from Aleppo to Jerusalem* (1703), a valuable work often reprinted, and translated into French, German, and Dutch.

MAUNDY THURSDAY. The Thursday preceding Good Friday, also called Holy Thursday. The origin of the name is in doubt. It is referred to the Latin *dies mandati*, the day of the mandate: "A new commandment give I unto you, that ye love one another" (St. John xiii. 34); to the old *mande*, a hand basket, from which food was distributed to the poor on the day before Good Friday; and to the phrase *Accipite et manducate*, "Take and eat," occurring in the Epistle for the day in the Roman Catholic church (1 Cor. xi. 24).

MAUNOURY, mō'nōō'rē', MICHEL JOSEPH (1847-). A French soldier, born at Mainton, Eure-et-Loir. He was educated at the Ecole Polytechnique, Paris, and served in the Franco-Prussian War of 1870 as an under lieutenant, being wounded in the battle of Champigny. He studied at the Ecole Supérieure de Guerre and in 1886-88 was an instructor in artillery at Saint-Cyr. He was regularly promoted, becoming colonel in 1897, general of brigade in 1901, and general of division in 1905. In the latter year he received command of the artillery of the

forts of Paris and became president of the commission of military schools; in 1907 he was commandant of the Ecole Supérieure de Guerre; he commanded the 15th Army Corps at Marseilles in 1908 and the 20th at Nancy in 1909; and in 1910 was named military governor of Paris and a member of the Superior Council of War. At the beginning of the War in Europe (q.v.) in 1914, Maunoury was placed in command of the French reserve force near Paris, and it was his successful attack on September 6 that first checked General Von Kluck's drive towards Paris. He later commanded at Soissons, and in March, 1915, was severely wounded. He became an Officer of the Legion of Honor, and in 1915 President Poincaré conferred on him the highest French military honor, the *médaille militaire*.

MAUPASSANT, mō'pā'sān', HENRI RENÉ ALBERT GUY DE (1850-93). A French novelist, one of the greatest modern writers of short stories. He was born at the Château de Miromesnil (Seine-Inférieure), Aug. 5, 1850. After serving in the Navy Department as clerk, and as soldier in the Franco-Prussian War, Maupassant was slowly initiated into the craft of storytelling by Flaubert, an old friend of Madame de Maupassant. Restraint ripened his genius, and his first story, *Boule de suif*, published in *Les soirées de Médan* in 1880, revealed a finished master of the naturalistic school. In the same year he published some striking but sensual poems, *Des vers* (1880), and a drama, *Histoire du vieux temps*, but he saw clearly that his career was elsewhere. He confirmed the promise of *Boule de suif* in about 200 tales gathered under the titles: *La maison Tellier* (1881); *Mademoiselle Fifi* (1883); *Contes de la Bécasse* (1883); *Clair de lune* (1883); *Les sœurs Rondoli* (1884); *Yvette* (1884); *Contes du jour et de la nuit* (1885); *Contes et nouvelles* (1885); *Le Horla* (1887); *La petite Roque* (1888); *La main gauche* (1889); *Le père Milon* (1899); and others, among them *L'Inutile beauté* (1890). Besides these he wrote six novels, *Une vie* (1883); *Bel-Ami* (1885); *Mont-Oriol* (1887); *Pierre et Jean* (1888); *Fort comme la mort* (1889); *Notre cœur* (1890); and several volumes of traveler's impressions, *Au soleil* (1884); *Sur l'eau* (1888); *La vie errante* (1890). *Œuvres complètes de Guy de Maupassant* (29 vols.) appeared in 1908-10, and in the latter year a good edition in English, with critical and interpretative essays, was published in New York (9 vols.). Numerous volumes of translated short stories are to be had. Traces of insanity appear at times in all the work from 1887 onward. The condition is most strongly marked in the longer novels. It caused a practical suspension of his literary work in 1890. In 1892 Maupassant became wholly insane. July 6, 1893, he died in an asylum at Passy. His whole work is a melancholy yet fascinating study in imaginative psychology. He begins as a playful satyr, yet with an aristocratic assumption of superiority to his fellow men that masked a pessimism as deep as Flaubert's. Year by year he loses the sensuous exuberance of youth, more and more he is, as it were, hypnotized by the ghastly fascinations of death, as were Villon, Gautier, and Baudelaire. The moral gloom deepens, the moral unrest grows. The robust animalism of *Une vie* becomes a melancholy moral anatomy in *Notre cœur*. In losing its sensuality it had become morbid and morally un-

certain even in *Pierre et Jean*, artistically Maupassant's best novel. The shorter stories, because requiring less sustained effort, show this less clearly. To the very end Maupassant did work of a character similar to his early work; but from *Le Horla* onward there are stories that could not be attributed to the earlier period. As a whole and in average excellence these stories are in style and art the best in France. There are stories of his native Normandy, tales of selfishness and meanness, chiefly tragic, occasionally comic, more often grim in their irony; there are stories, usually cynical, of Parisian foibles, of life in strange lands, of hunting, medical incident, of love, crime, horror, misery, all carefully elaborated and incredibly deft in the rapid portraiture of a scene or character. All is sharply individualized and the point of view is the absence of any moral law. Characteristic of Maupassant's good humor and better nature are *Le papa de Simon*, *Les idées du colonel*, *Miss Harriet*, *Mademoiselle Perle*, and *Clochette*; typical of his whimsical and satirical irony are *Le parapluie*, *Denis*, *Décoré*, *Aux bois*; bitterly satirical are *L'Héritage*, *La partie de campagne*, *Pain maudit*, *Maison Tellier*, *Hautôt père et fils*, and most exquisite of all this group, *Yvette*; more intensely misanthropic are tales of sordid brutality or wanton cruelty such as *En mer*, *L'Oncle Jules*, *Le diable*, *Coco*, *L'Âne*, *La fille de ferme*, or *Les sabots*, and it is to the wanton side of war that he directs attention in *La mère sauvage* and *Saint-Antoine*. Finally there are at least 40 stories that are pathologic in their pessimism. Nauseated horror of life and haunting terror of death are whispered in the stories of 1884 and recur with growing frequency and intensity, as will appear from consecutive reading of *Petit soldat*, *Solitude*, *Un fou*, *Lui*, *La petite Roque*, *Le Horla*, and *Qui sait*.

Mayniel, *La vie et l'œuvre de Maupassant* (Paris, 1907); P. Mahn, *Guy de Maupassant, sein Leben und seine Werke* (Berlin, 1908); P. H. Frye, "Maupassant in English," in *Literary Reviews and Criticisms* (New York, 1908); *Recollections of Guy de Maupassant*, by his Valet François, translated by Maurice Reynolds (ib., 1911).

MAUPEOU, mô'pōō', RENÉ NICOLAS CHARLES AUGUSTIN DE (1714-92). A French politician and Chancellor, born in Paris. Both his father and his grandfather had been President of the Parliament of France. He was made Councilor of Parliament, first President (1763), and finally succeeded his father, René Charles de Maupeou, as Chancellor of France in 1768. He presided over the famous Lally (q.v.) trial. He upheld the King in his plan to override the Parliament of Paris, and sided with Madame du Barry against the Duke of Choiseul. After the Duke's exile in 1770 he, the Duke of Aiguillon, and the Comptroller General, Abbé Terray, formed a triumvirate to suppress the power of Parliament. The Maupeou Parliament, as it was called, which was then formed, became very unpopular and Beaumarchais attacked it. Maupeou was forced

to live in retirement after the death of Louis XV. In 1789 he presented the nation with a patriotic gift of 800,000 livres. He wrote an account of his high-handed disruption of the Parliament, under the title *Code des parlements ou collection d'édits . . . depuis décembre 1770, jusqu'à décembre 1771* (1772). Consult Jules Flammarion, *Le Chancelier Maupeou* (Paris, 1883).

MAUPERTUIS, mô'pâr'twê', PIERRE LOUIS MOREAU DE (1698-1759). A French mathematician and astronomer, born at Saint-Malo. His education was begun under a tutor and in 1714 he went to Paris to the College of La Marche. In 1718 he joined the army and soon attained the rank of lieutenant. Having acquired a taste for mathematics, he resigned five years later and became *adjoint géomètre* in the Academy of Sciences at Paris and in 1725 *associé*. For the next seven years he devoted himself to the investigation of certain geometric problems, publishing his results in a series of memoirs. He was one of the first Frenchmen to master the teachings of Newton. He went to England in 1728 and was admitted to the Royal Society of London. The next year he returned to Basel and studied the integral calculus with Bernoulli. In 1736 he conducted the expedition for measuring a degree of the meridian in Lapland. The results of this work confirmed Newton's theory of the flattening of the earth at the poles. It was on his return that he became acquainted with Voltaire and Samuel König. In 1740 Frederick the Great called him to Prussia, and he accompanied the King in the campaign in Silesia. Having been taken prisoner by the Austrians at Mollwitz, Maupertuis was set free by Maria Theresa and returned to Paris. He was elected a member of the French Academy in 1743, but the next year he was again called to Prussia and in 1746 became president of the Academy at Berlin. In 1750 König came there as professor of philosophy, and he and Maupertuis were soon quarreling over the question of the discovery of infinitesimal calculus and of certain laws of which Maupertuis claimed to be the author. Voltaire sided with König and satirized Maupertuis severely. Frederick interposed in behalf of Maupertuis, but to no avail. The latter, broken in health and spirit, returned to France, and in 1758 went to Basel, where he died in a short time. Some of his chief works are: *Sur la figure de la terre* (1738); *Discours sur la parallaxe de la lune* (1741); *Discours sur la figure des astres* (1742); *Lettre sur la comète de 1742* (1742); *Astronomie nautique* (1745 and 1756); *Essai de cosmologie* (1750); *Maupertiana ou écrits divers* (Leyden, 1753). His collected works, in four volumes, were published in Paris in 1752 and again in Lyons in 1768, under the title *Œuvres complètes de M. de Maupertuis*. Consult: L. A. de la Baumelle, *Vie de Maupertuis* (Paris, 1856); J. P. Damiron, *Mémoires sur Maupertuis* (ib., 1858); id., *Mémoires pour servir à l'histoire de la philosophie du XVIIIe siècle*, vol. iii (ib., 1864).

MAUPRAT, mô'prâ'. A novel by George Sand (1836). A drama in six acts was made from the story by the author and presented at the Odéon in 1853.

MAURA Y MONTANER, mou'râ ê môn-tä'nér, ANTONIO (1853-). A Spanish statesman, juriconsult, and orator. Born in Palma of Majorca, he studied jurisprudence in the University of Madrid and became a member of the

Academia Matritense de Jurisprudencia y Legislación. As early as 1881 he was sent to Congress by his native city, which he continued to represent up to 1890, serving in 1885 as president of the Council of Ministers. After 1892 he represented Palma in the Cortes, serving as Minister of the Colonies 1892-93 (during which period he published a decree granting larger electoral and representative rights to the Antilles) and Minister of Justice in 1894. A fusionist with liberal tendencies up to 1899, he then turned conservative. On the fall of Silvela he became leader of the Conservatives, and was president of the Council of Ministers 1903 to 1904. During his term of office he accompanied the King on a tour through Cataluña and was stabbed by an anarchist in Barcelona. While he was again Prime Minister (from early in 1907 to late in 1909) occurred two cases of the utmost importance to Spain—the case of Francisco Ferrer and the Rif problem, accompanied by the rebellion in Barcelona. Maura y Montaner became director of the Royal Spanish Academy of the Language and a member of the Royal Academies of Fine Arts (San Fernando) and Moral and Political Sciences. Consult Antón del Olmet and García Carranza, *Los grandes Españoles*, vol. iii; *Maura* (Madrid, 1913).

MAUREL, mô'rêl', VICTOR (1848–). A French barytone singer, born in Marseilles. He was a pupil of the Marseilles and Paris conservatories and made his first appearance at the Opera House in Paris. Afterward he went to Italy and sang at the Scala in Milan. A tour through Europe and in America followed, and in 1879 he returned to Paris. In another visit to Paris after this date he attempted to revive Italian opera in company with the brothers Corti, but without success. His fine voice and talent as an actor caused him to be chosen by Verdi to create the rôles of Iago in *Otello* and Falstaff in *Falstaff*. In 1885 he began an extended tour, appearing in Italy, North and South America, and in 1893 and 1894 sang Verdi's famous rôles in Paris at the express desire of the composer. In 1898 he appeared at the Berlin Opera House. His best-known writings are *L'Art du chant*, *Le chant renové par la science*, and *Dix ans de carrière*.

MAURENBRECHER, mou'ren-brêk-êr, BERTHOLD (1868–). A German classical scholar, born at Dorpat. From 1878 to 1887 he studied at the Gymnasium at Bonn and at the Thomasschule in Berlin and in 1887-91 at the universities of Bonn and Leipzig. From 1891 to 1894 he was an assistant in the library of the University of Leipzig; from 1894 to 1906 privat-docent at Halle. Thereafter he resided at Munich, engaged on the great *Thesaurus Linguae Latinae*. (See *DICTIONARY, History*.) His writings include: *Sallusti Crispi Historiarum Reliquiae* (2 vols., 1891-93); *Carminum Saliorum Reliquiae* (1894); *Forschungen zur lateinischen Sprachgeschichte und Metrik*, i (1899); *Jahresbericht über Sallustius*, i, ii (1900, 1902); *Grundzüge der klassischen Philologie*, i, ii, iii (1908-12). The last-named work is the third edition of W. Freund's well-known *Triennium Philologicum*.

MAURENBRECHER, WILHELM (1838-92). A German historian, born in Bonn. He studied there, in Berlin, and in Munich, his great teachers being Ranke and Von Sybel, with whom he was associated on his *Historische Zeitschrift*. At Bonn he became docent in 1862. He spent a year at Simancas, Spain, in historical research,

and after his return to Germany was appointed professor at Dorpat (1867), at Königsberg (1869), at Bonn (1877), and at Leipzig (1884). From 1881 to 1892 he edited the *Historisches Taschenbuch*. He wrote *England im Reformationszeitalter* (1866); *Studien und Skizzen zur Geschichte der Reformationszeit* (1874); *Die katholische Reformation* (1880); *Geschichte der deutschen Königswahlen vom 10. bis 13. Jahrhundert* (1889); *Gründung des deutschen Reiches 1859-1871* (1892). Consult Wolf, W. *Maurenbrecher: ein Lebens- und Schaffensbild* (Berlin, 1893), and *Allgemeine deutsche Biographie*, vol. lii (Leipzig, 1912).

MAUREPAS, mô're-pâ', JEAN FRÉDÉRIC PHÉLIPPEAUX, COUNT (1701-81). Minister of State in the reigns of Louis XV and Louis XVI of France. He was born at Versailles. The office of Minister of State had been held by his father, who on resigning in 1715 transferred it to his 14-year-old son. It was administered during his minority by the Marquis de Villière, his future father-in-law. Maurepas became Minister of Marine in 1725 and Secretary of State in 1738. He made some attempts towards restoring the efficiency of the navy by establishing naval academies and introducing scientific methods of instruction. A satirical couplet against Madame de Pompadour brought about his disgrace in 1749, and he was exiled from court until the death of Louis XV. When Louis XVI came to the throne in 1774 Maurepas was recalled and became his Prime Minister. Without striking ability of his own, he displayed great wisdom in the selection of the members of his council, Vergennes being made Minister for Foreign Affairs, Turgot Comptroller General, and Malesherbes Minister of the Royal Household. He supported Vergennes in the alliance with the United States and in the declaration of war against England. He belonged in spirit nevertheless to the old régime, and in alarm at Turgot's wide-reaching plans of reform he helped to bring about that minister's downfall in 1776, whose place was taken by Necker, who in turn was dismissed in May, 1781. Maurepas held his place as chief minister of the crown until his death, which took place at Versailles, Nov. 21, 1781. Memoirs of a curious nature were published under his name (4 vols., Paris, 1790-92), but were really largely the work of his secretary. The *Bibliothèque Nationale*, however, contains a voluminous collection of French *chansons* made by him. Consult J. L. G. Soulavie, *Mémoires* (3d ed., Paris, 1792).

MAURER, mou'rêr, GEORG LUDWIG VON (1790-1872). A German statesman and jurist, born near Dürkheim in Bavaria. He was educated at Heidelberg and Paris. In 1824 his *Geschichte des altgermanischen Gerichtsverfahrens* was crowned by the Academy of Munich, and he was appointed professor of jurisprudence in the university (1826). From 1832 to 1834, during the minority of King Otho of Greece, he was a member of the Council of Regency, his energy and ability accomplishing a complete reorganization of civil procedure. In 1847 he was Bavarian Minister of Foreign Affairs and Justice. The most valuable of his various works on history and jurisprudence are: *Das griechische Volk . . . vor und nach dem Freiheitskampfe bis zum 31. Juli 1834* (1835-36); *Geschichte der Dorfverfassung in Deutschland* (1865-66); *Geschichte der Städteverfassung in Deutschland* (1869-71).

MAURER, KONRAD VON (1823-1902). A German jurist, son of Georg Ludwig von Maurer. He was born at Frankenthal, Bavaria; studied at Munich, Leipzig, and Berlin; and in 1847 was appointed extraordinary professor, and in 1855 professor, of northern jurisprudence at Munich. He made an especial study of Icelandic language, literature, and history. In connection with these subjects he published: *Die Entstehung des isländischen Staates und seiner Verfassung* (1852); *Die Bekehrung des norwegischen Stammes zum Christentum* (2 vols., 1855-56); *Inseln von seiner ersten Entdeckung bis zum Untergang des Freistaats* (1874); *Zur politischen Geschichte Islands* (1880); *Nogle bemærkninger til Norges kirkenhistorie* (Christiania, 1893). He also edited *Gull-Thóris-Saga* (1858) and a collection of legends entitled *Isländische Volkssagen der Gegenwart* (1860). A catalogue of his library (2 vols.) was published at Munich the year following his death. For a more complete biography and critical estimate of his work, consult his obituary by Golther in the *Zeitschrift für deutsche Philologie*, vol. xxxv (Halle, 1903).

MAURETANIA, or **MAURITANIA** (Lat., Gk. *Μαυροβία*, *Maurousia*, from *μαύρος*, *mauros*, black). The ancient name of the most north-western part of Africa (Map: Rome, B 3). It was so called from the Mauri or Maurusii, a general designation for its numerous tribes. At the time of its greatest expansion it included the present Morocco and more than two-thirds of Algeria, extending from the Atlantic to the Amsaga River (Wady el Kebir). Among the kings of Mauretania were Bocchus I, the father-in-law of Jugurtha, Bocchus II, who espoused the cause of Caesar against the Pompeians, for which his territory was considerably enlarged, and Juba II, the son of the Pompeian partisan Juba I of Numidia. Under the Emperor Claudius it was made a Roman province and divided into Mauretania Cæsarensis and Mauretania Tingitana, separated by the Mulucha (Muluya) River. The country was noted for its extraordinary fertility, and its upland plains, stretching from the Atlas Mountains to the sea, supplied Italy with grain. From the hands of the Romans it passed in succession to the Vandals, the Byzantines, and the Arabs. Consult *Cambridge Medieval History*, vol. ii (New York, 1913). See **BARBARY STATES**.

On Oct. 18, 1904, the Civil Territory of Mauretania (Fr. *Mauritanie*) was organized as a part of the Government General of French West Africa. This territory extends from the French colony of Senegal (separated therefrom by the Senegal River) along the Atlantic to the Spanish colony of Río de Oro; thence it stretches north-eastward, in which direction its boundary is not definitely determined; eastward of its southern part lies the French colony of Upper Senegal and Niger. Mauretania comprises a large part of the western Sahara and embraces the mountainous regions of Tagant and Adrar (the latter not to be confused with the region known as Adrar in the Military Territory of the Niger). For the most part Mauretania is a low-lying country of sandy plains or dunes, with no permanent streams. As the northeast boundary is not fixed, the area can be estimated only arbitrarily. This is stated at 893,700 square kilometers (about 345,000 square miles). The number of inhabitants is unknown, and estimates appearing in contemporary official publications

vary greatly; e.g., the French *Annuaire statistique*, published in 1913, places the population at 225,000, whereas *Annuaire*s of the Government General of French West Africa, published both before and after that date, place it at about 600,000. In the south a strip of country from 6 to 25 miles broad bordering the Senegal River is rendered fertile by numerous pools, and here some cultivation, especially of millet, is carried on by the negro inhabitants. These people are of the same races as those in Senegal—Yolofs, Peuhls, Toucouleurs, Sarakolés, who dwell in villages along the river. The bulk of the population is Moorish, being a mixture of Arabs and Berbers. With the exception of palm-tending groups, the Moors of Mauretania are mostly nomads, engaged principally in grazing. They are all Mohammedans, many of them Sufistic. The principal towns or villages include Port-Etienne, Boutlimit, Aleg, Moudjeria, Kaedi, Atar, Selibaby, Tidjikdja, etc. Trade, carried on by caravan, is largely in the nature of barter. Mauretania is administered by a commissioner, resident at Saint-Louis in Senegal. Pillaging bands are not uncommon in the territory, and there have been numerous minor uprisings.

MAURI. See **MAURETANIA**; **MOORS**.

MAURICE, *mā'ris* (FLAVIUS TIBERIUS MAURICIUS) (c.539-602). Byzantine Emperor from 582 to 602. He was descended from an ancient Roman family. During the reigns of Justin II and Tiberius II Maurice was in the military service and in 578 was appointed by the latter Emperor to the command of the army sent against the Persians. In 582 he obtained the rare honor of a triumph at Constantinople, became the son-in-law of Tiberius II, and in August of the same year succeeded him on the throne. Immediately after his accession the Persians invaded the Byzantine territories; a fierce contest of nine years' duration ensued, which, chiefly owing to the internal convulsions that distracted Persia, resulted in favor of the Byzantines. The King of Persia, Khosru II (q.v.), driven from his throne, fled to the Byzantines; an army was immediately assembled, and in 591 Khosru was restored to his throne, giving up to Maurice the fortresses of Daras, Martyropolis, and Persarmenia. In 599 the Avars demanded ransom money for 12,000 soldiers whom they held as prisoners. The Emperor refused to ransom them and they were consequently put to death. This excited a deep resentment in the army, and in 602, when the Emperor ordered his troops to take up their winter quarters on the north side of the Danube, they broke out into open revolt, proclaimed Phocas Emperor, and marched upon Constantinople. Maurice with all his family and many of his friends was put to death on Nov. 27, 602. Consult J. B. Bury, *Later Roman Empire* (New York, 1899), and Edward Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury (London, 1912).

MAURICE, Prince of Orange and Count of Nassau, commonly styled Maurice of Nassau (1567-1625). Stadholder of the Netherlands, and one of the distinguished generals of his age. He was the son of William the Silent, founder of the Dutch Republic, and was born at Dillenburg in Nassau in 1567. After the assassination of his father in 1584 the provinces of Holland and Zealand, and later Utrecht, elected him their stadholder (1590). He was also President of the Council of State. A great portion of the Netherlands was still in the hands

of the Spaniards; and though during the first part of his administration he was unsuccessful, later Maurice rapidly wrested cities and fortresses from the enemy. In 1591 Zutphen, Deventer, Nimeguen, and other places fell into the hands of the Dutch; in 1593 Gertruydenberg and in 1594 the Province of Groningen. In 1597, with the help of some English auxiliaries, Maurice defeated the Spaniards at Turnhout in Brabant and in 1600 won a splendid victory at Nieuwport. In 1604, however, Ostend, after a siege of three years, surrendered to the Spaniards. Finally in 1609 Spain agreed to a truce of 12 years, which meant the practical achievement of their independence by the Dutch. In 1621 the struggle was renewed. Maurice from political motives was the bitter enemy of Barneveldt (q.v.), whose death he caused. This is the only stain on his memory. Consult: G. Groen van Prinsterer, *Maurice et Barneveldt* (Utrecht, 1875); M. O. M. Nutting, *The Days of Prince Maurice* (Boston, 1894); J. L. Motley, *Life and Death of John of Barneveldt* (2 vols., New York, 1902).

MAURICE, Duke and Elector of Saxony (1521-53). He was the eldest son of Duke Henry the Pious of the Albertine line. He was born at Freiburg, March 21, 1521, married in 1541 Agnes, daughter of the Landgrave Philip of Hesse, and later in the same year succeeded his father in the Duchy of Saxony. He was early involved in disputes with his cousin, the Elector John Frederick of the Ernestine line. Though a Protestant, he did not join the Schmalkalden League (q.v.), and was finally won over by the Emperor Charles V, who, preparing to crush German Protestantism by force of arms, promised him (June 19, 1546) the possessions of the Ernestine line and the electoral dignity as soon as John Frederick, who was one of the leaders of the League, should be dispossessed. He invaded electoral Saxony (1546), but was driven from it and from his own domains, and only saved by the timely assistance of the Emperor and the Duke of Alva, who at the battle of Mühlberg (1547) annihilated the army of the Schmalkalden League and took John Frederick prisoner. Maurice now became ruler of the whole of Saxony, with the electoral dignity. The imprisonment of Philip of Hesse, whom Maurice had prevailed upon to submit to the Emperor, was the first cause of estrangement between Charles and Maurice. The attempts of the Emperor to increase his own preponderance supplied another; a further source of trouble was the refusal of the Emperor to hand over to Maurice the episcopal territories of Magdeburg and Halberstadt, the prospect of whose possession had been held out to him; in addition Maurice was alarmed for the safety of Protestantism. The new Elector gradually came to see that his close alliance with the Emperor was alienating from him the affections of his Protestant subjects. He accordingly abandoned the cause of the Emperor with as little scruple as he had formerly sacrificed the interests of his relatives and coreligionists, and arranged an alliance against Charles V, comprising a number of German princes and Henry II of France, to whom the bishoprics of Metz, Toul, and Verdun were promised as a reward for his assistance. In March, 1552, Maurice suddenly appeared with an army in south Germany and compelled the Emperor, who was then at Innsbruck, to take refuge in flight, leaving to his

brother Ferdinand the conduct of negotiations. Finally, at a convocation of the electors and princes of the Empire at Passau, the terms of a treaty of peace were arranged, in which it was agreed that the Lutheran states should be free to maintain their mode of worship. In the summer of 1553 Maurice took the field against Albert, Margrave of Brandenburg-Culmbach, who had refused to accede to the terms of the Treaty of Passau and was raiding the Rhine bishoprics and Franconia. He was fatally wounded in the battle at Sievershausen, July 9, dying July 11. Although but 32 years of age, he had established his reputation as one of the ablest diplomats, administrators, and generals of his time; but he united with a most agreeable personality a dissimulation and bad faith which lost him the confidence of both parties.

Issleib, "Moritz von Sachsen als protestantischer Fürst," a short study in *Sammlung gemeinverständlicher wissenschaftlicher Vorträge* (Hamburg, 1898); *Cambridge Modern History*, vol. ii (Cambridge, 1904), containing a bibliography. His *Politische Korrespondenz* was published by E. Brandenburg (Leipzig, 1900-04). See REFORMATION; SAXONY.

MAURICE, mǝ'ris, ARTHUR BARTLETT (1873-). An American editor, born at Rahway, N. J., and educated in Paris, at Richmond College (Va.), and at Princeton. He served as an editor of the Woodbridge (N. J.) *Register* in 1895, as city editor of the Elizabeth (N. J.) *Daily Herald* in 1896, and as special writer for the New York *Commercial Advertiser* in 1897-98. Of the *Bookman* he was joint editor from 1899 to 1909 and editor thereafter. He contributed to the NEW INTERNATIONAL ENCYCLOPEDIA and is author of *New York in Fiction* (1901) and *History of the Nineteenth Century in Caricature* (1904), with F. T. Cooper.

MAURICE, (JOHN) FREDERICK DENISON (1805-72). An English author and divine, born at Normandston, the son of a Unitarian clergyman. He studied at Cambridge and became engaged in literary work in London. Influenced by Coleridge and others, he decided to become a clergyman in the Established church. He went to Oxford and took his M.A. degree and was ordained in 1831. His first position was the curacy of Buddenhall. In 1836 he became chaplain of Guy's Hospital, London; in 1840 professor of history and English literature at King's College and in 1846 of divinity in this school, losing these last positions in 1853 because of his supposedly radical religious views. He was chaplain of Lincoln's Inn, 1846-60; incumbent of St. Peter's, Vere Street, London, 1860-69; professor of moral philosophy at Cambridge from 1860 until his death, which occurred in London, April 1, 1872. At the time of his death there was probably no clergyman in England more deeply revered and loved by the people, and within the Church he had become the head of the Broad Church party and had a large following among the younger men. He founded the Working Men's College in London in 1854 and became its principal. He wrote one novel, *Eustace Conway* (1834). Other works are: *The Kingdom of Christ* (1838); *Religions of the World* (1847); *Moral and Metaphysical Philosophy* (1850-57); *Prophets and Kings of the Old*

Testament (1853); *Unity of the New Testament* (1854); *Ecclesiastical History of the First and Second Centuries* (1854); *Patriarchs and Lawgivers of the Old Testament* (1855); *Epistle of St. John* (1857); *The Word Eternal* (1863); *Conscience* (1868); *Social Morality* (1869). Consult: Sir J. Frederick Maurice, *Life of F. D. Maurice, chiefly Told in his Own Letters* (2 vols., New York, 1884); C. F. G. Masterman, *Frederick Denison Maurice* (London, 1907); also R. H. Hutton, in *Essays on Some of the Modern Guides of English Thought in Matters of Faith* (New York, 1887); F. M. Brookfield, in *Cambridge Apostles* (ib., 1906).

MAURICE, SIR JOHN FREDERICK (1841-1912). An English soldier, born in London. He studied at Addiscombe College and Woolwich Academy and entered the Royal Artillery in 1861. He was private secretary to Sir Garnet Wolseley in the Ashanti campaign of 1873-74; served in the Zulu War in 1880; was deputy assistant adjutant general of the Egyptian expedition in 1882; and was brevetted colonel in 1885. In 1885-92 Maurice was professor of military history at the Staff College and in 1895 he was promoted to major general. His reputation depends chiefly on his military writings, which include: *Hostilities without Declaration of War* (1883); *Popular History of Ashanti Campaign* (1874); a life of his father, Frederick Denison Maurice (1884); *The Balance of Military Power in Europe* (1888); *War* (1891); *National Defenses* (1897); *Diary of Sir John Moore* (1904); an official *History of the War in South Africa, 1899-1902* (4 vols., 1906-10).

MAURICE, SAINT. See LEGION, THEBAN.

MAURICE, THOMAS (1754-1824). An English scholar and historian, born at Hertford. He was a pupil of Dr. Parr in an academy at Stanmore and afterward entered St. John's College, Oxford, but the next year removed to University College, where he graduated in 1773. Appointed curate of Woodford in Essex, he resigned in 1785 for a pastorate at Epping. In 1798 he was appointed by Earl Spencer vicar of Wormleighton in Warwickshire and in the same year was appointed keeper of manuscripts in the British Museum. In 1800 he received the pension left vacant by the death of the poet Cowper and in 1804 was presented by the Lord Chancellor to the vicarage of Cudham in Kent. A learned Orientalist, he published a voluminous work on *Indian Antiquities* (7 vols., 1793-1800). In addition he wrote *History of Hindustan* (2 vols., 1795-98) and a *Modern History of Hindustan* (1802-10). His *Memoirs*, published at London (1820-22), give a good account of the progress of Indian literature in Britain during the preceding 30 years.

MAURICE OF SAXONY. A French soldier generally known as Marshal Saxe. See SAXE, MAURICE, COUNT OF.

MAURICIUS, mā-rish'ī-ūs, FLAVIUS TIBERIUS. A Byzantine Emperor. See MAURICE.

MAURITANIA. See MAURETANIA.

MAURITIA, mā-rish'ī-ā (Neo-Lat., so called in honor of Prince Maurice of Nassau). A genus of palms, all natives of the hottest parts of America. Some of them, like *Mauritia vinifera*, the wine or buriti palm (q.v.), have lofty columnar smooth stems; others are slender and armed with strong conical spines. The miriti palm (*Mauritia flexuosa*) grows to the height of 100 feet, or even 150 feet in river deltas; it has very large leaves on long stalks. The stem

and leafstalks are utilized for various purposes. The fibre from the young leaves is extensively used for cordage and in the manufacture of hammocks. Sago is obtained from the stems. A beverage is made from the fruit, as from that of the buriti palm and several other species.

MAURITIUS, mā-rish'ī-ūs (named in honor of Maurice of Nassau), formerly ILE DE FRANCE. A British island in the Indian Ocean, 550 miles east of Madagascar, between long. 57° and 58° E. and lat. 19° and 20° S. (Map: Africa, K 7). Its area is 720 square miles. The coasts are low, except at three points where the mountains reach them. The surface rises in the interior to a plateau, surmounted by three groups of mountains with other outlying elevations. Extinct craters testify to the volcanic origin of the island, which, however, is fringed with coral reefs. The highest peaks are Pitou de la Rivière Noire (2711 feet) and Ponce (2650 feet). The coasts, although well indented, are difficult of access on account of the numerous coral reefs by which they are surrounded. The only good harbor is Port Louis, on the northwest coast, which is sheltered by coral reefs. The rivers are short and unfit for navigation. The climate is considerably tempered by the mountainous character of the island. There is about 10° difference between the temperature in the interior and that of the coast regions. The mean annual temperature at Port Louis, the capital and largest town, is about 79° F. The rainfall varies from 145 inches per year in the south-east to 31 in the west. The island has suffered considerably from hurricanes and fever epidemics. The present flora is almost entirely foreign, although some of the plants were introduced so long ago that they have come to be considered indigenous. The fauna of Mauritius, never very extensive, has been still more impoverished by the total destruction of the once magnificent forests, which have been replaced with plantations. Most of the domestic animals are of foreign origin. Among the extinct species may be mentioned the dodo (q.v.) and several other birds whose inability to fly was the cause of their early extermination. Mauritius has a fertile although somewhat stony soil, adapted for the cultivation of the chief tropical products. Cane sugar has been the staple of the island for a very long period, and it is mainly by the sugar crop that the economic condition of the island is determined. Formerly nearly all the export sugar went to Europe, but this outlet has been largely closed in recent years by the competition of European beet sugar. If the British East Indian markets had not been opened in the last decade of the nineteenth century, the sugar industry would have been ruined. Other products of minor importance are cereals, cotton, pepper, indigo, coconuts, vanilla, drugs, and tea. The commerce of Mauritius is chiefly with the United Kingdom and the British colonies. In 1902 imports were valued at Rs.31,143,520 (rupee=32.444 cents), of which Rs.8,218,420 from the United Kingdom; in 1912, Rs.32,266,707, of which Rs.11,569,227 from the United Kingdom. Exports in 1902 and 1912 respectively were valued at Rs.36,389,130 and Rs.37,184,189, of which Rs.4,365,350 and Rs.4,466,656 to the United Kingdom. The imports are mainly grain (rice, wheat, etc.), cotton goods, wine, coal, hardware, and manure. Ordinarily about nine-tenths of the export value represents sugar; the sugar export in 1912 amounted to

206,677 metric tons, with estimated value of Rs.34,900,000. The value of the aloë-fibre export in 1912 was Rs.681,978. Minor exports are molasses, rum, coconut oil, and vanilla. Port Louis is connected by steamship lines with Marseilles (France) and Colombo (Ceylon), as well as with England via the Cape of Good Hope. There is frequent communication by both sail and steamer with Madagascar, Natal, Réunion, India, Australia, etc.; most vessels plying between Europe and India via the Cape of Good Hope touch at Port Louis. Mauritius has 130 miles of railway comprised in seven lines, all owned and operated by the government.

Under the constitution as amended in 1884-85 the colony is administered by a Governor assisted by an executive council of 4 ex-officio members. There is a legislative council of 27 members, 8 being ex-officio, 9 nominated by the Governor, and 10 elected. The right of suffrage is contingent on certain property qualifications. The law is based on the Code Napoléon and other French laws modified by colonial ordinances.

The estimated population of Mauritius in 1767 was 19,000, and in 1837, 134,000; the census of 1881 returned 359,874; 1891, 370,588; 1901, 380,040; 1911, 377,083. Of the total in 1911, 370,393 were returned for the island of Mauritius and 6690 for the dependencies. Of the 370,393, the number of persons of European, African, or mixed descent was 108,844; Indo-Mauritians, i.e., persons of East Indian descent born in Mauritius, 222,361; other Indians, 35,526 (it is probable that a number of old Indian immigrants returned themselves as Indo-Mauritians); Chinese, 3662. The military, included in the total 377,083, numbered 1602. Indians and persons of Indian descent constituted about 70 per cent of the population. The Indian population dates from the emancipation of the slaves (about 66,000) in 1834-39. As many of the freed slaves were unwilling to work on the estates of their former masters, the latter invited immigration from India, which, except for occasional temporary stoppages, continued until 1910. The Indo-Mauritians are now predominant in commerce and agriculture, and the amount of land held by them as small planters is increasing. The white population is largely French. In 1911 Roman Catholics numbered about 122,000 and Protestants about 7000. In recent years a great part of Port Louis, the capital, has passed from European to Indian or Chinese ownership, and the population of the city has somewhat declined; in 1911 it had, with suburbs, 50,060 inhabitants. (See PORT LOUIS.) The second largest town is Curepipe, with 17,173 inhabitants in 1911; Mahebourg had 3505. Primary education is free, but not compulsory. In 1912 primary education was provided in 60 government schools, with 9522 pupils (average attendance, 5775), and 89 aided schools, with 11,987 pupils (7635). Relative numbers of the pupils according to religion were: Roman Catholics, 62.06 per cent; Anglicans, 2.32; other Christians, 0.98; Mohammedans, 10.59; Hindus and others, 24.05. The Royal College provides secondary instruction.

The dependencies of Mauritius include various small islands in the Indian Ocean. Of these, the most important is Rodrigues, in lat. 19° 44' S. and long. 63° 34' E., 344 nautical miles from Mauritius. It has an area of 42 square miles and a population (1911) of 4829. Diego Garcia

(pop., 517) is the most important of the Oil Islands group. Other dependencies are the Cargados Islands, Chagos Islands, and Eagle Islands.

Mauritius was discovered by the Portuguese in 1505 and remained in their possession until 1598, when it was ceded to the Dutch, who gave it its present name. Aside from erecting a fort at Grand Port, one of the smaller trading ports, the Dutch did no more for the settlement of the island than their predecessors and finally abandoned it in 1710. The island was soon taken over by the French and under their rule began to develop, especially during the second half of the eighteenth century. During the war between France and England at the beginning of the nineteenth century the island was captured by England and was formally ceded by France in 1814.

MAURITIUS AND LAZARUS, ORDER OF. An Italian order of merit with five classes, originally an ecclesiastical order founded by Amadeus VIII of Savoy in 1434. It was suppressed in 1802, restored by Victor Emmanuel of Sardinia in 1816, and reconstituted by Victor Emmanuel II in 1868.

MAUROCORDATOS. See MAVROCORDATOS.

MAUROMICHALIS, māv'ra-mê-kā'lēs. See MAVROMICHALIS.

MAURRAS, mō'rā', CHARLES MARIE PHOTIUS (1868-). A French critic and journalist, born at Martigues and educated at the Collège Catholique of Aix. He founded with Moréas (q.v.) the *Ecole Romane Française*. A leader in the fight against romanticism, in the reaction towards a neoclassical tradition, he contributed to numerous reviews and from 1894 to 1900 was literary critic for the Larousse Encyclopædia. He wrote: *Jean Moréas* (1891); *Le chemin de paradis* (1895); *L'idée de la décentralisation* (1898); *Trois idées politiques: Chateaubriand, Michelet, Sainte-Beuve* (1898); *Les amants de Venise: George Sand et Musset* (1902); *Jules Lemaitre et son ami* (1903), with Boncour; *L'avenir de l'intelligence* (1905); *Le dilemme de Marc Sanguier: essai sur la démocratie religieuse* (1906); *Kiel et Tanger* (1910); *La politique religieuse* (1912); *Enquête sur la monarchie* (1913).

MAURUS, RABANUS. A German theologian. See RABANUS MAURUS.

MAURUS, mā'rūs, SAINT (†494-584). He was born in Rome about 494. He was of a noble family and was placed by his father, Equitius, under the tutelage of St. Benedict, who sent him to Gaul. Here he founded the monastery of Glanfeuil, or Saint-Maur-sur-Loire, in 543, over which he presided for 40 years. He died in 584, and his day is January 15. The Congregation of Saint-Maur has done

a great work in reforming the monastic orders and in ecclesiastic literature.

MAURUS, TERENTIANUS. See **TERENTIANUS MAURUS**.

MAURU'SIL. See **MAURETANIA**.

MAURY, ma'rê, DABNEY HERNDON (1822-1900). An American soldier and author, born at Fredericksburg, Va. He graduated at the University of Virginia in 1841, studied law, and afterward went to West Point, where he graduated in 1846. He served in the Mexican War and was brevetted first lieutenant for gallantry at Cerro Gordo. From 1847 to 1850 he was assistant professor of geography and ethics, and from 1850 to 1852 of infantry tactics at West Point. He then served in the West and was superintendent of cavalry instruction at Carlisle Barracks in 1858. While serving as assistant adjutant general in New Mexico in 1861 he was discharged from the army and entered the Confederate service as colonel. After the battle of Pea Ridge he was promoted brigadier general and opposed Grant during the Van Dorn raid. He also met Sherman successfully in the latter's attack on Vicksburg in 1862. Later he was promoted major general and was placed in command of the Department of Tennessee. At the end of the war he was in command of the Department of the Gulf and surrendered on May 24, 1865. In 1868 he organized the Southern Historical Society. From 1886 to 1889 he served as United States Minister to Colombia. His writings include: *Skirmish Drill for Mounted Troops* (1859); *Recollections of a Virginian in the Mexican, Indian, and Civil Wars* (1894); *Young People's History of Virginia and Virginians* (1904).

MAURY, mō'rê, JEAN SIFFREIN (1746-1817). A French prelate, the son of a shoemaker, born at Valréas in the Department of Vaucluse, France. He studied for the priesthood at Avignon and went to Paris at the age of 20 as *abbé précepteur*. He soon made himself known as an eloquent panegyrist, became a favorite preacher at the court, and was appointed to the abbey of Frénade. He was elected also to a seat in the French Academy (1785). In 1789 he was chosen deputy of the clergy to the States-General, where he was prominent in defense of the church and royalty, and with great vigor, skill, and eloquence opposed the revolutionary measures until the flight of Louis XVI. At the dissolution of the Constituent Assembly he left France in 1792, and at the invitation of Pius VI took up his residence in Rome, where he was received with great honor. In 1794 he was made Archbishop of Nicæa *in partibus*, extra nuncio to the Diet at Frankfort, Cardinal, and Bishop of Montefiascone. On the invasion of Italy by the French in 1798 he fled in disguise to Venice and thence to St. Petersburg. Returning in 1799, he was appointed by the Count of Provence, afterward Louis XVIII, his Ambassador to the holy see. Becoming reconciled to Napoleon, he returned to France in 1806. In 1810 he was appointed Archbishop of Paris, and his refusal to abdicate this office at the command of Pius VII cost him six months' imprisonment at Rome after the Restoration. Maury published a treatise entitled *Essai sur l'éloquence de la chaire* (1810).

MAURY, mou'rê, JUAN MARÍA (1772-1845). A Spanish poet, born at Malaga. He studied abroad, both in France and England, and on his return to Spain took part in the War of the

French Occupation. He was a supporter of Joseph Bonaparte, and was afterward exiled and died in Paris. His works include: *La agresión británica* (1806), *L'Espagne poétique* (1826-27), *Esvero y Almedora* (1840), a poem in twelve cantos.

MAURY, mō'rê, LOUIS FERDINAND ALFRED (1817-92). A French scholar and archæologist, born at Meaux, Seine-et-Marne. In 1860 he was made librarian at the Tuileries. He was appointed professor of history and morality at the College of France in 1862 and was general director of the archives from 1868 until 1888, when he retired. He assisted Napoleon III in his *Histoire de Jules César* and himself published: *Essai sur les légendes pieuses du moyen âge* (1843); *Les fées du moyen âge, recherches sur leur origine* (1843); *Histoire des religions de la Grèce antique* (1857-59); *Croyances et légendes de l'antiquité* (1863); *Les forêts de la Gaule et de l'ancienne France* (1867); *Exposé des progrès de l'archéologie* (1867); *La terre et l'homme* (1869).

MAURY, MATTHEW FONTAINE (1806-73). An American naval officer and hydrographer, born in Spotsylvania Co., Va. He studied at Harpeth Academy in Tennessee until 1825, when he was appointed midshipman in the navy. The next year he was an officer on the *Vincennes* during her voyage around the world. Crippled for the rest of his life by fracturing his leg in 1839, he was appointed to the Naval Observatory and Hydrographic Office in Washington. There he made a study of old ships' logs, the result of which was a series of *Wind and Current Charts* that were of incalculable benefit to navigators. There also he prepared his *Physical Geography of the Sea and its Meteorology* (1855). In 1853 he was promoted to the rank of commander. At the outbreak of the Civil War he offered his services to the Confederacy, and was sent (1862) on a mission to Europe, where he remained until the conclusion of peace. He then went to Mexico and was appointed commissioner of emigration by Emperor Maximilian. Upon the overthrow of the Imperial régime Maury returned to the United States and became professor of physics at Virginia Military Institute. Among his publications not previously mentioned are *Letters on the Amazon and the Atlantic Slopes of South America* (1853) and *Lanes for Steamers Crossing the Atlantic* (1854). Consult Corbin, *Life of Matthew Fontaine Maury* (London, 1888).

MAUSER, mou'zër. The name of two German inventors. **PETER PAUL** (1838-1914) and his brother **WILHELM** (1834-82) were both born at Oberndorf, Württemberg, and both secured employment in the arsenal of their native town. The two brothers produced in 1863 a needle gun, which they improved in 1865. In 1867 they went to Liège, where they perfected, with the financial help of the American Norris, the breech-loading gun. Returning in 1869 to Oberndorf, they placed their invention before the Prussian government, which acquired the model in 1871, the "Mauser model 1871." To be able materially to profit by their invention they bought in 1874 the arsenal at Oberndorf, which later was changed into a stock company and taken up in 1897 by the Deutsche Waffen und Munitionsfabriken. After 1874 they invented a pistol and (1879) a revolver and repeating rifle. Soon they were in a position to fill government contracts for rifles, supplying Servia, Turkey, Belgium, Spain, Portugal,

Sweden, Mexico, and several South American republics. Peter Paul Mauser is principally known for his invention of the Mauser magazine rifle (1897), which was adopted by the German and other armies, and for a magazine pistol. See SMALL ARMS.

MAUSER GUN. See MAUSER; SMALL ARMS.

MAUSOLEUM (Lat., from Gk. *μαυσῶλειον*, *mausōleion*, from *Μαύσῳλος*, *Mausōlos*). A sepulchral monument of large size, containing a chamber in which urns or coffins are deposited. The name is derived from the tomb erected at Halicarnassus to Mausolus, King of Caria, by his widow, Artemisia. (See ARTEMISIA, 2.) The work is said to have been begun by Mausolus (353 B.C.), and to have been completed by the artists after the death of Artemisia (c.350 B.C.). It was one of the most magnificent monuments of the kind and was esteemed one of the seven wonders of the world. The architects were Satyrus and Pythus or Pythis, and it is said that Scopas, Bryaxis, Timotheus (or, according to Vitruvius, Praxiteles), and Leochares were employed on the sculpture. It was described by Pliny and is mentioned by mediæval writers, as late as the twelfth century, in a manner that seems to imply that it was still uninjured. The upper part was overthrown, probably by an earthquake, in the course of the next two centuries; for, when the Knights of St. John of Jerusalem, in 1402, took possession of the site of Halicarnassus, they used the ruins as a quarry in building their castle. The interior was still undisturbed, for in 1522, when repairing the castle and excavating among the ruins for building materials, the knights discovered a large chamber decorated with colored marbles, reliefs and columns. These were all destroyed to furnish lime. An inner chamber contained a white marble sarcophagus. Fragments of the frieze were used to decorate the castle walls, and in 1846 these were obtained by Sir Stratford Canning for the British Museum. In 1856-58 excavations conducted for the British government by Charles Thomas Newton (q.v.) led to the discovery of the lost site and the recovery of many fragments of architecture and sculpture. (See BUDRUM.) The foundations and fragments, combined with Pliny's rather inadequate notice, have led to at least 50 attempts to reconstruct the monument, but without any very conclusive result. The Mausoleum consisted, apparently, of a lofty rectangular base or podium, about 230 by 250 feet, on which stood a chamber surrounded by an Ionic colonnade (the *pteron*) of 36 columns; this seems to have been surmounted by a pyramid of 24 steps, on the truncated apex of which was a marble four-horse chariot. Whether the colossal statues of Mausolus and Artemisia were placed in the chariot or elsewhere in the building is a matter of dispute. The reliefs belong to three friezes and represent a battle of the Greeks and the Amazons, the contest between the Centaurs and Lapithæ, and a chariot race. Their exact position in the building is uncertain, though the first is probably the frieze of the external Ionic order. In addition to the histories of Greek sculpture, consult: Newton, *History of Discoveries at Halicarnassus, Cnidus, and Branchidæ* (London, 1862-63); id., *Travels and Discoveries in the Levant* (ib., 1865); Oldfield, in *Archæologia*, vols. liv, lv (ib., 1895-96); Adler, *Das Mausoleum zu Halikarnas* (Berlin, 1900); A. H. Smith, *Catalogue of Sculptures in the British Museum*,

vol. ii (London, 1900), where the fragments are described and sketches of the proposed restorations are given; K. Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., Leipzig, 1914).

By extension the term is used to designate any monumental sepulchral edifice, whether ancient or modern. Among the most important tomb structures of this sort the following may be mentioned. (1) The mausoleum of Augustus in the Campus Martius at Rome, a circular stone edifice nearly 300 feet in diameter, still partly extant. Its massive vaults were probably once covered by a mound of earth planted with trees. (2) Of Hadrian, now the Castel Sant' Angelo, on the right bank of the Tiber, also a vast circular structure, once richly adorned with statues and surmounted by a conical roof of stone. (3) Of Theodoric, at Ravenna, a stone structure externally circular, in two stories; only 30 feet in diameter, it is remarkable for its dome, composed of a single stone 36 feet in diameter. (4) Several remarkable domed structures in India built under the Mogul emperors, of which three are especially important—the tomb of Mahmud at Bijapur, with a dome covering a chamber 137 feet in diameter; of Humayun at Delhi, of sandstone and marble; of the Shah Jehan at Agra, known as the Taj Mahal (q.v.), the most beautiful of all mausolea, built about 1650 largely of alabaster inlaid with precious and semiprecious stones. On the other hand, the mausoleum of Akbar at Secundra is an open structure in several diminishing terraces. (5) Of Napoleon I at Paris, the famed Dome of the Invalides (q.v.), built as a royal sepulchral chapel in 1675-1735, but internally remodeled in 1843-52, with an open crypt to receive the remains of the exiled Emperor. (6) Of General Grant in Riverside Park, New York City, built by popular subscription to receive the bodies of the former President and his wife, and internally modeled somewhat after that of Napoleon.

Sepulchral chapels and tomb mosques are sometimes included under this title, as the tomb mosques of Cairo and the (unfinished) sepulchral chapel of King Manoel at Belem in Portugal; but this is hardly a correct use of the term. On the other hand, the Imperial *turbek* of the Turkish sultans at Constantinople properly belong in this category of mausolea; they are impressive structures, especially those of Solymán and of Roxelana (Khourrem) in the precincts of the Suleimaniyeh. See AUGUSTUS, MAUSOLEUM OF; GRANT, ULYSSES SIMPSON; HADRIAN, TOMB OF.

MAUSOLUS. See MAUSOLEUM.

MAUVAISES TERRES, mô-vâz' târ'. See BAD LANDS.

MAUVE, mouv, ANTON (1838-88). A Dutch landscape and animal painter, one of the most eminent of the nineteenth century. He was born at Zaandam, but his family removed to Haarlem when he was a boy, and Mauve studied there under the cattle painter Van Os, but he was chiefly self-taught. Afterward he spent some time in Oosterbeek and later lived at The Hague and at the village of Laren. Mauve stands with Israëls and the brothers Maris in the front rank of modern Dutch painters. His subjects are usually landscapes with cows, sheep, horses, or figures of peasants, and scenes on the seashore. They are simple, truthful, yet refined, and possess that fine poetic quality which modern Dutch

art has inherited from the past. In the subtle appreciation of values and in the luminous quality of his skies he has never been surpassed. He painted in oil and water color with equal ease, although his water colors are more spontaneous. Fine examples of his paintings in oil are: "Heath near Laren" and "Milking Time," both in the Rijks-Museum; "Spring" and "Autumn," two fine sheep paintings, in the Metropolitan Museum of Art, New York; and "Watering Horses" (National Gallery, London). Among his water colors two of the best known are "Interior of a Barn" and "Shepherd and Flock." Before he was generally recognized in other countries Mauve was highly esteemed in the United States, where his paintings brought high prices, and where he is well represented in private collections; e.g., by five good cattle pieces in the collection of James G. Shephard. Consult Max Rooses, *Dutch Painters of the Nineteenth Century*, vol. iii (London, 1898-1901), and Marius, *Dutch Painters of the Nineteenth Century* (ib., 1908).

MAUVEIN. See COAL-TAR COLORS.

MAVERICK, PETER (1780-1831). An American engraver and lithographer, born in New York City. He was the son of Peter Rushton Maverick, etcher and engraver, from whom he learned his art. He was a founder of the National Academy of Design and one of the first engravers of note in America, and conducted a flourishing business in New York. His plates, which are chiefly portraits, are deficient in technique and lifeless in expression. Among the best are: Cervantes; Oliver Ellsworth, after Trumbull; Henry Clay, after King (1822); and Andrew Jackson, after Waldo. Asher B. Durand (q.v.), the engraver, was his pupil, and his partner in 1817.

MAVIS (OF. *mauis*, *malvis*, Fr. *mauis*, probably from Bret. *milfid*, *milvid*, *milthoid*, Corn. *melhuet*, *melhues*, lark). The song thrush (*Turdus musicus*, or *philomelus*) of Europe is commonly known in Scotland as the mavis, and although this name is now rather uncommon in England, where "throstle" and "redwing" are more often heard, it has passed into literature to such an extent as to be well known wherever English is spoken. (See SONG THRUSH.) In Scotland the missel thrush (q.v.) is known as big mavis.

MAVOR, JAMES (1854-). A Canadian economist. He was born at Stranraer, Scotland, and was educated at the University of Glasgow. In 1888 he was appointed professor of political economy and statistics in St. Mungo's College, Glasgow. He was also assistant editor of a technical journal, editor of the *Scottish Art Review*, and took part in university-extension work and in practical schemes for the economic betterment of workmen. He went to Canada in 1892 and was appointed professor of political economy in Toronto University. In addition to his professional duties he was intrusted by the British Board of Trade and the Canadian government, as well as by important charitable and economic organizations, with investigations of labor conditions, immigration, railway rates, copyright, grain production and transportation, and other similar subjects. In making these investigations he traveled extensively in America, Europe, and the Far East. He was special lecturer in economics in Punjab University, India, in 1914-15, and was elected a fellow of the Royal Society of Canada. His publications

include: *Wage Theories and Statistics* (1888); *Economic Theory, and History Tables and Diagrams* (1890); *Economic Study, and Public and Private Charity* (1892); *Report on Labour Colonies in Germany* (1893); *English Railway Rate Question* (1894); *Handbook of Canada* (1897); *Notes on Art* (1898); *Report on Immigration into Canada from Europe* (1900); *Report on Workmen's Compensation Acts* (1900); *Papers on Municipal Affairs* (1904); *Report to British Board of Trade on the North-West of Canada* (1905); *Taxation of Corporations in Canada* (1909); *Railway Transportation in America* (1909); *Taxation in Ontario* (1913); *Economic Survey of Canada* (1913); *Economics* (1914); *An Economic History of Russia* (1914); *A Short Economic History of Canada* (1915).

MAVROCORDATOS, mă'vr̩kôr-dä'tas, ALEXANDER, PRINCE (1791-1865). A Greek statesman, born at Constantinople, of a Fanariote family celebrated for the part it has played in the affairs of Greece. He was a scholar and an ardent patriot and devoted himself with singleness of purpose to the cause of Greek independence, for which he expended the bulk of his private fortune. He prepared the Greek declaration of independence and the plan of a provisional government, was elected president of the first National Assembly (1822), and undertook the same year an expedition to Epirus, which ended in the unsuccessful battle of Peta; but he distinguished himself by his bold and resolute defense of Missolonghi (1822-23). Notwithstanding the opposition of the party of Kolokotronis and Demetrius Ypsilanti (see KOLOKOTRONIS; YPSILANTI) he was able afterward to render important services to his country in the heroic defense of Navarino and Sphagia. He was a steadfast admirer of English policy and institutions and a fierce opponent of the pro-Russian government of Capo d'Istria (q.v.). After the accession of King Otho (1832) he was at different times a cabinet minister and ambassador at various courts. In 1833 he was Prime Minister. The leading feature of his policy—his endeavor to promote British influence—made him at times very unpopular among his countrymen. At the outbreak of the Crimean War he became head of the cabinet, but resigned after remaining in office for little more than a year. He died Aug. 18, 1865. Consult Oscar Brownning, *History of the Modern World*, vol. i (New York, 1912).

MAVROMICHALIS, mă'vr̩-mê-kä'lēs. A Greek princely family of Maina in the Morea. Its more important members were: GEORGIOS, who led the Mainot revolt of 1770; PETROS (1775-1848), often called Petro Bey, who became Bey of Maina in 1816, led the revolt of 1821 in the Morea, became president of the Congress of Astros in 1822, and as leader of the Hellenic party opposed Capo d'Istria and his Russian policy and was imprisoned in Nauplia; and his brother KONSTANTINOS and son GEORGIOS, who had fought bravely in the war of independence and who in 1831 assassinated Capo d'Istria to avenge the imprisonment of Petro Bey. Georgios was court-martialed and executed and Konstantinos was killed by the President's followers. Petros was set at liberty by the new administration, and as a reward for his zealous support of Otho was made vice president of the Council of State. A younger branch of the family is still active in Greek politics.

MAWER, MAR, ALLEN (1879-). An

English scholar, born at South Hackney. He was educated at University College, London, where he won the Morley gold medal, at the University of London, and at Cambridge, where he was a fellow from 1905 to 1911. In 1905-08 he was lecturer in English in the University of Sheffield and in 1908 became professor of English language and literature at Armstrong College, Newcastle. Examiner for the mediæval and modern languages tripos at the universities of Leeds, Liverpool, and Wales, a member of the joint matriculation board of the northern universities, vice president of the Viking Society and editor of its *Saga-Book* and *Year-Book*, he wrote "The Vikings" in *Cambridge Manuals of Science and Literature* (1913) and edited English classics.

MAWMOISINE, WILLIAM. See MALVOISIN, WILLIAM.

MAW SEED (*maw*, AS. *maga*, Icel. *magi*, OHG. *mago*, Ger. *Magen*, stomach + *seed*). A common name for poppy seed, which is given to cage birds, especially when they are molting.

MAWSON, ma'son, SIR DOUGLAS (1882-). An Antarctic explorer and geologist who was born in Bradford, England, but early went to Australia, where he graduated (bachelor of mining engineering) from the University of Sydney in 1901 and (D.Sc.) in 1909 from the University of Adelaide. At the latter institution he lectured on geology in 1905, having already explored geologically the New Hebrides (1903). In Shackleton's (q.v.) expedition, where he was one of the scientific staff, with David and Murray, he reached and determined the position of the south magnetic pole on Victoria Land. Mawson organized and commanded the Australasian expedition (1911-14) to explore Antarctic lands south of Australia, where three stations were to be occupied for scientific observations. An intermediate station, equipped with wireless, was located on Macquarie Island (q.v.), while the principal stations were on the continent of Antarctica. Mawson occupied Commonwealth Bay, 67° S., 143° E., whence he discovered and explored King George V Land, from 138° to 153° E., and southward to 70° 30' S., by journeys of 2400 miles, in which Ninnis and Mertz perished and Mawson himself had the narrowest of escapes. Dr. Wild took station on Shackleton Oceanic Ice Cap (which extends from the continent 180 miles northward over the sea), in 66.8° S., 95° E., and discovered and explored Queen Mary Land, between 87° and 101° E., by sledge trips of 800 miles without disaster. Geographically the continent of Antarctica, a high glacier-covered region, is now known to extend continuously between 86° E. and 150° W. The lands of Sabrina and Côte Clarie proved to be nonexistent. While the expedition was unable to reach Totten, Budd, and Knox Lands, Mawson reported that Wilkes's report of an Antarctic continent (1840) was fully confirmed, although at points oceanic ice caps and glaciers were mistaken by him for ice-clad lands. Mawson fixed a fundamental meridian for Adélie Land, while at sea Davis located the continental slope through 55° of longitude, and discovered Mill Rise, a submarine ridge south of Tasmania. Mawson's discoveries are more important and extended than any other Antarctic explorations made in the early part of the twentieth century, and this despite the essentially scientific purpose of the expedition. Particularly valuable data were gathered regarding the forms of animal life

in the region. In 1915 the officers and men of the expedition were awarded the Polar medal by King George. For his services Mawson was knighted in 1914. In 1915 he visited the United States to tell, with the aid of remarkable pictures, the story of his Antarctic experiences. Besides geological works Mawson published an account of the expedition of 1911-14 under the title *The Home of the Blizzard* (2 vols., Philadelphia, 1915).

MAWSON, THOMAS H (AYTON) (?-). An English landscape architect and expert in town planning. He studied architecture, arboriculture, and horticulture and founded the house of T. H. Mawson and Sons, with offices in Vancouver as well as London and Lancaster. He was lecturer on landscape design at Liverpool University. The Mawsons laid out many elaborate gardens, notably those for Queen Alexandra of Denmark at Copenhagen, but their best-known work is city planning. Among the towns for which they made plans are: Calgary and Banff, Alberta; Vancouver, British Columbia; and in Great Britain, Exeter, Dunfermline, Sheffield, Southport, Burslem, and Bolton. Mawson wrote, besides descriptions of many of these particular plans, *The Art and Craft of Garden Making* (1900; 4th ed., 1912), *Civic Art* (1911)—both elaborate books.

MAX, mäsks, GABRIEL (1840-). A German historical painter, of the Munich school. He was born July 23, 1840, in Prague, the son of the sculptor Joseph Max (1803-54). After his father's death he studied four years at the Academy of Prague, three years in that of Vienna, and from 1863 to 1869 under Piloty at Munich. His first notable success was achieved by "The Christian Martyr" (1867), a maiden bound to a rude stone cross, at whose feet a young Roman patrician, returning at dawn from revelry, lays down a garland. His next noteworthy productions were "The Nun in the Cloister Garden" (1869, Hamburg Gallery) and "The Anatomist (1869)—both strikingly sombre and pathetic and illustrative of the painter's morbid tendencies. His strongly individual art is often marred by an unwholesome combination of the sensational and the tragic. He prefers a delicate and subdued scheme of color, and in some of his landscapes, as "The Spring Gale" and "Adagio," he shows great poetic sensitiveness. Patient suffering is depicted in "The Blind Lamp Seller in the Catacombs" (1871) and in "Nydia," the blind Thessalian flower girl of Bulwer's *Last Days of Pompeii* (1874). One of his most touching pictures is "The Last Token" (1874, Metropolitan Museum, New York). The tragic element is best represented by "The Lion's Bride" (1875, Manchester Museum), probably his best-known work. The "Handkerchief of St. Veronica" (1874) created a sensation as a pictorial phenomenon, the Saviour's eyes appearing by turns to open and close. The spiritualistic tendencies which he later developed are revealed in such paintings as "Spirit Greeting" (1879) and "The Clairvoyant of Prevorst" (Prague Museum). His illustrations for Goethe's *Faust* and Wieland's *Oberon* are well known, and his beautiful mystical girls' heads and madonnas also deserve mention. Consult: Klemt, *Gabriel Max und seine Werke* (Vienna, 1887); Nicolaus Mann, *Gabriel Max' Kunst und seine Werke* (Leipzig, 1888); Meissner in *Die Kunst unserer Zeit* (Munich, 1899).

MAX, WILHELM AUGUST ALBERT GOLGOV ODO, PRINCE OF SAXONY (1870–). A German Catholic theologian and authority on liturgy. The son of King George of Saxony and the youngest brother of King Frederick Augustus III, he was born in Dresden and was ordained to the priesthood in 1896. He was professor of canon law and liturgiology in the University of Fribourg, Switzerland, until 1911, and in 1912 became an instructor at the archiepiscopal seminary for priests in Cologne. In 1914–15 he was at the front as a regimental chaplain with the Saxon army and was popular with the Saxon soldiers as "Chaplain Max." Many of his sermons were published, including several in French preached in Paris at various times. Prince Max was one of the editors of the *Patrologia Orientalis* (1908 et seq.). His works, mostly on liturgy and on the Eastern church, include: *Vorlesungen über die orientalische Kirchenfrage* (1907); *Ritus Missæ Ecclesiarum Orientalium*, in five parts: *Syro-Maronica, Chaldaica, Græca, Armenica, Syriaca-Antiochena* (1907–08); *Prælectiones de Liturgiis Orientalibus* (1908–13); a revised edition (German) of Chrysostom's homily on Matthew's Gospel (1910–11); an edition of Chrysostom on the eucharist (1910); *Ephesos und seine Ruinen* (1910); *Der Berg Athos in Macedonien* (1910); an edition of Chrysostom on *Genesis* (1914).

MAXENTIUS, mäs-ën'shi-us. Roman Emperor. See CONSTANTINE I.

MAXENTIUS, CIRCUS OF. A circus (q.v.) on the Appian Way, about 2 miles from Rome, dedicated to Divus Romulus, the young son of Maxentius, who died in 309 A.D. It was 530 yards long by 86 yards in width and could accommodate, perhaps, 18,000 spectators. Its ruins throw much light on the Circus Maximus and other early circuses. Consult, for a diagram of it, W. Smith, *A Dictionary of Greek and Roman Antiquities*, vol. i, p. 432 (3d ed., London, 1890), and Baumeister, *Denkmäler des klassischen Altertums*, vol. i, p. 694 (Munich, 1889).

MAXEY, SAMUEL BELL (1825–95). An American soldier, born at Tompkinsville, Ky. He graduated at the United States Military Academy in 1846 and served throughout the Mexican War. In 1850 he began to practice law at Albany, Ky., but at the outbreak of the Civil War raised a Confederate regiment, becoming its colonel; soon he was promoted brigadier general. He served under General Bragg, took part in the attack on Buell's retreating army, and was at the first siege of Port Hudson. In 1863, having been assigned to the command of Indian Territory, he organized an army of 8000, defeated Gen. Frederick Steele, and captured his train of 227 wagons. For these services he was promoted major general. In 1874 he was elected United States Senator and in 1881 was reelected, serving as chairman of the Committee on Post Offices.

MAXIM. See APHORISM; GNOME; MAXIMS.

MAXIM, SIR HIRAM STEVENS (1840–1916). An engineer and inventor, born at Sangersville, Me., where he received his early education. After being apprenticed to a coach builder, he worked in a machine shop at Fitchburg, Mass., later becoming foreman of an instrument factory. After this he worked at the Novelty Iron Works and Shipbuilding Company in New York. Meanwhile he had patented various improvements in steam engines and had put on the

market an automatic gas machine. In 1878 he invented an improved incandescent lamp. In this field he made other important inventions, some of which were exhibited at the Paris Exposition of 1881. In the meantime in 1880 he had gone to Europe and there proceeded to develop his most celebrated invention, the Maxim gun. (See MACHINE GUN.) This weapon is automatically loaded and fired by the energy of the recoil. More than 100 international patents relating to petroleum and other motors, etc., were taken out by him. His inventions also included explosives and ordnance materials. For many years he was a member of the British ordnance firm of Vickers Sons and Maxim. He bought an estate near Bexley, England, where he erected his laboratories and experimental station and there carried on elaborate experiments in aeronautics (q.v.), constructing in 1894 a large-power flying machine. He became a naturalized citizen of Great Britain, alleging unfair treatment of his inventions by the United States government. He was made Chevalier of the Legion of Honor and was knighted in 1901. He published *Artificial and Natural Flight* (1908). Consult his autobiography, *My Life* (New York, 1915).

MAXIM, HUDSON (1853–). An American inventor and engineer, born at Orneville, Me. He was educated in the local schools and at the Wesleyan Seminary, Kent's Hill, Me., and devoted himself to the study of chemistry, engineering, and natural science, at the age of 22 formulating an hypothesis of the compound nature of atoms. From 1883 to 1888 he was engaged in the printing and publishing business at Pittsfield, Mass., devising a process for printing daily papers in colors. In 1888 he became interested in ordnance and explosives and was among the first to make smokeless powder in the United States. Extending this business, he developed the multiperforated smokeless cannon powder, which is in use by the United States government; in 1901 he sold to the same government the secret of the high explosive, maxinite (q.v.). Later inventions include various processes connected with the electric furnace; a detonating fuse for high-explosive projectiles; automobile torpedoes; stabilite, a smokeless powder invented by him and developed by him in connection with the E. I. du Pont de Nemours Powder Company; motorite, a self-combustive material for driving torpedoes; and a torpedo ram. He is author of *The Science of Poetry and Philosophy of Language* (1910); *The Game of War* (1912); *Chronology of Aviation* (1912); *Defenseless America* (1915).

MAXIMA AND MINIMA (Lat., neut. pl. of *maximus*, greatest, and *minus*, least). In mathematics, the greatest and the least values of variable quantities or magnitudes. Strictly speaking, a maximum is not necessarily the greatest of all the possible values of a variable; it is a value which is greater than the values immediately preceding and following it in the series. Similarly, a minimum, strictly defined, is a value which is less than the values immediately preceding and following it. Hence a function may have several maxima and minima, equal or unequal among themselves. Thus, in the accompanying figure, a_1, a_2, a_3 are maximum values of the ordinates of $f(x)$, and b_1, b_2, b_3, b_4 are minimum values. The tangent of the angle which a line tangent at any point to the curve makes with the X axis is zero at a maximum

or minimum value of the ordinate. This means that the differential coefficient $\frac{dy}{dx} = 0$ (see CALCULUS), and hence the abscissas corresponding

to the maxima and minima are the roots of $\frac{dy}{dx} = 0$.

A function of two independent variables, $f(x, y)$, has a maximum value when $f(x, y) > f(x + h, y + k)$ for all small values of h and k , positive or negative; and a minimum value when $f(x, y) < f(x + h, y + k)$. The conditions for maxima and minima in the case of a

function u of two variables are $\frac{\partial u}{\partial x} = 0$ and $\frac{\partial u}{\partial y} = 0$. If $A = \frac{\partial^2 u}{\partial x^2}$, $B = \frac{\partial^2 u}{\partial x \partial y}$, and $C = \frac{\partial^2 u}{\partial y^2}$, the further conditions for a maximum are $B^2 < AC$ and $A < 0$, and for a minimum $B^2 < AC$ and $A > 0$. When $B^2 = AC$ or $A = B = C = 0$, further investigation is necessary.

A few of the important propositions of plane maxima and minima are: (1) of all triangles formed with the same two given sides, that triangle is the maximum whose sides contain a right angle; (2) of all isoperimetric triangles (those of equal perimeters) on the same base, the isosceles is the maximum; (3) of all isoperimetric triangles, that which is equilateral is the maximum; (4) of all triangles having the same base and area, the isosceles has the minimum perimeter; (5) if a line of given length be bent and its ends joined by a straight line, the area of the figure inclosed is a maximum when the curved line has the form of a semicircle; (6) of all isoperimetric plane figures, the maximum is a circle; (7) of all isoperimetric polygons of a given number of sides, the maximum is regular.

Traces of the doctrine of maxima and minima are to be found in the works of Apollonius on conic sections and among the theorems of Zenodorus. The Hindus displayed great ingenuity in solving, by ordinary algebra, problems of maxima and minima; but thorough investigation of the subject requires the aid of the calculus, and Kepler, Newton, the Bernoullis, together with Maclaurin, Euler, Lagrange, and several other eighteenth-century mathematicians, distinguished themselves in this department. See CALCULUS.

MAX'IM GUN. See MACHINE GUN.

MAXIMIAN, or **MAXIMIAN I.** See DIOCLETIAN.

MAX'IMIA'NUS. A Latin elegiac poet of the sixth century A.D. The author, whose name may be merely borrowed from a character in the fourth of the six elegies, deals in a dramatic and realistic way with variations on the theme "love and old age"; he laments the loss of his youth. His diction and metre are far above the average of the period. The elegies, which show a knowledge of the best works of the Augustan age, were popular during the Middle Ages and

were frequently imitated. They were translated in part in several early English manuscripts and in their entirety, under the title *The Impotent Lover*, by H. W[alker?] (1689), who, like several early editors, ascribed them to Cornelius Gallus. They were edited by Petschenig (1890) and by Richard Webster with commentary (Princeton, 1900). Webster's edition, together with Giardelli's *Studio sulle elegie di Massimiano* (Savona, 1899) and F. Heege's *Der Elegiker Maximianus* (Blaubeuren, 1893), was reviewed by R. Ellis in the *Classical Review*, vol. xv, pp. 368-371 (1901).

MAXIMIANUS I. A Roman emperor. See DIOCLETIAN.

MAXIMIANUS II. A name sometimes applied to Valerius Maximianus Galerius (q.v.), a Roman emperor.

MAX'IMIL'IAN I (1459-1519). Holy Roman Emperor from 1493 to 1519. He was the son and successor of Frederick III and was born at Wiener-Neustadt, near Vienna, March 22, 1459. His first wife, whom he married in 1477, was Mary of Burgundy, daughter and sole heiress of Charles the Bold (q.v.), Duke of Burgundy and sovereign of the Netherlands. Maximilian became at once involved in war with Louis XI of France, who laid claim to Burgundy and other parts of Mary's inheritance. Maximilian won the battle of Guinegate in 1479, but was finally compelled in 1482 to conclude the Treaty of Arras with Louis, who retained Burgundy, Artois, and Franche-Comté. The bulk of the Netherlands, the most opulent realm in Europe, remained with the Hapsburgs. In 1486 Maximilian was elected King of the Romans at Frankfort. In 1488 the Flemings rose against Maximilian, who was held a prisoner at Bruges for three months. In 1490 he made a successful incursion into Hungary and soon after became master of the Austrian crownlands. In the same year he got possession of Tirol. He again took up arms against France, whose King, Charles VIII, had married Anne of Brittany, in order to acquire that great duchy; after a matrimonial alliance had been concluded between that Princess and Maximilian. By the Treaty of Senlis, in 1493, Maximilian recovered Artois and Franche-Comté. In the same year he succeeded his father on the Imperial throne of Germany. Soon afterward, Mary of Burgundy having died in 1482, he married Bianca, a daughter of the late Duke of Milan, Galeazzo Sforza, and thus was involved subsequently in the Italian wars. He joined the League of Cambrai against Venice in 1508 and the Holy League against France in 1513, and after Francis I's victory at Melegnano (1515) (q.v.) was forced to cede Milan to the French. Nor was Maximilian more successful against the Swiss, who in 1499 completely separated themselves from the German Empire. By the marriage of Philip, the son of Maximilian, with the Infanta Joan, daughter of Ferdinand and Isabella, the house of Hapsburg, in 1516, ascended the throne of Spain in the person of Charles I (Maximilian's successor in the Empire as Charles V). The marriage of two of Maximilian's grandchildren with the son and daughter of Ladislas, King of Hungary and Bohemia, ultimately brought both these kingdoms to the Austrian monarchy. Maximilian died at Wels, in Upper Austria, Jan. 12, 1519. As an administrator Maximilian sought to strengthen the organization of the Empire. Reforms in the administra-

tion were introduced by the establishment of the Imperial Chamber and the Aulic Council (q.v.). Maximilian wrote works on the art of war, hunting, gardening, etc., and sketched the *Weisskunig*, an autobiographic poem. His frank and generous nature and his many accomplishments gained him the title of Last of the Knights.

Watson, *Maximilian I.* (London, 1902); *Cambridge Modern History*, vol. i (New York, 1903); Paul van Dyke, *Renaissance Portraits* (ib., 1905); Jansen, *Kaiser Maximilian I.* (Munich, 1905).

MAXIMILIAN II (1527-76). Holy Roman Emperor from 1564 to 1576. He was the eldest son of the Emperor Ferdinand I and was born in Vienna, July 31, 1527. He was educated in Spain with his cousin, Philip II. In 1548 he married his cousin Maria, daughter of Charles V. Notwithstanding the surroundings in which he had been educated, his attitude towards the Reformation was so liberal that he was even considered by those about him to be at heart a heretic. The Protestants of Germany hoped that they might have a Protestant emperor of the house of Hapsburg. These hopes remained unfulfilled. Lack of decision, dynastic policy, his personal ambitions, all united to keep Maximilian in his allegiance to the Church. He was crowned King of Bohemia and elected King of the Romans in 1562 and was elected King of Hungary in 1563. In 1564 he succeeded his father on the Imperial throne of Germany, in Bohemia, and in the portion of Hungary not under the sway of the Turks or the Transylvanian princes. In 1566 Solyman the Magnificent (q.v.) determined to make a fresh onslaught upon the power of Austria. His vast army was arrested by the heroic defenders of Sziget, and the great Sultan died in his camp before the stronghold fell. Maximilian displayed great inactivity in the face of the impending danger and concluded a disadvantageous treaty with Solyman's successor. The marriage of Maximilian's daughter Anne with Philip II, and the hope held out to him by the Pope that he might acquire the Polish Kingdom, dampened the Emperor's interest in the Protestant cause. He interceded with Philip in behalf of the Protestants of the Low Countries, but without much success. Under his tolerant rule Germany enjoyed a period of comparative tranquillity. Consult: Koeh, *Quellen zur Geschichte Maximilians II.* (2 vols., Leipzig, 1857-61); Hopfen, *Kaiser Maximilian II. und der Compromisskatholizismus* (Munich, 1895); Scherg, *Ueber die religiöse Entwicklung Kaiser Maximilians II. bis zu seiner Wahl zum römische König* (Würzburg, 1903). See AUSTRIA-HUNGARY.

MAXIMILIAN, FERDINAND JOSEPH (1832-67). Archduke of Austria and Emperor of Mexico, born at Schönbrunn. He was the second son of the Austrian Archduke Francis Charles and a brother to the Emperor Francis Joseph of Austria. He was liberally educated, became commander of the Austrian navy in 1854, was mainly instrumental in creating the naval port of Trieste, and later served with success as Governor of Lombardy and Venetia. He traveled extensively in Europe and made a voyage to the countries of South America. In 1862-63 the French troops of Napoleon III intervened in

the internal affairs of Mexico and on June 11, 1863, occupied the city of Mexico. (See MEXICO, *History*; JUÁREZ.) On July 19 the French commander convened an Assembly of Notables, which proclaimed an empire and offered the crown to Maximilian. He announced that he would accept the throne upon the condition that his choice should be ratified by "a vote of the entire country" and that guarantees for the protection of the Empire from the dangers which threaten its integrity and independence should be given. Marshal Bazaine secured the popular vote in the territory held by the French troops, and Napoleon signed the Treaty of Miramar, by which he bound himself to maintain the French army in Mexico until the army of the Empire should be thoroughly organized. Thereupon Maximilian renounced his rights to the Austrian throne and, contrary to the advice of the Emperor Francis Joseph, accepted the Mexican crown. On May 29, 1864, Maximilian, with the Empress Carlotta, daughter of King Leopold of Belgium, landed at Vera Cruz. The new ruler announced that his mission was "the regeneration of Mexico." Ignorant of the characteristics of the country and its people, he endeavored to conciliate all parties, but soon found himself without the cordial support of any. He alienated the clerical party by failing to repeal the reform laws. Desiring to rule without the French, he neglected their representatives, until he suddenly realized that the foreign army, hated equally by all divisions of his subjects, was the only power really behind his throne. Influenced by unwise councils, the Emperor issued the Decree of Oct. 3, 1865, declaring that all persons bearing arms against his Empire were bandits, and if caught would be tried by court-martial and shot. Before the end of the month four highly esteemed Republican officers had been executed in accordance with this decree, and the last hope of popular support for Maximilian's rule had been destroyed. Meantime the United States government, relieved of its embarrassments by the fall of the Confederacy, succeeded in convincing the French Emperor that his intervention in Mexico would not be tolerated. In consequence on May 31, 1866, Maximilian received dispatches announcing that all French troops would be withdrawn from Mexico. Maximilian would probably have resigned at once had not the Empress Carlotta dissuaded him, undertaking to go to Europe and use her influence with Napoleon III. She proceeded to Paris, where the Emperor at first refused to see her and finally brutally asked her to leave France. The Pope gave her little better consolation, and she became hopelessly insane. (See CARLOTTA.) Maximilian again considered abdication, but referred the decision to his Council, which voted against it. The Church party, also, came forward with an offer to support the Emperor, and he decided to make another effort to regenerate the country. Generals Miramón, Marquez, and Mejía were placed in charge of the Imperial forces, and Maximilian moved his seat of government to Querétaro. There he was surrounded by the Republican army in the early part of March, 1867. On May 14, plans were made for a sortie by which the Emperor might escape to Mexico City or to the coast. Before such plans could be carried out, Col. Miguel López, a constant favorite of the Emperor and Empress and one who had received many proofs of their gener-

osity, informed the enemy of the plan and arranged to admit them into the Imperial camp. Maximilian and his generals were forced to surrender, and after a short confinement were tried by a military court. The Emperor was accused of treason, usurpation of public power, filibustering, trying to prolong the civil war, and of signing the Decree of Oct. 3, 1865. He was declared guilty and condemned to be shot, together with Generals Miramón and Mejía. The execution took place on the morning of June 19, 1867. The Emperor's body was eventually surrendered to the Austrian government and now rests in the Imperial vault in Vienna. On account of the execution the relations of Austria and Mexico were broken and have been resumed only within recent years. Maximilian was a prolific writer; his writings were published in 1867, just after his death, at Leipzig in seven volumes, under the title *Aus meinen Leben, Reiseskizzen, Aphorismen, Gedichte*. Of this work an indifferent English translation was made the following year, entitled *Recollections of my Life*.

Kemper, *Maximilian in Mexico* (Chicago, 1911); P. F. Martin, *Maximilian in Mexico* (London, 1914).

MAXIMILIAN I (1573-1651). A Duke of Bavaria, prominent in the Thirty Years' War, born in Munich. He was educated at the Jesuit University of Ingolstadt. He succeeded his father in 1597 and in the internal administration of his realm displayed much statecraft, improving the judicial and executive departments, organizing a militia effective for defense, maintaining a well-disciplined standing army under the famous Count of Tilly (q.v.), and placing the treasury upon a secure basis. In the affairs of the Empire he was an active opponent of the Protestant cause. When in 1607 the ban of the Empire was pronounced against the free city of Donauwörth (q.v.), he was appointed to occupy the town, which he forthwith proceeded to make Roman Catholic. As a result of his methods, the Protestant Union was organized in 1608. He in turn established the Catholic League (1609), with himself at its head. After the disturbances in the Austrian Estates (1618-19) he sided with the Emperor Ferdinand II (q.v.), and arrangements were made (1619) by which he was to receive the Upper Palatinate and the electoral dignity of Frederick V (q.v.). His army, commanded by Tilly, defeated that of Frederick under Christian of Anhalt at the battle of the White Mountain (Nov. 8, 1620) and occupied the Palatinate, which was completely devastated, contrary to Maximilian's treaty obligations. It was he who, in opposition to any extension of the Imperial power through Wallenstein's army, effected Wallenstein's dismissal at the Diet of Regensburg (1630). During the Swedish period of the war he was driven from Munich by the entrance of Gustavus Adolphus into Bavaria in 1632. In 1637-38 he fought against the Swedes and French on the upper Rhine, but in 1647 independently concluded the Truce of Ulm. He has been considered the most important German

statesman of the time. Consult Wolf, *Geschichte Maximilians I. und seiner Zeit* (continued by Breyer, 4 vols., Munich, 1807-11), and Högl, *Die Bekehrung der Oberpfalz durch Kurfürst Maximilian I.* (Regensburg, 1903). See THIRTY YEARS' WAR.

MAXIMILIAN II, EMANUEL (1662-1726). An elector of Bavaria, grandson of Maximilian I. He succeeded his father, Ferdinand Maria, in 1679; fought for Austria against the Turks in Hungary (1683); and in 1685 married Maria Antonia, daughter of the Emperor Leopold I. Appointed Governor of the Spanish Netherlands in 1692, he resigned this thankless post after the death of his son, who had been named heir to the Spanish throne. He sided with France in the War of the Spanish Succession, Louis XIV having promised him the Spanish Netherlands. But the defeat of Höchstädt (1704) more than outweighed his previous victories, as he lost all his territory; the Elector was forced to take refuge in the Netherlands and was not restored until the Peace of Baden in 1714. In 1717 he again fought with Austria against the Turks. Consult Ruith, *Kurfürst Max Emanuel von Bayern und die Donaustädte* (Ingolstadt, 1889).

MAXIMILIAN I (MAXIMILIAN JOSEPH) (1756-1825). First King (originally Elector) of Bavaria. A younger son of the Count Palatine Frederick of Zweibrücken-Birkenfeld, he entered the French army in 1777, but resigned as major general at the beginning of the Revolution, when he served in the Austrian army. In 1795 he succeeded his brother Charles II as Count Palatine in Zweibrücken, and in 1799 succeeded Charles Theodore as Elector of Bavaria. His domestic policy was excellent, looking towards general reform. He aimed at dynastic aggrandizement and, as a reward for his support of Napoleon, received the title of King, which he assumed in 1806, and important accession of territory in Swabia and Franconia, together with Tirol and later Salzburg, both of which he had afterward to relinquish. He was the most important unit in the newly formed Confederation of the Rhine. In the War of Liberation he reluctantly sided with the allies. His liberal policy at home was shown by his grant of the constitution of 1818, which unified his scattered domains.

MAXIMILIAN II (MAXIMILIAN JOSEPH) (1811-64). King of Bavaria. He was the son of Louis I; studied at Göttingen and Berlin; traveled in Germany, Italy, and Greece; and gave himself, while prince, to a quiet life surrounded by men famous in art and literature. On his father's abdication in 1848 Maximilian ascended the throne and made concessions to the liberal spirit of the time, but though he favored German unity, he looked with hostility upon Prussia and turned rather to Austria as the leader in the movement of unification. Trost and Leist published his correspondence with Schelling (Stuttgart, 1890).

MAXIMILIAN, ORDER OF. A royal Bavarian order, with but one class, founded by Maximilian II in 1853 for distinction in science and art. It is intended especially for German scholars and artists, and its membership is limited to 100. The King is the grand master.

MAXIMILIANA. See INAJA PALM.

MAXIMINUS, GAIVS JULIVS VERUS. A Roman emperor (235-238 A.D.). He was originally a Thracian shepherd. Attracting the at-

tention of the Emperor Septimius Severus by his immense size and wonderful feats of strength and agility, he was admitted to the army, was rapidly advanced for his bravery, was put in command of a new legion raised in Pannonia, and obtained great influence over the soldiers. At the head of this legion he followed Alexander Severus in his campaign against the Germans. When the army was encamped on the banks of the Rhine, he conspired against Alexander and caused him to be put to death in his tent, with his mother Mammæa (235 A.D.). Being proclaimed Emperor, he named his son Maximus Cæsar and made him colleague in the Empire. He continued the war against the Germans and devastated a large territory beyond the Rhine. But his cruelty and rapacity aroused the indignation of the people. For alleged conspiracy against him he put to death Magnus, a senator, with 4000 other persons, and for the Imperial treasury confiscated the municipal property. He opposed Christianity and persecuted the bishops who had been favored by Alexander. The provinces of Africa revolted and proclaimed Gordianus Emperor; the latter was soon after acknowledged by the Senate and people (March, 238), but died after a brief reign. (See GORDIANUS I.) Fearing the vengeance of Maximinus, the Senate then proclaimed as emperors Pupienus Maximus and Balbinus, and with them was associated, by order of the people, the third Gordianus. Maximinus, having crossed the Isonzo, laid siege to Aquileia in Italy, but met with strong resistance from the garrison and people. The soldiers mutinied and killed both him and his son June 17, 238.

MAXIMINUS DAZA, or **DA'IA**, **GALERIUS VALERIUS**. A Roman emperor (308-313 A.D.), by birth an Illyrian shepherd. When Diocletian and Maximian abdicated (305 A.D.), Galerius, uncle of Maximinus, and Constantius Chlorus were made Augusti, and Flavius Severus and Maximinus Daza became Cæsars, and Daza received the Government of Syria and Egypt. Early in 308 he proclaimed himself Augustus. In 311, after the death of Galerius, he became supreme in Asia. He is said to have persecuted the Christians relentlessly. In 313 war broke out between Daza and Licinius, the successor of Flavius Severus, and ended with the defeat and death of Daza in August of the same year. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

MAX'IMATE (named for its inventor, Hudson Maxim, q.v.). A high explosive, used to some extent as a bursting charge for armor-piercing projectiles. Its composition is a secret, which was acquired by the United States government in 1901, but it is known to be a picric acid compound and is said to be 50 per cent more powerful than ordinary dynamite. Though easily detonated by a suitable fuse, it is practically impossible to explode maximate by shock, and it can withstand not only discharge from a gun, but also the shock of impact of the projectile on the target, not being exploded until the fuse operates. Unconfined maximate burns slowly without explosion, and its property of melting and of solidifying on cooling enables projectiles to be filled with it with great facility. See **EXPLOSIVES**; **PROJECTILES**.

MAX'IMS (Fr. *maxime*,* from ML. *maxima*, maxim, abbreviation of *maxima propositio*, chief premise, fem. sing. of Lat. *maximus*, greatest, superlative of *magnus*, great), **LEGAL**. A term

used by members of the legal profession and writers on jurisprudence to denote those brief and pithy utterances which by general consent have been accepted as stating in condensed, though necessarily imperfect, form the general principles which are the foundation of both law and equity. As the ultimate foundation of these general principles is the natural law of justice, safety, and public policy, the basis of the common or customary law is the same in all countries, and its general principles remain substantially unchanged by statute or local enactment. Hence many of the utterances of ancient Roman magistrates and authors of legal treatises retain as much force and truth as when first promulgated.

In very few instances can the maxims be traced to their original sources. Many are derived from the Roman law; many are from continental jurists of the Middle Ages; while a very large number were enunciated by early English judges and writers, and still others are of quite modern origin. Like other expressions of the common law, maxims derive their force and authority, in the first place, from the truth and justice of the principles which they enunciate, and, secondly, from the universality of their acceptance and application by courts in the past. They are not, therefore, of absolutely equal and binding authority, and it is impossible to draw a line strictly dividing accepted maxims from mere expressions of opinion. The number of those universally accepted as having some authority in law is very large indeed. Works devoted entirely to the consideration of the meaning and application of this form of law have been published by several authors.

Examples are: *Ratio est anima legis*—reason is the soul of the law; *Caveat emptor*—let the buyer be on his guard—an important principle of the law of sales, viz. that the buyer gets no better title than the vendor has; *Qui facit per alium, facit per se*—he who acts by another, acts himself—in which may be seen the main principle of the law of agency; *Æquitas sequitur legem*—equity follows the law; *Ex nihilo nihil fit*—from nothing comes nothing; *Fraus est celare fraudem*—to conceal a fraud is itself a fraud; *A l'impossible nul n'est tenu*—no one is bound to do what is impossible—the language being what is called law French; *Ubi jus, ibi remedium*—where there is a legal right there is a legal remedy; *Ignorantia legis neminem excusat*—ignorance of the law excuses no one; *Prior tempore, potior jure*—first in time, first in right; *Id certum est, quod certum reddi potest*—that is certain which may be rendered so. Among those commonly given in English may be mentioned: Acts indicate the intention; When the equities are equal the law shall prevail; Once a mortgage, always a mortgage; The king can do no wrong; Who seeks equity must do equity.

The difficulty in practically employing maxims is twofold: first, in correctly amplifying and expounding the extended meaning sought to be conveyed in the condensed form; and, secondly, in properly applying it to the adjudication of the particular facts of the case in question; and it is the work more especially of the writer of treatises on the various branches of law and equity to perform the first duty, while to the active practitioners and to the judges emergencies are constantly presented calling for the exercise of the latter function. It may safely be

said that legal maxims play a much less important part in the law than formerly. Generally they have lost whatever character they may have possessed in early times as precise governing rules determining the rights of parties to a litigation. They are now regarded only as convenient forms of expression denoting important legal principles which have many variations or modifications, and consequently are not capable of any complete statement or exposition which at the same time has the convenience of brevity. An important collection of legal maxims was published by Lord Bacon (1596). The latest is that of Broom, *Legal Maxims* (7th ed., London, 1900). Consult also Wharton's *Law Lexicon* (ib., 1902), and *Encyclopædia of the Laws of England* (2d ed., ib., 1908).

MAXIMUS. The name of four Roman emperors.—**MARCUS CLODIUS PULPIENUS MAXIMUS**, elected by the Senate, when he was 74 years of age, as the colleague of Balbinus (q.v.) in 238 A.D., but soon afterward murdered by the prætorian guards. He had won distinction as a soldier and had been proconsul of Bithynia, Achæa, and Gallia Narbonensis.—**MAGNUS CLEMENS MAXIMUS**, born of obscure parentage in Spain. From 368 he held high military rank in Britain, and was proclaimed Emperor by his soldiers, as a result of their disaffection towards Gratian, whom he defeated (383). (See **GRATIANUS AUGUSTUS**.) Theodosius and Valentinianus II were induced to recognize him as their colleague and as Augustus of Gaul, Spain, Britain, etc.; but, when he sought to extend his sway over Italy also, he was, in spite of initial successes, defeated by Theodosius, taken prisoner, and executed (388).—**MAXIMUS TYRANNUS**, proclaimed Emperor in Spain (408) when Gerontius rebelled against the usurper Constantine III. He was deposed on the defeat of Gerontius (411), but again rebelled (418), and was defeated and slain (422).—**PETRONIUS MAXIMUS**, the intimate friend of Valentinianus III, against whom he turned (455), because of the treatment of his wife by the Emperor. He succeeded Valentinianus after his murder in the same year; but at the end of three months Maximus was slain as he was fleeing from an invasion of the Vandals, invited by Eudoxia, the widow of Valentinianus.

MAXIMUS, SAINT, called **CONFESSOR** (c.580–662). An advocate of orthodoxy against the Monothelite heresy. He was born in Constantinople and served the Emperor Heraclius, 610–630, at which latter date he entered the monastery of Chrysopolis (Scutari). He urged Pope Martin I, at the first Lateran Synod, 649, to anathematize the Monothelite doctrine, in which condemnation Heraclius and Constans II were implicated. By command of the latter, Maximus was banished to Thrace, 655; being recalled to Constantinople in 662, he was commanded to accept the Monothelite heresy. Refusing to do so, his tongue was cut out, his right hand cut off, and he was banished to Lazika, Colchis, where he died Aug. 13, 662. He is called among the Greeks Theologos and is venerated as a saint by the Western and Eastern churches. In the Western church his day is August 13; in the Eastern, January 21 and August 12 and 13. He was a voluminous author; his works are in Migne, *Patrol. Græca*, xc–xci.

MAX-MÜLLER, FRIEDRICH. See **MÜLLER, FRIEDRICH MAX.**

MAXWELL, JAMES CLERK- (1831–79). One

of the greatest of modern physicists. He was born in Edinburgh, the only son of John Clerk-Maxwell of Middlebie, Scotland, receiving his early education at the Edinburgh Academy, and his first published scientific paper, *On the Description of Oval Curves*, was read for him by Professor Forbes before the Royal Society of Edinburgh before he was 15. He spent three years at the University of Edinburgh, where he pursued most zealously the study of mathematics, physics, chemistry, and philosophy, devoting considerable time to experimental research. During this period he wrote two valuable papers, *On the Theory of Rolling Curves* and *On the Equilibrium of Elastic Solids*. He went to Cambridge University in the autumn of 1850 and there made a brilliant record as a student, graduating in 1854 with the position of second wrangler and being equal with the senior wrangler in the competition for Smith's prize. In 1856 he became professor of natural philosophy in Marischal College, Aberdeen, and in 1860 professor of natural philosophy in King's College, London. He was successively scholar and fellow of Trinity and became, in 1871, the first professor of experimental physics in the University of Cambridge, a post for which he was in every way preëminently qualified. The Cavendish laboratory was erected and furnished under his supervision. The great work of his life is his treatise on *Electricity and Magnetism* (2 vols., 1873). He had previously, from 1856 onward, published various papers on these subjects, following very closely the experimental procedure of Faraday. Using the discoveries of this great experimenter, Maxwell so connected and arranged them as to make the material available for mathematical discussion and treatment. He early advanced the view that electric or magnetic forces result from changes in the distribution of the energy which is stored up in the ether and are not produced by the attractions of electric or magnetic matter which is distributed over the surfaces of conductors or magnetic substances. He then demonstrated that electromagnetic action traveled through space in the form of transverse waves similar to those of light and having the same velocity. Maxwell's theory was corroborated by Hertz, who not only produced these waves, but showed that they are propagated just as waves of light are, and experience reflection, refraction, and polarization, and he also measured their velocity. Subsequent experiments amply confirmed Maxwell's hypothesis that electricity and light are the same in their ultimate nature. After Maxwell's researches on electricity and magnetism comes his work on color, the well-known Maxwell disks and color box being his inventions. He showed that any given color could be produced by the combination of three colors selected from different parts of the spectrum. These three fundamental colors would correspond to three different sets of nerves or sensations in the eye, each excited proportionately to the amount of its appropriate color in the compound color. The absence of any one set of sensations would occasion color blindness.

A paper on the *Stability of Motion of Saturn's Rings* gained for Maxwell the Adam's prize from the University of Cambridge in 1857 and led to the conclusion that the rings must either be fluid or else consist of a large number of small particles. The kinetic theory of gases was also investigated by Maxwell, and the results of

his study are given in a number of papers in the *Philosophical Transactions*, *Philosophical Magazine*, and the reports of the British Association. Maxwell was a member of the electrical standards committee appointed by the British Association in 1862 and served on a subcommittee to construct the standard of resistance, which was produced from experiments made in his laboratory at King's College. Among his many papers and works a small treatise on dynamics, *Matter and Motion*, will be found of great interest to the general reader, as it contains a clear and comprehensive statement of the principles underlying this science. A memorial edition of Maxwell's scientific papers published by the Cambridge University Press was published in 1890. Consult: Campbell and Garnett, *Life of James Clerk Maxwell* (London, 1882); R. T. Glazebrook, *James Clerk Maxwell and Modern Physics* (ib., 1896).

MAXWELL, WILLIAM BABINGTON (c.1876-). An English novelist, son of M. E. Bradon (q.v.), the novelist, and John Maxwell, a London publisher. He wrote *The Last Man In*, a drama, produced March 14, 1910, at the Royalty Theatre, Glasgow, by the Scottish Repertory Company; and, with George Paston (i.e., Emily Morse Symonds), a farce, *The Naked Truth*, which was first played at Wyndham's Theatre, London, in April, 1910, and in which Charles Hawtrey played Bernard Darrell. His better-known work includes the following novels, mostly pathological in subject, almost all rather sensational (for a British public), but well written and constructed: *The Countess of Maybury* (1901); *Fabulous Fancies* (1903); *The Ragged Messenger* (1904; American ed., 1915), a story of a modern Messiah, which in 1915 was dramatized for Walker Whiteside; *Vivien* (1905), a melodrama of earls and shopgirls; *The Guarded Flame* (1906), a well-documented story of the young wife of an eminent scientist; *Odd Lengths* (1907); *Hill Rise* (1908); *Seymour Charlton* (1909); *The Rest Cure* (1910), a contest between business ambitions and domestic affections; *Mrs. Thompson* (1911), a middle-aged woman in business and in love; *In Cotton Wool* (1912), picturing the degeneracy of the idle rich; *General Mallock's Shadow* (1912), a tale of Yorkshire mill riots; *The Devil's Garden* (1914), which was so frank that the English Libraries' Association refused to handle the book.

MAXWELL, WILLIAM HAMILTON (1792-1850). An Irish novelist, born at Newry, County Down. He graduated B.A. at Trinity College, Dublin, in 1812; served in the Peninsular campaigns and at Waterloo; took orders in the Church of England and was appointed to the rectory of Ballagh in Connemara, in the extreme west of Ireland. As there was no other Protestant in the parish, he devoted himself to sport and to novel writing. He retired from his living in 1844 and settled near Edinburgh, where he died Dec. 29, 1850. Maxwell has a place in the development of English fiction as the founder of the military novel. His best work is represented by *Wild Sports of the West, with Legendary Tales and Local Sketches* (1832), an account of a sporting season in the west of Ireland; *Stories of Waterloo* (1834); *Captain Blake* (1835), a capital story, racy and full of "divilment," of the gentry of western Ireland, from which—and perhaps also from parts of *Wild Sports of the West*—Maxwell's friend Lever probably took the suggestion for his own Irish

novels; *The Bivouac, or Stories of the Peninsular War* (1837). He wrote an autobiography under the title *Rambling Recollections of a Soldier of Fortune* (1842) and a popular life of Wellington (1839-41).

MAXWELL, WILLIAM HENRY (1852-1920). An American educator, born at Stewartstown, County Tyrone, Ireland, and educated at Queen's University (Ireland). He came to America in 1874, was a teacher in the Brooklyn night schools, became assistant superintendent of Brooklyn schools in 1882, superintendent in 1887, and in 1898 was made superintendent of all the schools in Greater New York. Especially interested in the teaching of English, he published English grammars. He urged a State requirement of college education for public-school teachers and raised the requirements in teachers' examinations. His policies often brought him into conflict with Thomas W. Churchill, who became president of the Board of Education in 1913.

MAXWELL, SIR WILLIAM STIRLING. See STIRLING-MAXWELL.

MAY. See MAY-DAY; MONTH.

MAY, CAPE. See CAPE MAY.

MAY, EDWARD HARRISON (1824-87). An American figure and portrait painter, born in London. He was brought to America when a child and first studied under Daniel Huntington. Afterward he studied with Couture in Paris and made his home there. His pictures are usually large canvases of the academic type, excellent in draftsmanship and composition and warm in color, but lacking in personal expression. They include "The Dying Brigand" (1855), in the Pennsylvania Academy, and "Mary Magdalen at the Sepulchre" (1873), in the Metropolitan Museum, New York. His portraits include those of Laboulaye (1866) and of Anson Burlingame (1869).

MAY, FIELD OF. See CHAMP DE MARS.

MAY, JOHN WILDER (1819-83). An American lawyer, born at Attleboro, Mass. He graduated at the University of Vermont in 1846, was admitted to the Massachusetts bar in 1851, and practiced in Roxbury and Boston. In 1867 he was elected to the Legislature and became district attorney of Suffolk County. May was judge of the Boston municipal court (1873); editor of *Angell's Limitations* (1876), *Greenleaf's Evidence* (1876), and *Stephen's Digest of the Law of Evidence* (1877); and author of *The Law of Insurance* (1874-82, and often) and *The Law of Crimes* (3d ed., 1905).

MAY, LYOFF. See MEI, L. A.

MAY, PHIL (1864-1903). An English illustrator and caricaturist, born in Leeds. He started to earn his living at 12 and was self-taught in art. After spending several years with a company of wandering actors, he went to London in 1882 and attracted attention by his drawings in *St. Stephen's Review*, and in 1884 went to Australia, where he worked on the *Sydney Bulletin* until 1889. In 1892 he published *The Parson and the Painter*, a series of remarkable sketches. Later his work was produced in the *Daily Graphic*, *Black and White*, the *Graphic* (for which he traveled in America), and the *Sketch*; and in 1895 he took Du Maurier's place on the staff of *Punch*. By the elimination of every unnecessary line, by a felicitous composition, a high technical excellence in the use of light and shade, keenest observation and unflagging humor, May achieved high rank among celebrated English caricaturists. His specialty

is East London, the types he made famous are the frequenters of the race course, the prize ring, and the stage, and the "guttersnipes," the children of the slums. *Phil May's Gutter-Snipes* (1896), a collection of drawings, contains much of his best work. In these his talent is at its ripest, and the quality of sympathy and kindness, never lacking in his conception, is especially prominent. Other publications by him are *Phil May's Annual* from 1892 and *Phil May's Sketch Book*, 50 cartoons (1897). *The Phil May Folio*, with a biography of the artist, was published in 1903.

MAY, SAMUEL JOSEPH (1797-1871). An American reformer, prominent as an abolitionist in the antislavery struggle. He was born in Boston; graduated at Harvard in 1817; studied for the ministry in the Harvard Divinity School under Dr. Ware; was ordained in 1822; and soon afterward became pastor of the Unitarian Church in Brooklyn, Conn. In 1830 he became a disciple of William Lloyd Garrison and in 1832 joined the first New England antislavery society. When Prudence Crandall (q.v.) was persecuted for opening her school at Canterbury, Conn., to girls of negro blood, he became her friend and champion and later gave her advice and assistance when she was arrested and imprisoned. In the same year, 1833, he was a delegate to the convention at Philadelphia which founded the first American antislavery society and was made one of the vice presidents. In 1834 he resigned his pastorate and became general agent of the Massachusetts Antislavery Society. In October, 1835, while giving a series of lectures in Vermont, May was five times mobbed, once while addressing an audience in the hall of the House of Representatives at Montpelier. The next year he became pastor of the Unitarian Church in South Scituate, Mass., and remained there until 1842, when he took charge for three years of the Girls' Normal School at Lexington, Mass. In 1845 he became pastor of a Unitarian society at Syracuse, N. Y., and continued to hold that position until three years before his death. In 1851 he assisted in the famous rescue of the slave "Jerry," and for this offense against the Fugitive Slave Law he and 17 others were arrested on warrants issued by the United States District Court at Auburn. Anxious to test the question before the courts, May and two other participants in the rescue issued a public declaration to the effect that they had assisted in the rescue of Jerry, that they were ready to stand trial, but would base their defense upon the "unconstitutionality and extreme wickedness of the Fugitive Slave Law." They were, however, never brought to trial. He was one of the conductors of the Underground Railroad. By temperament May was averse to strife and possessed a sunny temper and a gentle disposition, but, being, in his own words, "a Unitarian, a nonresistant, a woman's rights man, an anti-capital-punishment man, and a Garrison abolitionist," it fell to his lot to be engaged in many controversies. The historian Rhodes refers to him as a "rare combination of perfect courage and gentleness of spirit." He published an interesting volume entitled *Some Recollections of our Anti-Slavery Conflict* (1869). Consult Mulford (ed.), *Memoir of Samuel Joseph May* (Boston, 1873; new ed., 1882).

MAY, THOMAS (1595-1650). An English historian and poet. He was born at Mayfield, Sus-

sex, England, of an ancient family; graduated B.A. from Sidney Sussex College, Cambridge, in 1612; became a member of Gray's Inn, London, and was admitted to the bar, but, owing to a defect in his speech, did not practice law. He devoted himself to literature and published the tragedies of *Antigone* and *Agrippina*, a comedy entitled *The Heir*, and other works. By special command of Charles I, with whom he was a favorite, he wrote a metrical history of the reigns of Henry II and Edward III. He translated into English verse *Selected Epigrams of Martial*, Vergil's *Georgics*, and Lucan's *Pharsalia*, to the last of which he wrote a continuation in English and Latin. During the Parliamentary troubles he became a Republican. He was secretary to Cromwell during the Civil War and was employed to write its history. Published originally in Latin, and translated into English in 1650, his *History of the Long Parliament* was edited by Baron Masères and translated into French by Guizot (1812; new ed., 1853); and this was followed by *A Breviary of the History of the Parliament of England*, a partisan account of the Civil War. May died Nov. 13, 1650, and was buried in Westminster Abbey, but soon after the Restoration his body was disinterred and thrown into a pit in the adjoining St. Margaret's churchyard.

MAY, THOMAS ERSKINE, LORD FARNBOROUGH (1815-86). An English constitutional jurist. He was born in London, Feb. 8, 1815, was educated at Bedford School, became assistant librarian of the House of Commons in 1831, and entered the bar in 1838. In 1844 he published a treatise on the *Law, Privileges, Proceedings, and Usages of Parliament* (10th ed., 1893), which has become a standard authority on parliamentary law and has been translated into French, German, Hungarian, Italian, Spanish, and Japanese. In 1846 he was made examiner of petitions for private bills and the next year he was appointed taxing master to the House of Commons, of which he became clerk in 1871. In 1861-63 he published *The Constitutional History of England since the Accession of George III, 1760-1860*. This learned and impartial work is supplementary to Hallam's. He also published *Democracy in Europe: A History* (1877) and contributed to the *Edinburgh Review*, to the *Law Magazine*, and to other periodicals. He was president of the Statute Law Revision Committee, 1866-84. He resigned the clerkship of the House of Commons in April, 1886, and was created Baron Farnborough, only a few days before his death, at Westminster Palace, May 17, 1886.

MAY, SIR WILLIAM HENRY (1849-). An English admiral. He entered the navy at 14 and passed through the grades of lieutenant (1871), commander (1881), captain (1887), rear admiral (1901), vice admiral (1905), and admiral (1908) to admiral of the fleet in 1913. He was a member of the Arctic expedition of 1875-76; became director of naval ordnance and a lord of the Admiralty in 1901; commanded the Atlantic fleet from 1905 to 1907; was second sea lord in 1907-09; commanded the home fleet for two years; and then was commander in chief at Plymouth from 1911 to 1913.

MAYA, mā'yā. The civilized native race of the peninsula of Yucatan, Mexico, the most important of the cognate peoples constituting the Mayan stock (q.v.). In 1511 a Spanish ship was wrecked off the coast of Yucatan and two of its

men were saved. Grijalva and Cortés made landings at the sacred island of Cozumel in 1518 and 1519. Attempts at conquest, begun in 1526, were not successful till 1541, when Montejo founded Mérida. The country was mapped out into tribute districts; missionaries began to Christianize the natives, and in their zeal destroyed as heathen abominations the native temples and records wherever found. Resistance was crushed out by wholesale massacres and the Maya sovereignty was at an end. The warlike Itzá (q.v.), who had previously retired beyond the Guatemala border, maintained their independence until 1697. In 1848 occurred a general rising throughout the peninsula, the Indians seizing the opportunity afforded by internal troubles in Mexico. Massing their forces in thousands, they took one city after another, burning and destroying everything and consigning to indiscriminate massacre whole garrisons and populations. The entire strength of the Mexican government was invoked to put down the rebellion. The Maya of the northern and central area were finally subdued, while the more determined warriors retired to the difficult region along the southern coast, where they continued to defy the Mexican armies for more than half a century, while maintaining friendly relations with the English of Belize, from whom they obtained their firearms and ammunition. In 1901 the Mexican military force made a determined effort to put down the rebellious Maya and succeeded in capturing their stronghold, Chan Santa Cruz, but owing to covert hostility the eastern part of the Yucatan peninsula north of British Honduras and south of Valladolid is still closed territory. The Lacandonés is a small group of Maya who have reverted to the wild and who preserve their pagan religion. The present number of those speaking the Maya language is about 300,000, about one-third of whom are mixed bloods, or persons of European descent who have adopted the language as their own. For general characteristics and archaeological history, see MAYAN STOCK; MEXICAN ARCHEOLOGY.

MAYÁGUEZ, mā-yā'gwás. The capital of the Department of Mayáguéz, and the third largest city in Porto Rico, situated near the west coast, on the Mayáguéz River (Map: Porto Rico, A 3). It has a healthful climate, with a mean annual temperature of 78° F. There are three public plazas, and its principal buildings are the city hall, hospital, courthouse, and public market. Its harbor is extensive and well sheltered, but is accessible only to vessels drawing less than 16 feet. It has a system of tramways and is connected with the interior of the island by rail. It is an important commercial centre, coffee being the chief article of trade. Its exports, consisting of coffee, sugar, and oranges, go mainly to the United States. The surrounding district contains sugar estates, coffee plantations, and fruit groves. Adjoining the city is the Porto Rico Agricultural Experiment Station, which was established in 1902. Pop., 1910, municipality, 42,429; urban, 16,591. Mayáguéz was established in 1836.

MAYAN (mā'yan) STOCK. A group of cognate tribes or nations occupying the states of Vera Cruz, Yucatan, Campeche, Tabasco, and Chiapas, in Mexico, with the greater part of Guatemala and a small portion of Salvador, and exhibiting in their ancient native culture the highest aboriginal development found upon the

American continent. The stock includes about 20 languages, some with well-marked dialects. The best-known groups are the Maya proper, who occupy the entire peninsula of Yucatan, the Huastec of northern Vera Cruz, the Tzental of Tabasco and Chiapas, the Mam, Chol, Quiché, Cakchiquel, Pokonchi, and Pokomam of the Guatemalan highlands; and the Chorti, who extend into western Honduras. With the exception of the Huastec all of these occupy contiguous territory and were embraced in the sphere of ancient civilization, which, however, seems to have been most highly developed by the Maya tribe proper in the lowland region. It has been estimated that 1,300,000 Indians still speak the Mayan languages. Since the Huastec occupy a lone position in the north it has been argued that the entire Mayan stock had a northern origin. Whatever the merits of this argument may be there is no doubt that the most remarkable features of Maya culture were developed in Central America after the separation of the Huastec from the main body.

Physically the Mayan peoples are dark, short, broad-headed, and muscular. The different tribes cover a great range of environment from the humid lowlands to the cold mountain heights of the cordillera. Agriculture was their main dependence, corn being the principal crop, to which were added beans, peppers, and cacao, the last, together with bells of copper, being used widely as the ordinary standard of value. Bees were domesticated for their honey and wax. Cotton was spun for clothing and dyed and woven into fabrics which rivaled silk in delicacy. The lands were held in common by each village and were parceled out by the chiefs on a basis of a certain corn production per year to each family. Gold, silver, and copper were used for ornamental purposes, but ordinary metal tools were unknown. The Maya of the coast region had large seagoing canoes, with which they carried on a coastwise trade. Descent was generally in the male line, and each village community was governed by a chief who derived his authority from the hereditary ruler of the tribe or province. Traditions make it clear that more centralized governments once existed. In northern Yucatan there was the League of Mayapan, founded in 960, and on the highlands of Guatemala the Quiché and Cakchiquel had a powerful hold over their smaller neighbors.

The Mayan peoples were remarkable above all other cultured American nations for their architecture, their calendar, and their hieroglyphic system. Of their architecture, as exemplified in the great ruins of Palenque, Uxmal, Mayapan, and Chichén-Itzá, with hundreds of lesser cities and isolated temples scattered through the tangled tropical forests, it is unnecessary to speak at length here. The material was usually a hard limestone, embedded in firm mortar, well cut and exactly fitted, and lavishly carved on every part with mythical and historical figures and hieroglyphic inscriptions. Their hieroglyphic records and rituals were carved or painted upon the walls of their temples and palaces or written in books of folded sheets of maguey paper. The explanation of these hieroglyphs is one of the most important problems in American archaeology. In spite of wholesale destruction by the Spanish missionaries and authorities, a few of these ancient sacred books

still remain for study and interpretation, notably the *Codex Troano*, the *Codex Peresianus*, and the *Dresden Codex*, besides a number of others in the Maya language, but in Latin characters, compiled by natives of the Yucatan peninsula later than the Conquest, and usually grouped under the title of "Books of Chilán Balam." Through these books we have been able to connect the ancient dated monuments with our own system of chronology. The Quiché of Guatemala have also their sacred book, the *Popol Vuh*, of which a translation has been made by the Abbé Brasseur de Bourbourg. The calendar system of the Maya, which was practically the same among the neighboring tribes of the same stock, was more elaborate and exact than that of the Aztec tribes. Their year, beginning on July 16, when the sun crossed the zenith, consisted of 365 days, divided into 18 months of 20 days each, the days being grouped into weeks of five days each. At the end of the year there was an interval of five "nameless days" before the beginning of the new year. The years were grouped into *katuns* of 20 years each, the completion of each successive *katun* being signalized by the placing of a commemorative inscribed stone in the wall of the principal temple of the city. In late Maya chronological records the *katuns* are known by the number of the day *ahau* with which they began, and since there were 13 numbers to this day falling in a definite order, the great time cycle was 260 years. A more accurate calendar was used on the ancient monuments in which the *katuns* were recorded in a different manner. All the early dates were calculated from a beginning day and a serial number for each subsequent day was used.

Much attention has been given to the Maya languages, owing to the literary tendency, cultural superiority, and numerical strength of the people using them. Compared with other Indian languages they are comparatively simple in structure. The Maya itself forms one of the few American languages which have enough vitality not only to hold their own but even to force themselves on European settlers and supplant their own speech. In Yucatan whole families of pure white blood are found who known no Spanish, using the Maya exclusively. The earliest Maya grammar is that of Father Villalpando, published about 1555. The first dictionary is also by him, published in 1571. There is also the Maya-Spanish Dictionary of Perez, 1877, with about 20,000 words, and the manuscript Dictionary of the Convent of Motúl, in three large quarto volumes, in the Carter Brown Library of Providence. Great strides have been made in recent years in the study of codices, inscriptions, graphic art, and architecture of the Maya, with the result that the history has been pushed back to before the time of Christ. On the hieroglyphs two excellent studies are the *Commentary on the Dresden Codex* by Förstemann and the *Numerations, Calendar Systems, and Astronomical Knowledge of the Mayas* by Bowditch. The exuberant art passed through a series of remarkable changes, from which the historical sequence has been determined. This sequence is found to agree with the dates carved on the monuments in the Maya system of counting time. On this subject, see *Maya Art* by Spinden and various papers by Morley, explaining the correlation of the calendar with

our own time system. The great cities have been separately described in *Memoirs of the Peabody Museum of Harvard University* (Cambridge, Mass., 1904 et seq.), and in the four volumes on archaeology by A. P. Maudslay in *Biologia Centrali-Americana* (London, 1899-1902). For a summary of the history, see MEXICAN ARCHAEOLOGY. See also CHICHÉN-ITZÁ; CHILÁN BALÁM; KATUN; POPOL VUH; ARCHAEOLOGY, AMERICAN.

MAY APPLE. A North American perennial herb. See MANDRAKE; PODOPHYLLUM.

MAYBACH, mī'bāg, ALBERT VON (1822-1904). A Prussian administrator, born in Werne, Westphalia. He entered the governmental employ in the department of railroads (1854), of which he became head in 1874, when he urged the control of all railroads by the Empire. The success of this measure and the defeat of the movement for private control in the early 80's was due largely to him. In 1878 he became Secretary of Commerce and in 1879 Secretary of Public Works and President of the Railways in Alsace and Lorraine. He resigned from his executive positions in 1891. From 1882 to 1893 he was a member of the Prussian House of Deputies. Emperor Frederick III decorated him with the cross of the Black Eagle in 1888.

MAY BEETLE. See JUNE BUG.

MAY BIRD, or MAY COCK. The name of several birds which appear in May; especially, among American sportsmen, the knot (q.v.). In New England the black-bellied plover (q.v.) is locally called May cock, but in Great Britain and the southern United States a curlew is meant by this term.

MAY DANCE. A very popular old dance formerly much performed throughout England upon the first of May to celebrate the return of spring. The celebration of May Day with a dance is an old custom, being possibly of Swedish or Gothic origin, but more probably from Roman (its prototypes being the Floralia and the Lupercalia) or Egyptian and Indian sources. In England the dance was a composite one, in which the morris dance (q.v.) played an important part. There was also a milkmaids' dance, and the characters of Robin Hood, Maid Marian, Scarlet, Little John, Tom the Piper, the Hobby Horse, the Lord and Lady of the May, all joined in the various dances which centred around the May pole. See MAY DAY.

MAY DAY (OF., Fr. *mai*, from Lat. *Maius*; connected with OLat. *majus*, great, Lat. *magnus*, Gk. μέγας, *megas*, Goth. *mikils*, great Skt. *mah*, to be great). The name popularly given to the first day of May, which among the Germanic and Latin peoples has been associated from an early period with festal ceremonies religious in origin. It was long the custom on this day to start before dawn, make excursions to the woods and fields, and return laden with green flowering boughs. It is plain that this festival, which was celebrated by all classes alike, represented the continuance of an ancient pagan ceremony; and there seems to be reason for regarding it as a survival of rites originally offered to the Roman goddess Maia (q.v.), who was evidently worshiped as the principle and cause of fertility. Although recorded testimony does not enable us to reconstruct the details of her ceremony, it is possible that one essential feature was a ritual marriage to a partner who represented the male element of

growth, whence arose habitual acts of license, which were not repugnant to early moral sentiment. Songs and dances, and performances more or less dramatic in character, which were usual on similar occasions, and are reminiscent of the same spirit, have continued in popular use to our own day, as the familiar English game of children, "Here oats, peas, beans, and barley grows." The actual basis of May Day seems to have been the Roman Floralia, celebrated April 28 to May 3, and instituted at Rome, in the year 238 B.C., on account of a bad harvest. Flora (q.v.), to whom the feast was consecrated, was likewise a fertility goddess, and it may be taken for granted that the elements of her rite were similar to customs which had previously been associated with Maia. Among observances of the Floralia are mentioned gay costumes, dramatic performances, and dances described as frequently indecent. In the mediæval May festival an important feature consisted in a nocturnal expedition to the forest, whence branches were brought and afterward attached to doors. The bushes brought home were planted in the streets, and a lover might thus honor the residence of his mistress. Corresponding to this act of "bringing in the May" (see below), it was usual for the young men of the village to fetch from the wood a tree, the tallest and straightest which could be procured. This was stripped of its boughs, planted in the public green, decorated with garlands and ribbons, painted with gay stripes, and became the centre of dances and games having for the most part an amatory character. The tree thus obtained, as well as the branches of individual celebrants, was called simply "the May"; in England, the white-flowering hawthorn, especially, received this title. A Maypole, once introduced, might remain for many years, and annually be made the focus of popular amusements. With the season continued to be associated theatrical performances. These were frequently of a comic nature, and might be crowded with local jests and personal allusions often of a scurrilous sort, as may be seen from the pastoral of Adam de la Halle, *Le jeu de Robin et de Marion*, composed in the thirteenth century for use on such an occasion. In England the story of Robin Hood (q.v.) was connected with the May games, and the personages of his cycle were introduced into the performances of costumed or masked actors, called morris dancers. (See MORRIS DANCE.) In the Highlands of Scotland and in Ireland the first of May received the name of Beltane (q.v.), and was originally, no doubt, an independent ceremony. Customs analogous to May Day are widespread, in America as well as in Europe. Among the Russians there is a spring festival, celebrated by the boys and girls with a choral dance called Khorovod. (See SLAVONIC MUSIC.) The European springtide feast seems to have come from the Orient, where orgiastic merriment was common in the spring. So in modern India the Holi festival is celebrated in March or April with the singing of songs generally obscene and with the sprinkling with red powder and water or with filth. The naturalistic basis of the custom is joy at the creative impulses felt in the spring and manifested both in the vegetable and the animal world. Hence comes the erotic character of the songs and dances, while the Maypole itself is probably phallic in origin. Consult J. Strutt, *Sports and Pas-*

times of the People of England (London, 1801). See PHALICISM; SPORTS, BOOK OF.

MAYEN, mî'en. A town in the Prussian Rhine Province, Germany, on the Nette, 15 miles west of Coblenz (Map: Germany, B 3). It has a late Gothic church, ancient walls, and a partly preserved castle of the Middle Ages. Cloth, tobacco, hats, oil, basalt, and leather are manufactured, and there is trade in millstones and wine. Pop., 1900, 11,961; 1910, 14,421.

MAYENCE, mǎ'yǎns'. A town of Germany. See MAINZ.

MAYENNE, má'en'. A department of northwestern France, traversed by the River Mayenne, a tributary of the Loire (Map: France, N., E 4). It was formerly part of the Province of Maine. Area, 2012 square miles. Its surface is mostly rolling, becoming hilly towards the northeast and culminating in the Mont des Avaloirs. Its fertile soil produces grain, flax, hemp, and apples; there are deposits of coal, iron, marble, and slate. A large number of swine, cattle, and fine horses are reared and dairy goods are produced. Much timber is cut. Pop., 1901, 313,103; 1911, 297,732. Capital, Laval.

MAYENNE. A town in the Department of Mayenne, in the northwest of France, pleasantly situated on the Mayenne, a tributary of the Loire, 19 miles north-northeast of Laval. Its streets are steep, narrow, and crooked; it has an old castle, a twelfth-century church, a school of agriculture, and a museum. It has manufactures of iron, vehicles, calico, and linen, and trades chiefly in horses and grain. Pop. (commune), 1901, 10,125; 1911, 9961.

MAYENNE, DUKE OF. See GUISE.

MAYER, ALFRED GOLDSBOROUGH (1868-). An American zoölogist, born at Frederick, Md. He graduated from the Stevens Institute of Technology (M.E., 1889) and from Harvard University (S.D., 1897), where he was an assistant to Dr. Alexander Agassiz from 1892 to 1900 and had charge of the radiates in the Museum of Comparative Zoölogy. He served as curator of natural sciences and curator in chief of the museum of the Brooklyn Institute of Arts and Sciences in 1900-04; was director of the Marine Laboratory of the Carnegie Institution in the Tortugas, Fla., in 1904-05; and was director of the department of marine biology at the Carnegie Institution, Washington, after 1905. He lectured also on biology at Princeton University in 1910-11. At various times he was a member of scientific expeditions to many parts of the world. He is author of *Medusæ of the World* (3 vols., 1910).

MAYER, ALFRED MARSHALL (1836-97). An American physicist. He was born at Baltimore and was educated at St. Mary's College, Baltimore. In 1856 he was appointed professor of physics and chemistry in the University of Maryland and subsequently held positions in the Westminster College in Missouri, in Pennsylvania State College, in Lehigh University, and in the Stevens Institute of Technology. In 1863 he went to Paris, where he spent two years in study and research, working under the famous physicist Regnault. He was for a time one of the editors of the *American Journal of Science* and contributed a number of papers to its pages. In 1872 he was elected a member of the National Academy of Sciences. After assuming the professorship of physics at Stevens Institute (1871) he devoted himself to acous-

tics, in which field he performed many new and interesting experiments and made some valuable discoveries. His most important work in acoustics, perhaps, was the determination of the law connecting the pitch of a sound with the duration of the residual sensation in the ear. To Professor Mayer were also due a method of determining the comparative intensity of sounds with the same pitch, and the location of the organs of hearing in the mosquito. He developed new methods for analyzing sound and he made researches into the nature of electricity, besides being the first to give accurately the temperature correction for tuning forks. An early paper on the *Thermodynamics of Waterfalls* (1869) aroused considerable interest, and one on the variation of the elasticity of metals with change of temperature showed the delicacy of Professor Mayer's experimental work. His last important research was an experimental investigation of the equilibrium of the forces acting in the flotation of disks and rings of metal and their application to measure surface tension. In addition to his scientific attainments Professor Mayer was an enthusiastic sportsman and wrote *Sport with Gun and Rod in American Woods and Waters* (1883). Consult short biographical sketch in *Science*, Aug. 20, 1897, by W. LeConte Stevens. Besides many contributions to scientific journals and encyclopædias, Professor Mayer was the author of *Lecture Notes on Physics* (1868); *The Earth a Great Magnet* (1872); *Light* (1877), with Charles Barnard; *Sound* (1878).

MAYER, BRANTZ (1809-79). An American author, born in Baltimore, Md. After graduation at St. Mary's College he traveled in the East, practiced law (1829-41), was secretary of the American Legation at Mexico (1843), and wrote his observations there in *Mexico as it Was and Is* (1844); *Mexico, Aztec, Spanish, and Republican* (1851); *Observations of Mexican History and Archaeology* (1856); *Mexican Antiquities* (1858)—works that retain some value, especially for the period following the Spanish Conquest. He wrote also *Captain Canot, or Twenty Years of an African Slaver* (1854) and other less important books. Mayer served as paymaster in the Civil War and was a founder of the Maryland Historical Society (1844). He died in Baltimore.

MAYER, m'ér, JOHANN TOBIAS (1723-62). A German mathematician and astronomer, born at Marbach in Württemberg. He was self-educated and at first taught mathematics for a living. In 1746 he became connected with a cartographic establishment and gained fame for his improvements in map making. In 1751 he was appointed to the chair of mathematics and astronomy in the University of Göttingen and in 1754 became director of the observatory, where for the remainder of his life he did much to advance the sciences of astronomy and navigation. His first published work was a treatise on curves, which was followed the same year (1745) by his *Mathematischer Atlas*, a sort of résumé of mathematics in 60 tables. At Göttingen he gave much labor to a *Zodiacal Catalogue*, which contains 998 stars and of which a newly computed edition was published by Auwers in 1894. His *Lunar Tables*, published in 1752-53, were so correct as to be adopted by the British Board of Admiralty. In 1760 he invented the repeating circle, which was afterward used with so much success by Borda in measuring the arc

of the meridian. His posthumous works include: *Theoria Lunæ juxta Systema Newtonianum* (1767); *Tabulæ Motuum Solis et Lunæ Novæ et Correctæ Quibus Accedit Methodus Longitudinum Promota* (1770); *Observationes Astronomiæ Quadrante Murali Habite in Observatorio Goettingensi* (2d ed., 1826). He left a large number of scientific memoirs, which were published by Lichtenberg in 1775.

MAYER, JULIUS ROBERT VON (1814-78). A German physicist, born in Heilbronn, Württemberg. He attended the Gymnasium at Heilbronn, studied medicine at Tübingen, and finished his university course at Munich and Paris. He made a voyage to Java in 1840 and while there made observations on the blood which led him to the investigation of the subject of animal heat and finally to that of the conservation and correlation of forces. After his return to Heilbronn he practiced medicine there, but after a few years devoted himself almost exclusively to his scientific investigations. He published a preliminary notice of his work up to 1842, in Liebig's *Annalen der Chemie und Pharmacie*, under the title "Bemerkungen über die Kräfte der unbelebten Natur," after it had been refused by Poggendorff's *Annalen* on account of its novel and revolutionary character. It was in this paper that the first announcement was made of the principle underlying the theory of the conservation of energy. In 1845 he made a fuller explanation of the subject in a memoir, under the title *Die organische Bewegung in ihrem Zusammenhange mit dem Stoffwechsel*. In 1848 he published *Beiträge zur Dynamik des Himmels*, and in 1851 the essay for which he is perhaps more generally known in popular science, that upon the mechanical equivalent of heat (*Bemerkungen über das mechanische Aequivalent der Wärme*), in which he developed and expanded the principles laid down in his former papers. This paper it is interesting to note was written about the time of a mental derangement from which he never fully recovered. To Mayer is due the first conception of the doctrine of the conservation of energy, though he was soon followed by Joule and Helmholtz (qq.v.) with investigations and papers on the same subjects. His collected works appeared under the title *Die Mechanik der Wärme* (3d ed., by J. S. Weyrauch, 1893). Consult: Weyrauch, *Robert Mayer* (Stuttgart, 1890); id., *Kleinere Schriften und Briefe von Robert Mayer* (ib., 1893); Gross, *Robert Mayer und Hermann von Helmholtz* (Berlin, 1898); Ernst Jentsch, *Julius Robert Mayer; seine Krankheitsgeschichte und die Geschichte seiner Entdeckung* (Berlin, 1914).

MAYERS, WILLIAM FREDERICK (1831-78). A Sinologue, born in Tasmania. Educated in Marseilles and proficient in modern languages, at 28 he was appointed student interpreter in China and acted as Vice Consul at Canton and Chifu, becoming in 1872 Chinese Secretary to the British Legation in Peking. He was a master of Chinese, Tibetan, and Korean. He published "The Lamaist Septem in Tibet," in the *Journal of the Royal Asiatic Society* (1869); *The Anglo-Chinese Calendar Manual* (1869); *The Chinese Reader's Manual* (1874), his masterpiece; *The Chinese Government, a Manual of Chinese Titles* (1878); *The Treaty Ports of China* (1867), in collaboration with Dennys and King. He procured for the British Museum one of the few extant copies of the great Im-

perial cyclopædia of Chinese literature in 5020 volumes.

MAYFAIR. One of the most fashionable sections of London. It lies east of Hyde Park, between Park Lane and Bond Street, and derives its name from a fair formerly held in the locality during May.

MAYFIELD. A city and the county seat of Graves Co., Ky., 25 miles south of Paducah, on the Illinois Central Railroad (Map: Kentucky, B 6). It controls a large trade in tobacco, having large warehouses and a number of rehandling concerns, and there are flouring, planing, and woolen mills, tobacco and clothing factories, etc. Settled about 1820, Mayfield was incorporated some six years later. The government is administered under a charter of 1893, by a mayor, chosen every four years, and a unicameral council. Pop., 1900, 4081; 1910, 5916.

MAYFIELD. A borough in Lackawanna Co., Pa., about 14 miles northeast of Scranton, on the Delaware and Hudson and the New York, Ontario, and Western railroads (Map: Pennsylvania, K 3). The borough contains a silk mill, but coal mining is the chief industry. Pop., 1900, 2300; 1910, 3662.

MAYFISH. The most common of American killifish (*Fundulus majalis*). See KILLIFISH.

MAYFLOWER. See ARBUTUS, TRAILING.

MAYFLOWER, THE. A ship of 180 tons' burden, hired to take the Pilgrims from Southampton, England, to the New World in 1620. Some had sailed from Delftshaven in the *Speedwell*, which started with the *Mayflower* but put back after several days. The *Mayflower* arrived at Plymouth December 11, or 21 N. S. (anniversary celebrated December 22).

MAYFLOWER DESCENDANTS, SOCIETY OF. An organization founded in the city of New York Dec. 22, 1894, by lineal descendants of the *Mayflower* pilgrims, "to preserve their memory, their records, their history, and all facts relating to them, their ancestors and their posterity." Every lineal descendant over 18 years of age, male or female, of any passenger of the voyage of the *Mayflower* which terminated at Plymouth, Mass., December, 1620, including all signers of "the Compact," is eligible to membership.

The General Society of Mayflower Descendants was organized at Plymouth, Mass., in 1897. A triennial congress is held in September at Plymouth, Mass. Societies have been organized in New York, Connecticut, Massachusetts, Pennsylvania, Illinois, District of Columbia, Ohio, New Jersey, Wisconsin, Rhode Island, Michigan, Maine, Colorado, California, Washington, and Kansas.

MAY FLY. An insect of the order Ephemera, sometimes also called shad fly and day fly, the latter, like the scientific name, derived from the ephemeral life of the adult. They have short antennæ, very large fore wings, very small hind wings, absolutely atrophied mouth parts, and two or three long, slender filaments at the end of the abdomen. The transformations are complete and the early stages are passed in the water. The larvæ are active, possess long and strong legs, and breathe by means of tracheal gills. They are found under stones in running streams or swimming among water plants in quiet waters, or they may live at the bottom, more or less covered with slime or mud; some forms also burrow into the sand banks of rivers. They both swim and crawl, and they feed largely

upon vegetable matter. The pupa, or nymph, is also active and feeds. It has small wing pads, and when ready to transform it floats at the surface of the water and the subimago issues through the skin of the thorax. The emergence is very rapid, and the subimago flies away almost immediately after the skin cracks. The existence of a subimago stage is peculiar to this order of insects, and there is a subsequent molt after the subimago reaches the shore, the true imago issuing from the skin of the subimago. The May flies differ from all other insects not only in this additional transformation, but also in possessing paired sexual organs which open to the exterior by separate orifices. The life of the adult insect is very short, but the popular idea that they live but a day is erroneous. Curtis kept one alive three weeks. Most species couple during flight, and egg-laying is usually performed in fresh water, where the egg clusters disintegrate and the eggs sink to the beds of the rivers and streams. The larval life lasts from one to three years, and the larvæ form a favorite food for many food fishes. The adults are also eagerly sought for by fish, and many of the artificial flies, especially those forms known as duns, drakes, and spinners (see FLY CASTING), are imitations of May flies. About 300 species have been described—85 from temperate North America. They are strongly attracted to light and fly in enormous numbers, so that they sometimes half fill the globes of electric street lamps with their bodies in a single evening, and greatly trouble lighthouse keepers, especially along the Great Lakes, by swarming about the lantern in such crowds as to obscure the light.

MAYHEM, mā'hēm (archaic form of *māim*, from OF. *mahaigner*, *meahaigner*, to maim). At common law, the offense of so maiming another, or doing such violence to his members, as to render him the less able in fighting either to defend himself or to annoy his adversary. It renders the wrongdoer liable to a civil action for damages by the injured person and also to a criminal prosecution as "an atrocious breach of the King's peace, and as tending to deprive him of the aid and assistance of his subjects." Destroying or disabling an arm or leg, hand or foot, putting out an eye, or breaking a front tooth, is a mayhem. It is a felony punishable by penal servitude or imprisonment for a term of years. See MAIMING.

MAYHEW, mā'hū, AUGUSTUS SEPTIMUS (1826-75). An English journalist and author, born in London. He wrote in collaboration with his brother Henry such works as *The Greatest Plague of Life, or the Adventures of a Lady in Search of a Good Servant* (1847, illustrated by George Cruikshank), and he joined H. S. Edwards in the production of such farces as *The Goose and the Golden Eggs* (Strand Theatre, 1859); *Christmas Boxes* (Strand, 1860); *The Four Cousins* (Globe Theatre, 1871). From 1848 to 1850 he edited *The Comic Almanac*, to which he had been a contributor since 1845, and his individual productions include *Paved with Gold, or the Romance and Reality of the London Streets* (1857) and *Faces for Fortunes* (3 vols., 1865). See MAYHEW, HENRY.

MAYHEW, EXPERIENCE (1673-1758). A New England divine. He was born in Martha's Vineyard, Mass., the oldest son of Rev. John Mayhew, missionary to the Indians, and great-grandson of Gov. Thomas Mayhew. He began to preach to the Indians at the age of 21, and

had the oversight of five or six Indian assemblies, which he continued for 64 years. Having thoroughly mastered the Indian language, which he had learned in infancy, he was employed by the Society for the Propagation of the Gospel in New England to make a new version of the Psalms and of the Gospel of John, which he did in 1709 in parallel columns of English and Indian. He published *Indian Converts* (1727), comprising the lives of 30 Indian preachers and 80 other converts, besides a volume entitled *Grace Defended*. Consult Hallock, *The Venerable Mayhew and the Aboriginal Indians of Martha's Vineyard*, condensed from Rev. E. Mayhew's *History of Indian Converts* and brought down to date (New York, 1874).—His son, JONATHAN, was distinguished as a preacher and patriot (see MAYHEW, JONATHAN).—Another son, ZACHARIAH, was missionary to the Marthas Vineyard Indians from 1767 to his death, March 6, 1806.

MAYHEW, HENRY (1812–87). An English author, son of a London attorney. From Westminster School he ran away to sea, making a voyage to Calcutta. On his return he was articulated to his father for three years. In conjunction with Gilbert & Beckett, he started the *Figaro in London*, a comic weekly (1831–39), and *The Thief* (1832), "a paste and scissors" journal, and was one of the founders of *Punch* (1841). He made a hit with *The Wandering Minstrel*, a one-act farce (1834), which was followed by *But However* (1838), written in conjunction with Henry Baylis. With his brother AUGUSTUS (1826–75) he wrote several clever fictions, as *The Greatest Plague of Life* (1847); *The Good Genius that Turned Everything to Gold* (1847), a fairy tale; *Whom to Marry* (1848); *Living for Appearances* (1855). His most important work was a series of articles in collaboration with John Binny, written to make known the actual condition of the lower classes in London. Originally appearing in the *Morning Chronicle*, they were collected in 1851 under the title *London Labour and the London Poor*. In 1856 the series was continued in monthly numbers with the title *The Great World of London* (completed and published in 1862 as *Criminal Prisons of London*).—His brother HORACE (1816–72) was also a well-known humorist. He wrote farces and tales and was for a time subeditor of *Punch*.

MAYHEW, JONATHAN (1720–66). An American clergyman and patriot of the Revolutionary War, born on the island of Marthas Vineyard, Mass. He graduated at Harvard in 1744, studied theology, and from 1747 until his death was pastor of the West Church (Congregational), Boston. He became one of the best-known preachers in New England and his influence on the political views and theories of the colonists in the pre-Revolutionary period was probably greater than that of any other clergyman. Dr. Mayhew was an ardent believer in the rights of the American Colonies and expressed his views with great boldness from his pulpit. In January, 1750, he preached a sermon on the execution of Charles I, in which he declared that all allegiance was limited by certain inalienable rights that could not be abrogated by the sovereign without giving a corresponding right of abrogation to the subject. His fearlessness led to his being bitterly attacked by the Tories, who charged him, without warrant, with being the instigator of the

Boston Stamp Act riots that resulted in the sacking of Governor Hutchinson's house. In May, 1766, he preached a Thanksgiving sermon for the repeal of the Stamp Act that was a remarkable plea for civil and religious liberty. Later in the same year and during a fatal illness he wrote to James Otis (q.v.) a letter which probably contains the earliest suggestion of a union of all the Colonies. The subsequent institution of committees of correspondence undoubtedly had its inception in Dr. Mayhew's plan. His sermons were published separately in pamphlet forms and in collections. Among them were: *Seven Sermons* (1749); *Discourse Concerning Unlimited Submission and Non-Resistance to the Higher Powers* (1750); *Sermons* (1756); *Sermons to Young Men* (1767). Consult Alden Bradford, *Memoir of the Life and Writings of the Rev. Jonathan Mayhew* (Boston, 1838).

MAYHEW, THOMAS (1593–1682). An American Colonial governor. He was born in England and was a merchant in Southampton before he emigrated to America in 1631. He settled in Watertown in 1636 or 1637, obtained in 1641 from the agent of Lord Stirling a grant of Marthas Vineyard and the neighboring islands, and in 1642 became both patentee and Governor of the granted district. His son Thomas having been called to the ministry at Edgartown, Governor Mayhew encouraged his work, both by his advice and by inducing the Indian sachems to govern their people according to the English laws. After his son's death Mayhew continued the ministrations and organized an Indian church. For 40 years while he lived among them the English and Indians were at peace. He died in Marthas Vineyard March 25, 1682. Consult C. E. Banks, *The History of Martha's Vineyard* (Boston, 1911).

MAY LAWS. The name applied to a series of laws enacted by the Prussian Diet in May, 1873, marking the opening of the conflict between Church and state generally known as the Kulturkampf (q.v.).

MAYNA, mī'nā, or MAINA. A group of tribes constituting a distinct linguistic stock, upon the Upper Marañon (Amazon) between the Santiago and Pastaza rivers on the Peru-Ecuador frontier. Their language is particularly harsh and difficult. A part were gathered in missions during the eighteenth century, but the majority are still wild and unsubdued, living by hunting and fishing. The name is also frequently used collectively to include all the tribes of the Ucayali and Huallaga region, the former Peruvian Province of Maynas.

MAYNARD. A town in Middlesex Co., Mass., 28 miles by rail west by north of Boston, on the Assabet River and on the Boston and Maine Railroad (Map: Massachusetts, E 3). The town is engaged chiefly in the manufacture of woollen goods. The water works are owned by the municipality. Pop., 1900, 3142; 1910, 6390.

MAYNARD, EDWARD (1813–91). An American dental surgeon and inventor, born at Madison, N. Y. He entered the United States Military Academy in 1831, but resigned and took up the profession of dentistry, which he practiced from 1836 to 1890, at Washington. His contribution to the profession included many improvements in operative methods, especially in the filling of teeth. He became a member of the faculty of the Baltimore College of Dental Surgery and of George Washington University. It is

with improvements in the construction of fire-arms, however, that his name is usually associated, his first important invention (1845) being a system of priming which practically superseded the percussion cap. In 1851 he patented a breech-loading rifle, afterward known as the Maynard rifle, and five years later adapted it to the use of the metallic cartridge. In 1860 he patented a method of converting muzzle-loaders into breechloaders. He was granted the Great Medal of Merit of Sweden.

MAYNARD, mā'nār', FRANÇOIS DE (1582-1646). A French poet, born at Toulouse. In 1618 he became president of Aurillac. In 1634 he went to Italy with the Ambassador, De Noailles, but soon quarreled with him. One of the first members of the French Academy, he took little part in its deliberations, since he was practically exiled from Paris by Richelieu. For the wife of Henry IV, Margaret of Valois, to whom he was secretary, he wrote his early poems. He was a disciple of Malherbe (q.v.) and in workmanship excelled Racan (q.v.), although he lacked the power of the latter. In literature he stands between these two. His sonnets, odes, and epigrams were first published as a collection by Gomberville in 1646.

MAYNARD, GEORGE WILLOUGHBY (1843-). An American mural, figure, and marine painter, born in Washington, D. C., the son of Edward Maynard. He studied at the National Academy of Design, New York, and at the Royal Academy of Antwerp, under Van Terins and De Keyser, from whom he acquired great thoroughness of workmanship. In 1878 he opened a studio in Paris; later he settled in New York City. He was elected to the National Academy of Design in 1885 and became a member of the Society of American Artists and of the American Water Color Society. Maynard early devoted himself to decorative painting, and his work may be seen in the Congressional Library at Washington, D. C., in the Appellate Court of New York City, in the Bijou Theatre, Boston, the Metropolitan Opera House, New York (ceiling), and the Essex County Courthouse, Newark, N. J. The brass inlay work in the floor of the entrance hall of the Boston Public Library and in the entrance hall of Columbia University Library, New York, is also by him. Among his best-known canvases are: "Vespers at Antwerp" and "1776," sent to the Centennial Exhibition of 1876; "Venetian Court"; "An Ancient Mariner" (1883); "Strange Gods"; "The Surf" (1904); "The Oceanides" (1911); "Rocks at Ogunquit" (1912); "Flood-Tide" (1912). His Pompeian decorations in the Agricultural Building at Chicago in 1893 were perhaps the most effective in the Exposition Buildings. The Metropolitan Museum in New York possesses his "In Strange Seas" and he is also represented in the collections of the Pennsylvania Academy, the Providence Museum, and the Corcoran Gallery, Washington.

MAYNARD, HORACE (1814-82). An American politician, born in Westboro, Mass. He graduated at Amherst College in 1838 and shortly afterward removed to Knoxville, Tenn., where for some years he was a tutor and then professor of mathematics and natural history in the East Tennessee College. In 1845 he became a lawyer and in 1857 was elected by the "Americans" (see AMERICAN PARTY and KNOW-NOTHINGS) to Congress, where he continued to sit until 1863. Like Andrew Johnson, W. G. Brownlow, and

others, Maynard strove hard but unsuccessfully to keep Tennessee in the Union, and because of his loyalty suffered exile and loss of property. He returned to Tennessee after its occupation by Federal troops and became Attorney-General of the State in 1864. He was again a Representative in Congress from 1866 to 1875, was Minister to Russia from 1875 to 1880, and was Postmaster-General in President Hayes's cabinet from August, 1880, to March, 1881.

MAYNARD, SIR JOHN (1602-90). An English constitutional lawyer. He was born at Tavistock, England, and was educated at Exeter College, Oxford. After the regular course of study in the Middle Temple he was called to the bar in 1626; he had been elected a member of Parliament in the previous year. He was subsequently made a sergeant at law and King's sergeant, but declined the place on the bench offered him by Charles II in 1660. While an advocate for increasing the power of the people, he never concurred in the extreme views taken by the radical Republicans, and, although an earnest Presbyterian, stood aloof from the fanaticism of many in his party. He was active in the prosecution of Strafford and Laud, but opposed the arbitrary power assumed by the army and Cromwell's evident intention of making himself King in fact, if not in name; for the position he took in this respect he was, in 1647, expelled from the House of Commons and imprisoned in the Tower, and in the following year he was fined £500 for refusing to kneel at the bar of the House of Lords. At the Restoration the honor of knighthood was conferred upon him by Charles II. His political course under that monarch was judicious and conservative. In the time of the revolution and the accession of William and Mary he showed ability, notably in the great conference held between the House of Lords and the Commons in regard to the abdication of James II, a measure which he strenuously advocated. In the same year, 1689, he was made Commissioner of the Great Seal. A number of his political speeches and legal decisions have been printed in various collections. His manuscript collections in 87 volumes are preserved in Lincoln's Inn Library. He died at Gunnersbury Manor.

MAYNE, JASPER (1604-72). An English dramatist and divine, educated at Westminster School and at Christ Church, Oxford (B.A., 1628; M.A., 1631). While at the university he wrote considerable occasional verse. To him has been ascribed, on very doubtful grounds, the beautiful eulogy signed I. M. S. prefixed to the second folio of Shakespeare's works (1632). He afterward wrote verses in honor of Ben Jonson and Beaumont and Fletcher. His two plays are the *City Match*, a comedy (printed 1639), and *The Amorous War* (printed 1648), a tragicomedy, containing the quaint lyric beginning "Time is a feathered thing" (reprinted in *The Oxford Book of English Verse*, A. T. Quiller-Couch, Oxford, 1900). In 1638 he began a translation of Lucian's *Dialogues* (printed 1664), afterward completed by Francis Hicks; and for Donne's *Paradoxes* (1652) he translated several Latin epigrams. During the Civil War he lived mostly at Oxford, where he frequently preached before the King. After the Restoration he was appointed a canon of Christ Church and arch-deacon of Chichester. He died at Oxford, Dec. 6, 1672.

MAYNOOTH, mā-nōoth'. A village of Kil-

dare, Ireland, west of Dublin, having a population of less than 1000 (Map: Ireland, E 5). It was the seat of the Geraldines, the ruins of whose castle remain. It was of importance in the rebellions of the Irish in the reign of Henry VIII and in the time of the civil wars and the Commonwealth. It is chiefly known now as the site of the Roman Catholic College of St. Patrick, opened in 1795. There have been 600 students in attendance, about 100 entering each year, all candidates for the priesthood, and more than half supported by funds for that purpose. Consult T. Healy, *Maynooth College: Its Centenary History* (Dublin, 1895).

MAYO, mā'ō. A maritime county of the Province of Connaught, Ireland, bounded north and west by the Atlantic Ocean; east by Sligo and Roscommon, and south by Galway (Map: Ireland, B 4). Area, 2156 square miles. The picturesque coast line is about 250 miles long, with harbors at Westport and Newport. There are many islands off its coasts. The surface is very irregular, with cliffs and mountains in the north and west and a hilly plain in the east. The highest point is Mweelrea (2688 feet). The chief stream is the Moy. The chief industry is cattle raising; fisheries, linen and woolen manufactures are also carried on. The capital is Castlebar. Pop., 1901, 199,166; 1911, 192,177.

MAYO, mā'yō. A tribe upon the river of the same name in Sonora, Mexico. They and the Yaqui (q.v.), their northern neighbors and allies, speak dialects of the same language, commonly called Cahita, and possibly belonging to the Piman linguistic stock. In physical characteristics and habits the two tribes are practically identical. The Mayo cultivate corn, cotton, squashes, beans, tobacco, and maguey, from which last they manufacture mescal. Their houses are light structures of cane and boughs, covered with palm leaves. They are now very much Mexicanized and number perhaps 7000. See PIMAN STOCK.

MAYO, mā'ō, AMORY DWIGHT (1823-1907). An American clergyman and educator. He was born at Warwick, Mass., was educated at Amherst College, and studied theology with the Rev. Hosea Ballou. At first a Universalist, between 1846 and 1872, he was pastor of churches in Gloucester, Mass., Cleveland, and Albany, and later of Unitarian churches in Cincinnati, Ohio, and Springfield, Mass. Afterward he devoted himself largely to educational work in the South, although from 1868 to 1898 he was professor or lectured periodically in the Meadville (Pa.) Theological School. A number of his reports were published by the United States Bureau of Education.

MAYO, CHARLES HORACE (1865-). An American surgeon. He was born at Rochester, Minn., studied at Northwestern University, graduated from the Chicago Medical College in 1888, and thereafter practiced at Rochester, where he became surgeon of St. Mary's Hospital. He served as president of the Minnesota State Medical Society (1905) and of the Western Surgical and Gynecological Society (1904) and also as chairman of the surgical sections of the American Medical Association (1907) and the International Tuberculosis Congress (1908). Charles Mayo became known especially for his success in operations for various forms of goitre. With his brother William J. (q.v.) he published *A Collection of Papers Published Previous to 1909* (2 vols., 1912). Subsequently appeared in

medical journals and later in reprints: *Intra-thoracic Goitre, with Report of Cases* (1910); *The Prophylaxis of Cancer* (1910); *Surgery of the Thymus Gland* (1912).

The father of Charles and William Mayo, WILLIAM WORRALL MAYO (1820-1911), was born near Manchester, England, but came early to the United States. He was educated at the University of Missouri and at the College of Physicians and Surgeons, New York, where he graduated in 1854. He was one of the pioneer surgeons of the Northwest, with his practice established at Rochester, Minn.

MAYO, FRANK (1839-96). An American actor, best known for his long-continued popularity in the backwoods character of Davy Crockett. He was born in Boston. Early in life he went to San Francisco, where at 17 he began his career and within a few years was appearing with the young Edwin Booth. In 1863 he became a leading man in San Francisco and in 1865 in Boston. He won applause as Othello, Hamlet, Ferdinand in *The Tempest*, and in other classic rôles, but greater success with the public as Badger in *The Streets of New York*, till in 1872 he brought out *Davy Crockett*. Among his later productions were his own dramatizations of *Nordeck* and of Mark Twain's *Pudd'nhead Wilson*, the latter a character well suited to display his peculiar gifts as a comedian.

MAYO, HENRY THOMAS: (1856-). An American naval officer, born at Burlington, Vt. He graduated from the United States Naval Academy as a midshipman in 1876 and was promoted to ensign, 1878; lieutenant (junior grade), 1885; lieutenant, 1890; lieutenant commander, 1899; commander, 1905; captain, 1908; rear admiral, 1913. During the early part of his career he served on the *Kearsarge* (original), *Monocacy*, and *Tennessee* on the Asiatic Station; in the Coast Survey; on the *Jamestown*, *Bennington*, and *Thetis* on the Pacific coast; on the *Bennington* (navigator) during the Spanish-American War; and as executive officer of the *Wisconsin* in 1901-04. In 1907-08 he commanded the cruiser *Albany* and in 1909-11 the armored cruiser *California*. He was Lighthouse Inspector of the Twelfth District (1905-07); Secretary of the Lighthouse Board (1908-09); and commandant of the navy yard, Mare Island (1911-13). In 1913 he became aid for *personnel* to the Secretary of the Navy. Shortly after his promotion to rear admiral he was ordered to command a division of the North Atlantic fleet and in 1915 was still serving in that capacity. While senior officer of the force off Tampico, Mexico, in April, 1914, a boat's crew of the *Dolphin*, one of the vessels under his command, was seized by Mexican soldiers. (See MEXICO, *History*; UNITED STATES, *History*.) Admiral Mayo's prompt and decisive action at this time won him official praise and general approval. He was the first, under a new law, to be made vice admiral (1915).

MAYO, JOHN. See MAYOW, JOHN.

MAYO, RICHARD SOUTHWELL BOURKE, sixth EARL OF (1822-72). An English statesman. He was born in Dublin, Ireland, was educated at Trinity College there, afterward traveled in Russia, and published an account of his trip, entitled *In St. Petersburg and Moscow* (2 vols., 1846). From 1847 to 1869 he was a member of Parliament and from 1852 to 1869 was Chief Secretary for Ireland. In January, 1869, by Disraeli's appointment, he became Governor-

General of India, in which capacity he introduced extensive and careful reforms in the conduct of the public service and was an efficient and successful administrator. While inspecting the penal settlement at Port Blair, Andaman Islands, he was killed by one of the convicts. Consult Sir W. W. Hunter, *Life of the Earl of Mayo* (London, 1875), and *The Earl of Mayo*, in the "Rulers of India Series" (Oxford, 1892).

MAYO, WILLIAM JAMES (1861-). An American surgeon. Born at Le Sueur, Minn., he graduated M.D. from the University of Michigan in 1883, became a practicing surgeon at Rochester, Minn., and served with his brother, Charles Horace Mayo (q.v.), as surgeon of the Mayo clinic of St. Mary's Hospital. He became first lieutenant in the United States Medical Reserve Corps and regent of the University of Minnesota. He was president of the Minnesota State Medical Society in 1895, of the American Medical Association in 1906 (chairman of the surgical section in 1899), and of the American Surgical Association in 1913-14. William Mayo became known as an especially successful operator in cases of gallstones, cancer, and diseases of the intestinal tract. His papers up to 1909 appeared in the collection mentioned in the article on his brother Charles. Later ones, important in medical literature, include: *Gastrojejunostomy* (1911); *Removal of the Rectum for Cancer: Statistical Report of 120 Cases* (1911); *Jejunostomy* (1912); *Surgery of the Spleen* (1913).

The world-wide fame of the Mayo brothers as operators rests not only on their skill, but also upon the development of their clinic, where they surrounded themselves by a staff of physicians and nurses recognized as leaders, each in his specialty. The clinic is annually visited by about 3000 physicians, many of whom take post-graduate courses. In 1914 more than 10,000 operations were performed. Every detail is studiously considered, and the careful notes taken appear yearly in *Collected Papers by the Staff of St. Mary's Hospital, Mayo Clinic, Rochester, Minnesota* (Philadelphia, 1910 et seq.). Consult G. W. Broome, *Rochester and the Mayo Clinic* (New York, 1914).

MAYO, WILLIAM STARBUCK (1812-95). An American novelist and traveler. He graduated from the New York College of Physicians and Surgeons (1833), traveled widely in little-explored regions, and first won notice in fiction by *Kaloolah* (1849), a romance of Central Africa. This was followed by *The Berber*, a story of the mountaineers of the Atlas (1850, 1883); *Romance Dust from an Historic Placer*, a collection of short stories (1851); *Never Again* (1873). Mayo's novels are strong in narration, good in plot, weak in character.

MAYÓN, mà-yón', or ALBAY. An active volcano and the highest peak in Luzon, Philippine Islands. It is situated in the Province of Albay, near the southeast extremity of the island (Map: Philippine Islands, D 4). It is a majestic cone, rising from the seashore to a height of 7916 feet, and capped by a white cloud of smoke which in the night assumes a fiery glow. Its sides are covered with grass and moss, and though apparently smooth and unobstructed, the mountain is very difficult of ascent. There have been a number of eruptions during the past century, in which the mountain emitted great quantities of lava, cinders, and incandescent rocks. The eruption of 1814 destroyed the old town of

Cagsaua, with a loss of 1200 lives; and the last great eruption in 1897 emitted volumes of lava and ashes, the latter covering an area 75 miles in radius.

MAYOR, mā'ēr (from Lat. *major*, greater, comparative of *magnus*, great). The chief executive officer of a municipal corporation. In England the mayor was originally a steward, bailiff, or overseer. Later he became the chief magistrate of a corporate town. During the reign of John the right of formally choosing their mayor was conceded to the barons of London, the election being subject to the approval of the King. During the same reign the other large towns were allowed to have mayors. The mayors of the cities of York, Dublin, and London bear the title of Lord Mayor. The Lord Mayor of London, whose jurisdiction extends only to the ancient inner city, is chosen annually from among the aldermen, practically by the liverymen of the guilds. His chief duty is to sustain the hospitality of the city, for which purpose he receives an allowance of £8000 a year, together with the use of the mansion house. The ordinary English mayor is elected by the municipal council, usually from among the aldermen, for a term of one year. He is an *ex officio* justice of the peace and usually serves as a returning officer. In France there is a mayor (*maire*) at the head of each commune, elected by the municipal council from among its own members. He serves during the term of the council. In the Germanic countries the mayor or burgomaster is usually a highly trained professional officer with more or less experience in the municipal service, and is frequently called to the headship of a larger municipality after having gained a reputation as mayor of a smaller town. He is elected by the city council for a long term, often for life. The prevailing method of selecting mayors in the larger countries of Europe is election by the municipal council. In Belgium, Denmark, Holland, Norway and Sweden, and in Italy, so far as the larger towns are concerned, the method of appointment is by the central government.

In the United States the office of mayor existed from the earliest Colonial times, being taken over as a part of the English municipal system. At first the mayor was usually appointed by the Governor, and was generally a member of the municipal council. Later he was excluded from the council and then came to be chosen by the council, although occasionally, as in the city of Boston, he was elected by popular vote from the beginning. This is now the rule in the United States almost without exception. The term of the mayor in the United States varies from one year to five, the usual term being two years. Everywhere in Europe the mayor acts as the local agent of the central government and consequently is often subject to disciplinary control by the central government. Thus, the French mayor may be suspended by the prefect for one month, by the Minister of the Interior for three months, and may be permanently removed by the President; a somewhat similar rule prevails in other continental states. In several American States the mayor may be removed by the Governor for cause, subject to the power of the courts to determine what shall constitute just cause in a given case. Besides his duty as agent of the central government the mayor is the official head of the municipal corporation. His powers are much larger in some

countries than in others. In the United States there is a marked tendency of late years towards increasing the power of this officer and making him chiefly responsible for the good government of the city. See sections *Local Government* in the various countries mentioned. Consult G. J. Bayles, *Office of Mayor in the United States: A Study in Administrative Law* (New York, 1895). See MUNICIPALITY.

MAYOR, JOHN EYTON BICKERSTETH (1825–1910). An English classical philologist, brother of J. B. Mayor, born at Baddagama, Ceylon. He graduated from St. John's College, Cambridge (1848), and was appointed fellow in 1849; from 1849 to 1853 he was assistant master at Marlborough College. In 1853 he became lecturer at St. John's College, Cambridge. Of this university he was librarian from 1863 to 1867, and in 1872 he was made professor of Latin there. He became president of his college in 1902. Mayor became best known as editor of *Thirteen Satires of Juvenal* (2 vols., 1853; 3d ed., 1881); the chief feature of this work is its array of illustrative quotations. He also edited some of Cicero's works, especially the *Second Philippic*, Homer's *Odyssey*, books ix–xii, Pliny's *Letters*, book iii, and was the author of many other works relating to the classics, the history of education, and the Church. For a time he was one of the editors of the *Journal of Philology*. For a notice of his career, by J. E. Sandys, consult *The Classical Review*, vol. xxv (London, 1911).

MAYOR, JOSEPH BICKERSTETH (1828–). An English classical scholar, brother of J. E. B. Mayor. He was educated at Rugby and at St. John's College, Cambridge, where he graduated B.A. in 1851. After some years as fellow and lecturer he was ordained a priest in the Established church. From 1863 to 1868 he was head master of Kensington Proprietary School and in 1870 became professor of classics in King's College, London. This post he resigned in 1879. Mayor had married in 1863 a niece of the historian George Grote, and became his literary executor, editing his posthumous essays on philosophy. His other works include an edition of Cicero, *De Natura Deorum* (3 vols., 1880–85); a valuable bibliography entitled *A Guide to the Choice of Classical Books* (four editions, 1880–96); *Ancient Philosophy*, a convenient sketch (1881); *Chapters on English Metre* (1886; 2d ed., 1901); *Handbook of Modern English Metre* (1903); *The World's Desire, and Other Sermons* (1906); *Select Readings from the Psalms, with an Essay on the Growth of Revelation* (1908). He also published editions, with introduction, notes, etc., of: *The Epistle of St. James* (3d ed., 1910; with additions, 1913); Clement of Alexandria's *Stromateis*, book vii, based on Hort's notes (1902); *The Epistle of St. Jude and Second Epistle of St. Peter* (1907). From 1887 to 1893 Mayor edited the *Classical Review*.

MAYORGA, mā-yōr'gā, MARTÍN DE (c.1715–83). A viceroy of Mexico. After having been dubbed a knight of Alcántara and appointed field marshal of the royal army, captain of the Spanish Royal Guards and Governor of Alcántara in Estremadura, he was in 1773 appointed Governor of Central America. In 1779, on the death of Bucareli, he was made forty-seventh Viceroy of New Spain. While he was in power there broke out an epidemic of smallpox, to arrest which he made great exertions. He founded an academy of arts in Mexico, and sent to the royal archives of Spain for publication

copies of the manuscripts of the historian Veytia. His attitude towards foreign encroachment was vigorously defensive.

MAYOR (mā'ēr) OF THE PALACE. See MAJOR DOMUS.

MAYORUNÁ, mā'yō-rōō'ná. A fierce and savage tribe of Panoan stock (q.v.) living south of the Marañon (Amazon), between the Ucayali and Javari rivers, northeastern Peru. They are supposed to have lived formerly farther to the west and to have been driven into the forest by the Inca conquest. From the frequency of beards and light skins among them, traditionally due to admixture of Spanish captive blood, they are sometimes called *Barbados* (bearded) by the Spaniards. They live by hunting and keep to the forests, seldom coming down to the rivers, being at war both with all the other tribes and with the whites. Their weapons are spears, clubs, and blowpipes, and they are famous for their powerful blowgun poison. They are tall and well formed, go perfectly naked, and cut their hair across the forehead, letting it fall loosely down behind.

MAYO-SMITH, RICHMOND (1854–1901). An American economist and educator, born at Troy, Ohio. He was a brother of Henry Preserved Smith (q.v.), Mayo being his mother's maiden name. He graduated at Amherst in 1875 and then studied for two years at Berlin and Heidelberg. Between 1877 and 1883 he was assistant and adjunct professor of history and political science at Columbia University; afterward he held the chair of political economy and social science. In his researches he devoted himself especially to statistics, a field in which he became an authority. He was an editor of the *Political Science Quarterly*, vice president of the American Statistical Association (1897 to his death), and one of the founders of the American Economic Association. His publications include: *Emigration and Immigration* (1890); *Sociology and Statistics* (1895); *Statistics and Economics* (1899).

MAYOTTE, mā-yōt'. One of the Comoro Islands (q.v.).

MAYOW, mā'ō, JOHN (1643–79). An English chemist and physiologist, born in London. He studied law and medicine at Oxford and practiced medicine at Bath, but devoted himself specially to research in chemistry and physiology and is chiefly known for his ingenious speculations concerning the process of combustion, in which he anticipated, to some extent, the ideas which have since been induced from the discoveries of Priestley, Lavoisier, and others. His principal publication was *Tractatus quinque Medico-Physici* (1674). It appeared under the title *Opera Omnia Medica Physica* in 1681, and was translated into Dutch (1684), German (1799), French (1840), and English (1907). His work in anatomy and physiology, especially on the subject of muscular action and on respiration, was also important.

MAY'POP. The fruit of a passion flower (q.v.).

MAYR, mīr, GEORG VON (1841–). A German economist, born in Würzburg. He studied at Munich, where he became professor in 1868; was appointed in 1879 Undersecretary to the ministry for Alsace-Lorraine; retired in 1887, and became docent (1891) and professor (1895) in the University of Strassburg. In 1898 he was called to Munich. He was rector of this university in 1913–14. He founded the

Zeitschrift des bayrischen statistischen Bureaus (1869) and *Das allgemeine statistische Archiv* (1890) and wrote: *Die Gesetzmässigkeit im Gesellschaftsleben* (1877); *Zur Reichsfinanz-Reform* (1893); *Statistik und Gesellschaftslehre* (1895-97); *Die Pflicht im Wirtschaftsleben* (1900); *Flotte und Finanzen* (1900); *Grundriss zu Vorlesungen über praktische National-ökonomie* (1900 et seq.); *Zolltariffentwurf und Wissenschaft* (1901); *Die Bevölkerung Britisch-Indiens* (1907).

MAYR, or MAYER, JOHANN SIMON (1763-1845). A German-Italian dramatic composer, born at Mendorf, Bavaria. His father was a musician, and the boy studied under him and at a Jesuit seminary at Ingolstadt, and later under Lenzi at Bergamo, Italy, where he settled permanently. In 1791 an oratorio, *Jacob a Labano Fugiens*, was so successful that he was commissioned to write three more, and in 1794 he produced his first opera, *Saffo, ossia i riti d'Apollo Leucadio*. During the next 20 years he wrote about 70 operas, which were only surpassed in popular favor by those of Rossini. In 1802 he became chapelmaster at Santa Maria Maggiore in Bergamo, and while there refused the offers of posts at London, Paris, Dresden, and Milan. He was also professor of composition in the music school of Bergamo, and Donizetti was one of his pupils. His best operas were: *Lodoïska* (1795), *Ginevra di Scozia* (1801), *Media* (1812), and *Rosa bianca e Rosa rossa* (1814). He was blind for a number of years before his death, which occurred at Bergamo. In 1852 a monument was erected to his memory in that city. Consult H. Kretzschmar, *Die musikgeschichtliche Bedeutung Simon Mayrs* (Leipzig, 1904).

MAY SUCKER. A fish. See CUTLIPS.

MAYSVILLE. A city and the county seat of Mason Co., Ky., 63 miles southeast of Cincinnati, Ohio, on the Ohio River, and on the Chesapeake and Ohio and the Louisville and Nashville railroads (Map: Kentucky, G 2). It has the Maysville and Mason County Public Library, incorporated in 1878, a fine Federal building, County Historical Association, Wilson Memorial Hospital, and Beechwood Park. There are important commercial interests, the city being the centre of a rich agricultural country, and its industries are represented by cotton mills, ice factories, flour, saw, and planing mills, foundries, distilleries, cigar, chewing-tobacco, furniture, and shoe factories, pressed-brick plants, and plow and pulley works. Settled as early as 1784, Maysville was incorporated as a town by the Virginia Legislature in 1787, and was chartered as a city in 1833, becoming a fourth-class city 60 years later. In 1848 it was made the county seat. Pop., 1900, 6423; 1910, 6141.

MAYUMO, SAN MIGUEL DE. See SAN MIGUEL DE MAYUMO.

MAYUR PANDIT. See MARATHI.

MAY'WEED (older Eng. *maieweed*, variant of *maytheweed*; influenced by popular etymology with *May*, the fifth month), *DOG FENNEL* (*Anthemis cotula*). A plant of the family Compositae, growing in pastures and meadows. It is a native of Europe, but, although widely spread in America, it is not an aggressive weed.

MAY'WOOD. A village in Cook Co., Ill., on the Des Plaines River, 11 miles by rail west of Chicago, on the Chicago Great Western, the Chicago and North-Western, and the Indiana

Harbor Belt railroads (Map: Illinois, J 2). The most important industries of the village are the manufacture of tin plate and cans and lithographing. Maywood contains the Logan Home, the Baptist Old People's Home, the German Lutheran Theological Seminary, the Chicago Theological Seminary, Kittle Smith Home for Crippled Children, and Library Hall. The water works are owned by the municipality. Pop., 1900, 4532; 1910, 8033; 1914 (U. S. est.), 9783; 1920, 12,072.

MAZADE, mǎ'zǎd', CHARLES DE (1820-93). A French publicist, born at Castel-Sarrasin (Tarn-et-Garonne). He studied law at Toulouse and afterward became a contributor to the French press. He became one of the contributors to the *Revue des Deux Mondes* (1846), and from 1852 to 1858 and again from 1865 until his death directed its department of politics. His publications include: *L'Espagne contemporaine* (1855); *L'Italie moderne* (1860); *La Pologne contemporaine* (1863); *L'Italie et les Italiens* (1864); *Lamartine, sa vie littéraire et politique* (1872); *La guerre de France* (1875); *Le comte de Cavour* (1877); *M. Thiers: cinquante années l'histoire contemporaine* (1884); *Un chancelier l'ancien régime: le règne diplomatique de M. de Metternich* (1889); *L'Europe et les neutralités* (1893); *L'Opposition royaliste: Berryer, De Villèle, De Falloux* (1894); and he edited the *Correspondance du maréchal Davout* (1885).

MAZAGAN, mǎ'zǎ-gǎn'. A seaport of Morocco, Africa, situated on the Atlantic coast, about 110 miles north of the city of Morocco, of which it is the port (Map: Africa, D 1). It is strongly fortified and is the centre of a brisk trade in agricultural products, fruit, and wool. The imports in 1912 amounted to \$2,600,000 and the exports to \$2,400,000, but 80 per cent of the trade is with France and Great Britain, the chief exports being wool, hides, corn, beans, and wax. The settlement was founded by the Portuguese in 1509, and numerous old houses of European design still remain. They abandoned the city in 1769 to found a new colony in Brazil. The population is estimated at 14,000, including a number of European merchants and consular agents, and the Jewish inhabitants constitute a quarter of the population.

MAZAMET, mǎ'zǎ'mǎ'. A town in the Department of Tarn, France, situated on the north slope of the Black Mountains about 50 miles east-southeast of Toulouse (Map: France, S., G 5). It is noted for its extensive manufactures of cloth, flannel, clothing, hosiery, and leather. Pop. (commune), 1901, 13,978; 1911, 14,764.

MAZANDERAN, mǎ'zǎn-de-rǎn'. A province of northern Persia, south of the Caspian Sea, bounded respectively east, south, and west by Astrabad, Irak-Ajemi, and the Elburz Mountains and Gilan (Map: Asia, Central, D 4). It is about 200 miles long by 50 miles broad, with an estimated area of 10,000 square miles. The surface is low and swampy near the Caspian Sea, covered partly with jungle. This part is watered by numerous small streams and is malarial. The land rises towards the south and culminates in Demavend (19,400 feet). The chief minerals are iron ore and petroleum and its by-products. The ground in many parts is swampy, but fertile, and rice, cotton, sugar cane, fruit trees, and the mulberry for the silk industry are largely cultivated. Fishing is an important industry, as also is grazing, horses, cattle, sheep,

and goats being raised in great numbers. There is a considerable export trade with Russia of silk and agricultural products, the imports being cotton and woolen goods, cutlery, and tobacco. Pop. (est.), 200,000. Capital, Sari.

MAZANDERANI, mǎ'zân-de-rǎ'ně. The natives of Mazanderan, or Taberistan, in northern Persia, on the Caspian Sea. They speak a dialect of Persian which, like the speech of the neighboring Province of Ghilan, has peculiarities justifying its classification as a special form of the Persian tongue. The Mazanderani are of smaller stature than the people of the highlands, well proportioned, with regular features, bushy eyebrows, and abundant hair.

MAZARA. See MAZZARA DEL VALLO.

MAZARIN, mǎ'zâ'rân', JULES (1602-61). A Cardinal and Prime Minister of France during the minority of Louis XIV. He was born July 14, 1602, at Piscina in the Abruzzi, Italy, his father being intendant of the household of Philip Colonna. He was educated in the Jesuit College at Rome, and later accompanied Jerome Colonna to the Spanish University of Alcalá, where he studied law, but also indulged in gambling and love-making—practices which were continued at Salamanca. On returning to Rome Mazarin became a doctor of canon and civil law and entered the Pope's military service as a captain of infantry in the Colonna regiment. His talents, however, were more diplomatic than military, and after being employed on several political missions in Italy he accompanied the Papal Legate to the court of France and there, about 1628, became known to Richelieu, who perceived his peculiar talents and engaged him to maintain the French interests in Italy. This he did while still employed by the Pope as Vice Legate to Avignon (1632) and Nuncio to the French court, an office to which he was appointed in 1634. The Spaniards complained of his partiality for France, and the Pope was obliged to recall him. In 1639, however, he openly entered the service of Louis XIII, was naturalized a Frenchman, and in 1641 received a cardinal's hat, through the influence of Richelieu, who, when dying, recommended Mazarin to the King as the only person capable of carrying on his political system. Mazarin's position was one of great difficulty amid the intrigues, jealousies, and strifes of the earlier years of Louis XIV's minority. The Queen mother, Anne of Austria, was at first hostile to him, but although she was declared sole Regent and guardian of the young King, Mazarin kept his place as Minister, and soon made himself indispensable to her by his wonderful business qualities, while the exquisite charm of his manner eventually gained her heart. It is said, in fact, that a secret marriage took place between the Queen Regent and her Prime Minister, but this has never been absolutely proved. The result of the close alliance between the Queen and himself was that Mazarin ruled with almost as unlimited sway as Richelieu had done. The Parlement of Paris, thinking to conquer political power, resisted the registration of edicts of taxation; but Mazarin caused the leaders of the opposition to be arrested; whereupon began the disturbances of the Fronde (q.v.). Twice compelled to retire from court, he made a triumphant entry into the capital in 1653 and in a short time had regained his former power.

In the internal government of the country those principles of despotism were established

on which Louis XIV afterward acted. Mazarin continued Richelieu's foreign policy, waging war vigorously against the Hapsburg power in Austria and Spain; his most important diplomatic acts were in connection with the Peace of Westphalia in 1648 and that of the Pyrenees in 1659. The administration of justice in France under Mazarin became very corrupt, and the commerce and finances of the country underwent a great depression. As a financier, Mazarin was far inferior to Richelieu. He was avaricious and enriched himself at the expense of the country. He died at Vincennes, March 9, 1661. His magnificent library he bequeathed to the Collège Mazarin at Paris.

Bibliography. The best idea of Mazarin is obtained from his correspondence, published by Chéruel, "Lettres du cardinal Mazarin pendant son ministère," in the *Collection de documents inédits sur l'histoire de France*, first series (Paris, 1872-94). Consult also: C. Moreau, *Bibliographie des Mazarinades* (ib., 1850); Cousin, *Jeunesse de Mazarin* (Paris); Chéruel, *Histoire de France sous le ministère de Mazarin, 1651-1661* (ib., 1882); Arthur Hassall, *Mazarin* (ib., 1903); J. B. Perkins, *France under Mazarin* (2 vols., New York, 1915).

MAZAR-I-SHERIF, mǎ-zār'-ê-she-réf'. The capital, a fortified town of Afghan Turkestan, situated about 9 miles east of Balkh (Map: Afghanistan, M 4). Its mosque (1420) is said to be the tomb of Ali, the son-in-law of Mahomet. It manufactures swords and other weapons. In the vicinity are mineral springs. Pop. (est.), 25,000.

MAZARRÓN, mǎ'thār-rôn'. A town of south-east Spain, in the Province of Murcia, situated 2½ miles from the Mediterranean coast, 16 miles west of Cartagena (Map: Spain, E 4). In the neighboring mountains are mines of iron and argentiferous lead, which date from the times of the Phenicians and Romans; and the town contains several metallurgical establishments, besides soap factories and flour mills. A railroad 5 miles long connects it with its port in the small Bay of Mazarrón, where there is a good roadstead and a lighthouse. At this port is located one of the largest and best lead-smelting establishments of Spain, capable of producing 125 tons of lead daily. There is also considerable trade in lead and ores, machinery, coal, and timber. Pop., 1900, 23,362; 1910, 22,660.

MAZAS, mǎ'zâ', PRISON OF. A prison in Paris in which the first trial of solitary confinement was made in France. It was built between 1845 and 1850 to replace the prison of La Force on the Boulevard Mazas (now the Boulevard Diderot), and was officially known as *Maison d'arrêt cellulaire*. The building was demolished in 1900.

MAZATEC, mǎ'zâ-ték'. A tribe occupying the districts of Teotitlan and Tuxtepec in Oaxaca, Mexico. They are agricultural and are noted silk raisers, weaving gorgeous fabrics of that material, and having many curious beliefs and taboos in connection with the tending of the silkworms. In language the Mazatec are connected with the adjoining Chocho, Popoloco, Trique, and Ixcatec and the five together form the Mazatecan stock. This was formerly believed to be connected with Mixtec, but is probably distinct.

MAZATLAN, mǎ'sâ-tlân'. A seaport in the State of Sinaloa, Mexico, situated at the entrance of the Gulf of California (Map: Mexico, F 6).

It is a well-built and picturesque town and has a handsome city hall, a nautical school, and two hospitals. A street railroad runs through the town, which is lighted by gas. The harbor is an open roadstead, but is regularly visited by several lines of steamers. It is on the main line of the Southern Pacific Railroad of Mexico and is an important distributing centre for the trade of the interior. The chief exports are silver, pearls, copper, lead, dyewoods, and skins. Pop., 1900, 17,852; 1910, 21,219. The bubonic plague appeared here in 1903 and caused many deaths. The city suffered a long siege and was captured by the Constitutionalists during the revolution in 1914. In 1912 its exports amounted to \$4,263,480 and imports \$2,531,800. It is the seat of a United States consul.

MAZDAK, mǎz'dák (470-?). A Persian reformer, who founded a religious and social sect that existed for a time and were known as Mazdakites, after his name. He was born at Persepolis and belonged originally to the Magian faith, being a priest at Nishapur. He became imbued with communistic and reformatory views and preached the doctrine not alone of the equality of mankind but of the community of property, including women, and the consequent abolition of marriage laws. Simplicity in manner of life and dress, and abstinence from animal food, except milk and eggs, were enjoined. He succeeded in converting to his faith King Kavadh, or Kobad (488-531 A.D.); but a revolution of the nobles, urged on doubtless also by the jealous Magian clergy, resulted in dethroning the King and placing Jamasp, his brother, on the throne (497 A.D.). Three years later Kobad was restored to power, and for political purposes he outwardly recanted his Mazdakite views. Towards the end of his reign, suspecting state intrigues by the Mazdakites, he allowed Mazdak and thousands of his followers to be put to death (528-29 A.D.). Traces of the sect lingered on in the neighborhood of Hamadan as late as the Seljukid era. Consult E. G. Browne, *Literary History of Persia* (London, 1909).

MAZE. See LABYRINTH.

MAZE, mǎz, HIPPOLYTE (1839-91). A French historian and politician, born at Arras. He entered the Ecole Normale Supérieure in 1859, became a fellow in history in 1863, and taught at the lycées of Cahors, Saint-Quentin, Angers, and Versailles. He was appointed a prefect of Landes in 1870. The next year, however, he returned to teaching and became first professor of history at the Lycée Fontanes in Paris. He was elected to the Chamber of Deputies in 1879 as a Republican and reelected in 1881. From 1886 until his death he was Senator from Seine-et-Oise. A monument to him was erected in Viroflay in 1894. Among his publications are: *La république des Etats-Unis d'Amérique: sa fondation* (1869); *La fin de la révolution par la république* (1872); *Hoche en Vendée* (1882); *La lutte contre la misère* (1883); *Général Marceau* (1889).

MAZELLE, má-zél', EDUARD (1862-). An Austrian meteorologist. He was educated at Graz and in 1883 became an assistant and in 1903 director of the Maritime Observatory at Trieste. He made important researches on atmospheric electricity and demonstrated that evaporation of sea water is slower than that of fresh water. He published a textbook of meteorology and oceanography for use in nautical schools.

MAZEPPA, IVAN STEFANOVITCH (c.1640-1709). A leader of the Cossacks, born in the Russian Province of Kiev, of a noble family. After receiving a good education, he became a page in the service of John Casimir, King of Poland. There is a good tradition that a Polish nobleman who had surprised him in an intrigue with his wife, bound him naked on his own horse and lashed the animal out into the steppes. The horse carried him to his own distant residence—not to the Ukraine, as has been often said; but Mazeppa, out of shame, fled to the Ukraine, joined the Cossacks, rose to high distinction among them, overthrew their hetman, Samilovitch, and in 1687 was elected in his place. He won the confidence of Peter the Great, who used him in the Volhyna campaign of 1705-06 and loaded him with honors never before bestowed on any Cossack hetman, finally making him Prince of the Ukraine. But on the curtailment of the freedom of the Cossacks by Russia, Mazeppa, who never really liked the Czar's new ways as well as his own, hoping to achieve complete independence, entered into negotiations with Charles XII of Sweden, joined him with a considerable band (some 80,000 Cossacks), and took part in the battle of Poltava in 1709. When Mazeppa's treachery and insubordination were discovered his stronghold in the Ukraine was razed by Peter's orders. His sudden discomfiture cost him nearly all his power and prestige with his former following among the Cossacks. Moreover, he was excommunicated by the Metropolitan of Kiev. Mazeppa, with what few followers he could still muster, followed King Charles to Turkey. Despite Peter's offer of 300,000 ducats to the Sultan to have Mazeppa extradited, the latter was not turned over to Russia. He died in Bender in 1709. His story has been widely treated in painting, poetry, the novel, the drama (notably by Byron in his poem *Mazeppa*), and in music (notably by Liszt in a symphonic poem by that name).

MAZOIS, má'zwá', FRANÇOIS (1783-1826). A French architect, born at Lorient. A pupil of the Ecole Polytechnique and of Percier (q.v.), he was employed (about 1808) by King Murat of Naples on his Portici palace, and later was pensioned and commissioned by Queen Caroline to study and report upon the ruins of Pompeii. The resulting work in four folio volumes, *Les ruines de Pompéii*, an epoch-making publication (1812), was followed by *Le palais de Scourus, ou description d'une maison romaine* (1822) and other works. In 1820 he was appointed inspecteur général du conseil des bâtiments civils in Paris.

MAŽURANIĆ, mā'zhōō-rā'něch, IVAN (1814-90). A Croatian poet and statesman, born in Novi Sad (Neusatz). He studied at Fiume and Agram and practiced law for several years. He took an active part in promoting the national spirit of the Croats and wrote the influential manifesto *Hrvati Magjarom* (The Croats to the Magyars) (1848). He was made procurator general of Croatia and Slavonia in 1850. Afterward he became first chancellor of Croatia and Slavonia (1861) and from 1873 to 1880 was Ban, or governor, of Croatia. Mažuranić is one of the most representative as well as the greatest of Croatian poets. His poems first appeared in the *Danica Ilirska* (Star of Illyria) in 1835. His masterpiece is the epic poem on the death of the oppressive Ismail Čengić Aga, *Smrt Ismail Age Čengića* (1846). This fine poem has been

translated into French by Courrière (in the *Revue Britannique*, 1878) and into German by Kienberger (1874). Mažuranić also wrote (1844) two cantos in the manner of Gundulić (q.v.) to supply those missing in that poet's *Osman*.—His brother, ANTON MAŽURANIĆ (1850–88) was a distinguished philologist.

MAZURKA, mǎ-zoor'kǎ (Pol., Mazur dance, so named from the Mazurs, a branch of the Polish nation inhabiting Masovia in Russian Poland and a district in East Prussia). A national Polish dance in triple time and moderate tempo. Its principal rhythm is . Frequently the musical phrase ends with the second beat, so that the third becomes an up beat to the next bar. The history of the mazurka goes back to the sixteenth century, when it was a song accompanied by a dance. Augustus III (1733–63) introduced it into Germany, and from that country it spread to France and, about 1845, to England. The Russian mazurka differs from its original prototype in that it may be danced by any number of people, while the Polish mazurka is generally performed by either four or eight couples. The steps and even the figures are frequently varied. Chopin revolutionized the mazurka. He extended its form and introduced characteristic Polish melodies, leaving practically only the national character.

MAZZARA DEL VALLO, mǎt-sǎ'rǎ dël vǎll'lo. An episcopal city in the Province of Trapani, Sicily, 32 miles south of Trapani, where the Mazzara flows into the Mediterranean (Map: Italy, D 6). A massive wall 36 feet high encircles the city, which has many interesting ruins. Its cathedral and castle, dating from the eleventh century, and the archiepiscopal palace are the most attractive buildings. The inhabitants of the neighboring region are engaged in agriculture, and an important trade is carried on in barley, corn, olive oil, fruit, cotton, and wine. There are quarries near by. Mazzara del Vallo, the ancient Mazara, was settled by colonists from Selinus, and figured prominently in the early history of the island. Pop. (commune), 1901, 20,130; 1911, 24,865.

MAZZARINO, mǎt'sǎ-rē'nō. A town in the Province of Caltanissetta, Sicily, 35 miles east of Girgenti (Map: Italy, E 6). It has an old castle and sulphur springs in the vicinity. Its products consist of fruit, vegetables, and wine. Pop. (commune), 1901, 16,355; 1911, 15,920.

MAZZEI, mǎt-sǎ'ē, PHILIP (1730–1816). An Italian physician, author, and traveler, a native of Tuscany. After having studied medicine he practiced for several years in Smyrna and was engaged in business in London for more than 15 years. In December, 1773, he went to Virginia for the purpose of introducing grape and olive culture in that colony. There he became acquainted with Thomas Jefferson, and later, after his return to Italy, corresponded with him. From 1779 to 1783 he was the official agent of Virginia in Italy for the purchase of arms, ammunition, and supplies, and in 1785 he revisited America. The correspondence between him and Jefferson was renewed after this second visit, and in April, 1796, Jefferson wrote to him the famous "Mazzei letter." In it he bitterly attacked the Federalist leaders (including, by implication, Washington) for their "monarchistic" tendencies, and declared that democracy was being betrayed by "men who were Samsons in the field and Solomons in the council, but who

have had their heads shorn by this harlot, England." The letter was translated into Italian and published in an Italian paper, translated into French and published in the *Moniteur* at Paris, where it was seen by an American by whom it was translated into English, and sent to the United States, where it appeared in print in May, 1797, soon after Jefferson's inauguration as Vice President. Its publication raised a furor among the Federalists, who, in their feeling against Jefferson, even suggested his impeachment. Mazzei subsequently became a privy counselor to the King of Poland; and later in life was pensioned by the Czar of Russia. He wrote *Recherches historiques et politiques sur les Etats-Unis de l'Amérique septentrionale* (4 vols., 1788).

MAZZINI, mǎt-sē'nē, GIUSEPPE (1805–72). An Italian patriot prominently connected with the struggle for Italian unity and the republican movement throughout Europe. He was born in Genoa, June 22, 1805, studied at the University of Genoa, and practiced law in his native city. In 1827 his first essay in literature, "Dell' amor patrio di Dante," appeared in the Liberal journal *Il Subalpino*, and he subsequently contributed critical, literary, and political papers to the *Antologia* of Florence and other papers. Soon after his departure from the university Mazzini threw himself with fervor into the democratic movement and in 1828 founded the *Indicatore Genovese*, which was, however, soon suppressed. In its pages originally appeared the essay subsequently republished under the title of *Scritti d'un Italiano vivente*. In 1830 Mazzini joined the Carbonari (q.v.) and at once became an active and influential member. He was soon arrested, detained for six months in the fortress of Savona, and finally liberated on condition of his departure from Italy. After short residences in several places he made his home in Marseilles, and thence addressed to Charles Albert of Sardinia the famous letter which caused him to be condemned to perpetual banishment. Having become convinced that the Carbonari was not efficient for the work of Italian regeneration, Mazzini now undertook the organization of a new Liberal league, Young Italy (1831). This organization sought to secure the overthrow of all existing Italian governments and the union of the peninsula under a republican government. In addition to its paramount aim, the general principles of this association enforced the obligation to labor for a common moral regeneration and the establishment of political equality over the world. Liberty, equality, and humanity were the watchwords of the body; education and insurrection the great agencies of its operations; assassination was erased from its statutes, and the symbolic dagger of the Carbonari was replaced by the more humane emblems of a book and the cypress. The white, red, and green tricolor flag of the society became that of the new Italian nation. Mazzini was the animating spirit of this league, which was the parent of similar associations adapted to the individual requirement of the various European nationalities. In 1834 Mazzini planned an armed invasion of Savoy from Switzerland and on February 1 an attack was made on some customhouse officials at the frontier of Savoy, but the undertaking failed utterly. In 1837 Mazzini quitted Switzerland for England and took up his residence in London. There he maintained incessant activity

in literary propaganda and was in touch with political agitators of many countries. He wrote for various periodicals, on literary subjects, communism, education, music, etc. After the February revolution of 1848 Mazzini went to Milan, where he was a resolute opponent of the proposed annexation of the smaller Italian states to Sardinia. He retired to Switzerland on the capitulation of Milan to the Austrians, only to reappear in Florence on the rising in Tuscany. He became a member of the provisional government, and when, almost simultaneously, Rome was proclaimed a republic, he was sent there as a deputy, and was elected triumvir. On the taking of Rome by the French troops under Oudinot he went to Switzerland and thence returned to London. He bitterly attacked the course of France in public letters to De Tocqueville and others. At his instigation, as president of the Italian National Committee, risings in Milan (1853) and in Genoa (1857) were attempted. In 1859, while lending the whole weight of his influence to the revolutionary movements going on in Italy, he combated the threatened French intervention. He assisted in organizing Garibaldi's expeditions of 1860, 1862, and 1867. Though repeatedly elected by Messina to the Italian Parliament Mazzini refused to take his seat under a monarchical government. In 1866 the Italian government abrogated the sentence of death under which Mazzini had been living for many years, but he refused to accept a "pardon for having loved Italy beyond all earthly things." In 1868 he fell into a dangerous illness, from the effects of which his health never recovered, though his zeal remained as ardent as ever. After an ineffective scheme for a republican rising in Sicily in 1870 Mazzini ventured to enter Italy and was arrested at Gaeta, where he remained a prisoner till Rome was occupied by the Italian army. On his death, at Pisa, March 10, 1872, the Italian government accorded him a public funeral. Of the value of Mazzini's services to the cause of Italian independence there are widely differing opinions. Republicanism was a cardinal principle with him, to which he adhered with inflexible tenacity, never being willing to yield his personal conviction to the actual necessities of Italy as did Manin, Garibaldi, and Crispi. Hence he antagonized the Sardinian monarchy and obstructed the work of Cavour. His impassioned writings often led less noble spirits into deeds that he would not at all approve. Mazzini possessed in the highest degree that personal fascination by which friends are converted into ardent partisans. In his private life he was a model of purity and frugal simplicity, as in his public career he was conspicuous for disinterestedness and self-abnegation. In his political ideas he was of the type of the democratic visionaries of the eighteenth century with his almost metaphysical and religious ideas of social harmony and justice, but he was singularly lacking in an understanding of economic forces and their rôle in social evolution. He was associated for a while with Karl Marx in the first Socialist international organization, but his failure to appreciate the true nature of the modern workingman's movement made this association unprofitable and it was soon dissolved.

Bibliography. A comprehensive edition of Mazzini's works, in 18 volumes, *Scritti edite ed inedite*, appeared in Milan, 1861-91. Editions of his letters were published at Milan in 1875, at

Rome in 1885, and at Turin in 1888, and an English edition in six volumes at London in 1890-91. Consult: Simoni, *Histoire des conspirations mazziniennes* (Paris, 1870); Pietrode Nardi, *Giuseppe Mazzini, la vita, gli scritti e le sue dottrine* (Milan, 1872); E. A. Venturi, *Memoir of Joseph Mazzini* (London, 1877); Bouillier, *Un roi et un conspirateur: Victor Emanuel et Mazzini* (Paris, 1885); Saffi, *Il pensiero politico e sociale de Giuseppe Mazzini* (Rome, 1887); A. F. Schack, *Mazzini und die italienische Einheit* (Stuttgart, 1891); J. W. Mario, *Mazzini nella sua vita e nel suo apostolato* (Milan, 1891); W. J. Linton, *Recollections of Mazzini and his Friends* (London, 1892); Peretti, *Gli scritti letterarii di Giuseppe Mazzini* (Turin, 1904); Dora Melegari, *La giovine Italia e Giuseppe Mazzini* (Milan, 1906); John Maccunn, *Six Radical Thinkers* (London, 1907); R. S. Holland, *Builders of United Italy* (New York, 1908); W. R. Thayer, "Mazzini's Centenary," in *Italica* (Boston, 1908); *Cambridge Modern History*, vol. xi (New York, 1909); Bolton King, *Life of Mazzini* (new ed., ib., 1912); H. E. B. H. King, *Letters and Recollections of Mazzini* (London, 1912). See CAVOUR; GARIBALDI; ITALY.

MAZZONI, mât-sô'nê, GUIDO (1450-1518). An Italian sculptor, born at Modena and called *Il Modanino*. About 1491 he was employed at Naples and in 1495 he accompanied Charles VIII to France. His principal remaining works are groups, in colored clay, of life-sized figures lamenting over the body of Christ. The best are those in the churches of San Giovanni Decollata at Modena, Santa Maria della Rosa at Ferrara, and Monte Oliveto at Naples. They show unusual technique and a simple realistic treatment not common in that age. Other works by him are a group of the "Adoration," in the Duomo at Modena, and a bronze bust of King Ferdinand, in the Naples Museum.

MAZZONI, GUIDO (1859-). An Italian poet and scholar, born at Florence. He studied at Pisa and Bologna, was made professor of Italian language and literature at the University of Padua in 1887, and occupied the same position at the Florence Institute from 1894. His principal work as a scholar is *L'ottocento* (Milan), a history of Italian literature of the nineteenth century. Six collections of his verse appeared between 1882 and 1893.

MAZZONI, JACOPO (or GIACOMO) (1548-98). An Italian philosopher, born at Cesena. He studied at Bologna and Padua, held a professorship in the University of Pisa, and was called to a chair in the University of Rome by Pope Gregory XIII. He was one of the founders of the Accademia della Crusca. It is asserted that he defeated "the Admirable Crichton" (see CRICHTON, JAMES) three times in debate. Most of his writings were lost. Those extant include those in defense of Dante, viz., *Discorso composto in difesa comedia di Dante* (1572) and *Della difesa della comedia di Dante* (1587), and his philosophical works, *De Triplici Hominum Vita* and *In Universam Platonis et Aristotelis Philosophiam Præcludia* (1597).

MAZZUCHELLI, mât-sôo-kê'lê, GIOVANNI MARIA, COUNT (1707-65). An Italian literary encyclopædist; born at Brescia. He wrote biographies of Scipio Capece and Giusto de' Conti and edited Villani's biographies of illustrious Florentines. His principal and still indispensable work is the *Scrittori d'Italia* (6 vols., Brescia, 1753-63), conceived on such vast lines

that it reached only the letter B; four additional volumes of his notes, collected by his secretary, G. B. Rodella, are still unedited (Vatican); Narducci published *Giunte* thereto (Rome, 1884).

MAZZUOLA, mât-swô'la, FRANCESCO. See PARMIGIANO.

MEAD, mēd (AS. *medu*, OHG. *metu*, *mito*, Ger. *Meth*; connected with Ir. *meadh*, Welsh *medd*, mead, OChurch Slav. *medŭ*, Lith. *medus*, Lett. *maddus*, honey, Gk. *μέθυ*, *methy*, mead, Av. *madu*, wine, Skt. *madhu*, honey, sweet). A fermented liquor made from honey. The honey is mixed with water, malt and often spices added, and fermentation is induced and conducted in the usual manner. Mead has been in use from very ancient times and was known equally to the nations of southern Europe and the barbarous tribes of more northern regions. The name is also applied to a beverage flavored with sarsaparilla, and often charged with carbonic-acid gas.

MEAD, EDWIN DOAK (1849–). An American author and editor, born in Chesterfield, N. H. In 1866 he entered the employ of Ticknor and Fields, the Boston publishers. From 1875 until 1879 he studied at Oxford, Cambridge, and Leipzig, and upon his return to America began to lecture on American literature and politics. In 1883 he became director in Boston of the Old South Historical Work, and in 1889 succeeded Edward Everett Hale as editor of the *New England Magazine*, a position which he retained until 1901. He afterward devoted himself mainly to executive and literary work connected with the cause of international peace. His publications include *The Philosophy of Carlyle* (1881), *Martin Luther: A Study of the Reformation* (1884), *The Influence of Emerson* (1903), and many pamphlets on peace and arbitration.

MEAD, or **MEDE**, JOSEPH (1586–1638). A Church of England theologian. He was born at Berden, Essex. While a boy at school at Wethersfield he bought a copy of Bellarmine's Hebrew grammar and soon acquired a good knowledge of the language. He graduated at Christ Church, Cambridge, in 1610. In 1613 he was made a fellow of his college and reader of the Greek lectures on Sir Walter Mildmay's foundation, which office he occupied till his death. He was learned in mathematics, medicine, and various branches of natural science, history, antiquities, and the literature and sciences of the East. His chief work was *Clavis Apocalyptica* (1627), translated into English in 1643, which has been called the first rational attempt to interpret the Apocalypse. His complete works were published at London, 1648–52; new edition, with life, 1672. Consult Neal, *History of the Puritans*.

MEAD, LARKIN GOLDSMITH (1835–1910). An American sculptor. He was born at Chesterfield, N. H., and studied under Henry K. Brown, of Brooklyn, N. Y. His earliest work in marble was called "The Recording Angel." In 1857 he modeled the colossal statue "Vermont" for the dome of the State House at Montpelier. "Ethan Allen" adorns the same building. During the Civil War he was for six months an artist for *Harper's Weekly*. After 1862 he resided chiefly at Florence. There he executed a number of statuettes, such as "Echo," "La Contadinella," "Sappho," "Mountain Boy," and "The Returned Soldier" (1866). His other works include the Lincoln monument at Springfield, Ill.; the sol-

diers' monument at St. Johnsbury, Vt.; "Columbus' Last Appeal to Isabella," Sacramento, Cal.; the statue of Ethan Allen (1874) in the National Statuary Hall at Washington; and the group, "The Return of Proserpine from the Realms of Pluto," in the main entrance of the agricultural building at the Columbian Exposition at Chicago. He executed a group of the Stanford family for Stanford University, California. Among his other works of note were a colossal statue, "The Mississippi River," for the Minneapolis courthouse, and portraits in bronze of John Hay, W. D. Howells, and Henry James. His work is characterized by fine feeling for effect, by precise and conscientious though somewhat harsh modeling, and by an abundance of detail. He was a brother of William Rutherford Mead.

MEAD, RICHARD (1873–1754). An English physician. He was born at Stepney and at an early age entered the University of Utrecht. After three years' study he went to Leyden, where he entered upon the study of medicine under the noted Professors Pitcairne and Hermann. Having taken his degree of doctor of philosophy and physics, he returned to Stepney and began the practice of his profession in 1696. In 1703 Dr. Mead was made a member of the Royal Society and a lecturer at St. Thomas's Hospital. His reputation both as a practitioner and as a writer on medical subjects was very great, and he was in constant correspondence with the most eminent scientists of the day in his own and foreign countries. He received the appointment of physician in ordinary to George II, and in 1716 was elected a fellow of the College of Physicians. In addition to his acquirements as a physician Dr. Mead devoted much time to the study of natural history, antiquarianism, and numismatics. He was an intimate friend of Bentley, Pope, and Johnson. Some of his works were first published in Latin and subsequently translated into English, French, and Italian. They include *A Mechanical Account of Poisons* (1702); *A Short Discourse concerning Pestilential Contagion* (1720; 8th enlarged ed., 1722); and *Monita et Præcepta Medica* (1751).

MEAD, WILLIAM RUTHERFORD (1846–). An American architect, born in Brattleboro, Vt., a brother of Larkin G. Mead. He graduated from Amherst College in 1867 and studied architecture under the late Russell Sturgis (q.v.), after which he spent nearly two years in foreign travel and study. He began the independent practice of architecture in 1872 in partnership with Mr. Charles F. McKim (q.v. for some of the most notable works of the firm). Two years later Mr. W. B. Bigelow joined them, but severed this connection in 1878; and in 1879, on the addition of the late Stanford White (q.v.) to the firm, it assumed the name of McKim, Mead, and White, by which it is still known. The hand and influence of Mr. Mead are traceable in all the works of this distinguished firm, though he never assumed supreme control of any of them. He became fellow of the American Institute of Architects (1902), a member of the American Academy of Arts and Letters, and president of the American Academy in Rome. In 1902 he received the degree of LL.D. from Amherst College, was elected to the National Academy of Design in 1910, and received the Gold Medal of Honor of the National Institute of Arts and Letters.

MEADE, mēd, GEORGE GORDON (1815-72). An American soldier, born of American parentage at Cadiz, Spain, Dec. 31, 1815. He attended school in Philadelphia, Washington, and Baltimore; graduated at West Point in 1835, and served in the Seminole War. In October, 1836, he resigned from the army, adopted the profession of civil engineer, and between 1837 and 1842 was employed as an assistant engineer in the surveys made by the United States government of the delta of the Mississippi, the Texas boundary, and the northeastern boundary of the United States. In 1842 he was reappointed to the army as a second lieutenant in the corps of topographical engineers. On the breaking out of the war with Mexico, when General Taylor crossed the Rio Grande, he was ordered to the front and served with distinction throughout the war. Later he was employed in superintending river and harbor improvements and in the construction of lighthouses on Delaware Bay and off the coast of Florida. He was promoted to be first lieutenant in 1851 and captain in 1856 and had charge of the national survey of the northern lakes until 1861. At the outbreak of the Civil War he was ordered to Washington; was commissioned brigadier general of volunteers Aug. 31, 1861, and was placed in command of the second brigade of the Pennsylvania reserve corps. He was in the action at Dranesville, Va., December 20; was at Mechanicsville, June 26, 1862, and at the battle of Gaines's Mill on the following day; and served with his reserves throughout the Peninsular campaign, being severely wounded, June 30, at the battle of Frazier's Farm. On August 29-30, having recovered from his wound, he was engaged in the second battle of Bull Run, and in September took command of a division of the First Army Corps. At the battle of Antietam he was slightly wounded and had two horses shot under him. In recognition of his gallantry in this battle he received command of the Fifth Army Corps and on Nov. 29, 1862, was commissioned major general of volunteers. He was engaged in the battles of Fredericksburg and Chancellorsville, covering the retreat at Chancellorsville with his corps and guarding the crossings until the entire army was safely over the Rappahannock. On June 28, 1863, he was unexpectedly ordered to succeed General Hooker in the command of the Army of the Potomac. The main army of the Confederates, under General Lee, had invaded Pennsylvania, and it devolved upon Meade to arrest this movement and drive back the enemy. Portions of Lee's army had reached York, Carlisle, and the Susquehanna; but upon the advance of the Federal army these were called in. On July 1 the hostile armies met at Gettysburg and a three days' battle ensued, which resulted in the utter discomfiture of Lee, who, however, was not pursued with any vigor. (See GETTYSBURG, BATTLE OF.) For this victory Meade was publicly thanked by a resolution of Congress passed Jan. 28, 1866. From May 4, 1864, to April 9, 1865, General Meade commanded the Army of the Potomac, under General Grant, through the bloody struggle in the Wilderness and until the surrender of Lee. On Aug. 18, 1864, he was commissioned a major general in the United States army. At the close of the war he was placed in command of the Military Division of the Atlantic, which command he retained from July 1, 1865, to Aug. 6, 1866. During the years 1866-67 he

was in command of the Department of the East, and subsequently of the third military district of the South (under the reconstruction laws). From March, 1869, until his death he was again in command of the Military Division of the Atlantic. He died on Nov. 6, 1872. Citizens of Philadelphia presented him with a house, and after his death a fund of \$100,000 was collected by subscription and presented to his family. Consult R. M. Bache, *Life of General G. G. Meade* (Philadelphia, 1897), and I. R. Penny-packer, *General Meade* (New York, 1901), in the "Great Commanders Series."

MEADE, RICHARD WORSAM (1837-97). An American naval officer, born in New York City. He entered the navy as midshipman in 1850; became navigating officer of the *Cumberland* in 1856; cooperated with General Sherman as commander of a division of the squadron off Helena, Ark., in breaking up guerrilla warfare on the Mississippi River in 1862-63; commanded the marines in New York City during the draft riots there in July, 1863; and subsequently served with distinction in the South Atlantic and West Gulf blockading squadrons. After the close of the war until 1868 he acted as head of the department of seamanship and naval tactics at the United States Naval Academy. He then served for a time in Alaska, and from 1871 to 1873, in command of the *Narragansett*, cruised in the Pacific. After his return he acted as president of the board appointed to revise the ordnance instructions of the navy. He was promoted to be captain in March, 1880, and to be commodore in May, 1892. He was naval commissioner of the government to the World's Columbian Exposition at Chicago, and succeeded Admiral Stanton in command of the North Atlantic squadron in 1894. In the same year he was promoted to be rear admiral, but a disagreement between him and the Navy Department led to his retirement at his own request in May, 1895.

MEADE, WILLIAM (1789-1862). A Protestant Episcopal bishop of Virginia. He was born near Millwood, Va., graduated at Princeton in 1808, studied theology, and was ordained priest in 1814. He was appointed assistant minister at Millwood, was afterward rector of Christ Church, Alexandria, Va., and in 1821 returned to Millwood as rector. In 1829 he was appointed Assistant Bishop and in 1841 Bishop of Virginia. He contributed liberally to the foundation of the Diocesan Theological Seminary at Alexandria. He was an active member of the American Colonization Society and was one of the founders of the Evangelical Knowledge Society (1847). In 1861 he labored to prevent the secession of Virginia, but acquiesced when that action was finally determined upon. Meade was strongly opposed to the Oxford Movement (q.v.) in the Church of England, and in his efforts to raise the Protestant Episcopal church in Virginia from a condition of spiritual apathy, which were successful, he was influenced by Evangelical or Low Church sympathies. (See EVANGELICAL.) His principal literary productions are: *Family Prayers* (1834); *Letters on the Duty of Affording Religious Instruction to those in Bondage* (1834); *Companion to the Font and the Pulpit* (1846); *Lecture on the Pastoral Office* (1849); *Lectures to Students* (1849); *Reasons for Loving the Episcopal Church* (1857); *Old Churches, Ministers, and Families of Virginia* (1857); *The Bible and the Classics*

(1861). A memorial of Bishop Meade was published by the coadjutor bishop of his diocese, the Rev. Dr. John Johns (Baltimore, 1867).

MEADOW, mēd'ō (AS. *mæd*, OFries. *mede*, meadow, OHG. *mata-screch*, grasshopper, Ger. *Matte*, meadow; probably connected with OHG. *mæn*, Ger. *mähen*, AS. *māwan*, Eng. *mow*, Lat. *metere*, Gk. *ἀμῶν*, *aman*, to reap, OIr. *meithel*, party of reapers). A tract of low, level land, especially upon the margin of a stream, in which the dominant plant forms are grasses and sedges. Meadows are very characteristic of New England, northern Europe, and many mountainous regions. Some writers hold that meadows are the product of artificial conditions; others that they are natural formations. It seems scarcely to be doubted that alpine meadows are natural, either because trees fail to obtain a foothold on account of snowslides or because the snow remains long in such situations and grasses take possession during the short summer if there is sufficient soil moisture. Meadows may be due to continued grazing or mowing, because tree vegetation may be kept down by such agencies. On the other hand, they are extremely unfavorable for the development of trees, which might fail to develop even in a region specially favorable to tree growth, since seeds would germinate with difficulty. Hence a meadow may perpetuate itself naturally, even though originally artificial. Besides the grasses other plants are found in meadows, among which are species of vernal herbs, which mature before mowing time arrives. Some botanists, as Wettstein, believe that plants have acquired certain habits which adapt them to life in meadows that are annually mowed.

Since 1899 the term "meadow" has been used in the soil surveys of the United States government to designate various types of wet land, even some covered with trees.

From an agricultural standpoint a meadow is either a lowland or an upland field upon which hay or pasture grasses grow from self-sown or hand-sown seed. They are also permanent or temporary as well as natural and artificial. When the grasses are fed down by stock, meadows are called pastures. For artificial meadows the soil is plowed deep and brought to the very best condition before the seed is sown. A rich, clean soil of fine tilth adds greatly to the weight of the crop. Frequently grass seed is sown with small grain as a nurse crop, but the practice is not always successful, since the faster-growing cereal deprives the young grasses of light and they consequently fail. The best method is to sow the grass seed broadcast without a nurse crop. Timothy, redbud, fescue grass, orchard grass, oat grass, rye grass, blue grass, bent grass, and many other grasses are very commonly grown either as mixtures or alone. Timothy is often grown as a single crop. Clover is frequently added to a grass mixture. When a mixture is grown for hay, grasses which bloom about the same time are selected, but when used for pasture species that ripen at different times are preferred. Mowing machines and other implements have quite revolutionized the method of haymaking within the last 50 years and have enabled the farmer to make use of more extensive meadows than when all the work was done by hand. See also HAY; PASTURE. Consult Joseph E. Wing, *Meadows and Pastures* (Chicago, 1911).

MEADOW FESCUE. See FESCUE.

MEADOW FOXTAIL. A valuable fodder grass. See FOXTAIL GRASS.

MEADOW GRASS. A name applied to many of the numerous species of the genus *Poa*, which are chiefly natives of the temperate and colder parts of the world and form a very important part of the herbage of pastures and meadows. Most of the species are slender, nutritious, and rather abundant. The rough-stalked meadow grass (*Poa trivialis*) and the blue grass or smooth-stalked meadow grass (*Poa pratensis*) are among the most common and are esteemed among the most valuable for sowing in mixtures of grasses for pasture and for lawns. The Abyssinian meadow grass (*Poa abyssinica*), an annual species, yields immense returns of herbage in its native country. *Poa annua* is a common species, frequently found as a weed in cultivated grounds, but it is employed with advantage for sowing on lawns in towns and wherever from any cause perennial grasses are apt to be destroyed. It is often to be seen in flower, and is said to ripen its seeds in four or five weeks from the time of sowing. It is very abundant in most parts of Europe. Canada blue grass, *Poa compressa*, is a common species, the seed of which is often used as an adulterant of the true blue grass or smooth meadow grass. The name meadow grass is sometimes given to species of *Alopecurus*, which are more commonly known as foxtail grass (q.v.). See BLUE GRASS.

MEADOW LARK. A North American starling-like bird frequenting meadows and open places. Few American song birds are more general favorites. This is not a lark at all, but belongs to the family Icteridae and is therefore a near relative of the bobolink, oriole, and blackbird. The genus (*Sturnella*) contains only two well-marked species, the common meadow lark (*Sturnella magna*) of the eastern United States and the Western meadow lark (*Sturnella neglecta*), but there are two subspecies of the Eastern bird which differ but slightly from the true *magna magna*. The common meadow lark ranges in summer from New Brunswick to the Gulf of Mexico, east of the Mississippi, and even in winter only retreats as far south as southern New England and Illinois. The Western meadow lark occupies the western half of the continent and extends southward into western Mexico, while other subspecies occur in Cuba and Mexico. Meadow larks are about 10¾ inches in length, with large feet and a long, straight, sharp bill. The feathers of the upper surface are prevailing black, with rufous and buff borders and tips, so that the whole upper surface is variegated with those three colors. The throat, breast, and anterior half of the belly are bright yellow, with a prominent black crescent about the middle of the breast. The tail feathers are narrow and short, and when the bird takes to the wing the white outer ones become very conspicuous. The Western meadow lark has lighter upper parts, more perfect, less confluent bars on the tail feathers, and the sides, as well as the front, of the throat are yellow. The notes of the meadow lark are clear and strong—a sort of cheerful whistle—but Chapman says that they differ in different localities, so that the notes of the Florida birds are markedly different from those heard in the Northern States. The notes of the Western meadow lark are famous for their musical quality. The contrast between its brilliant song and that of the Eastern form, added to other peculiar traits, is convincing of the full

specific rank of the Western bird. Consult on this point Coues, *Birds of the Northwest* (Washington, 1874).

Meadow larks feed upon both seeds and insects, which they obtain upon the ground in the open meadows and fields. In summer they are not gregarious, though several pairs may be seen in neighboring fields; but in winter they are often found in swamps in some numbers. The nest is built upon the ground and is composed of grasses so arranged as to arch over at the top and make a more or less completely covered shelter. The eggs (see Colored Plate of EGGS OF SONG BIRDS) are four to six in number, large for the size of the bird, white, marked chiefly at the larger end with bright brown. Although not a game bird, meadow larks are frequently hunted both for sport and food, but they are not especially desirable for the table, and the shooting of them is nearly everywhere illegal. See Plate of LARKS AND STARLINGS.

MEADOW MOUSE. The American name for the short-tailed wild mice of the genus *Microtus* of the class called voles in Europe. The commonest species is the widespread *Microtus pennsylvanicus*, called in the older books *Arvicola riparia*. Many other species and subspecies are catalogued. See Plate of MICE AND JERBOAS in article MOUSE.

MEADOW MUSSEL, or HORSE MUSSEL. See MUSSEL.

MEADOW RUE. See Plate of MINT.

MEADOW SAFFRON. A European plant. See COLCHICUM.

MEADOW SNIPE. A gunner's name for snipe frequenting grassy places, especially Wilson's and the jacksnipe. (See SNIPE.) The marsh hens and corn crake are often called meadow crake or drake, meadow clapper, etc., by sportsmen. See PECTORAL SANDPIPER.

MEADOW SWEET. A plant. See SPIRÆA.

MEADOW VETCHLING. See LATHYRUS.

MEADVILLE. A city and the county seat of Crawford Co., Pa., 122 miles by rail north of Pittsburgh, on French Creek and on the Erie, the Northwestern Pennsylvania, and the Bessemer and Lake Erie railroads (Map: Pennsylvania, A 2). It is the seat of Allegheny College (Methodist Episcopal), established in 1815, and of the Meadville Theological School (Unitarian), opened in 1844; and has four schools of music, two city hospitals, a fine courthouse, and a public library. Other noteworthy features are Huidekoper, Diamond, and Oakwood parks, and three iron bridges. Meadville is in a fertile agricultural valley, and its industries are represented by railroad shops of the Erie, iron works, malleable-iron works, vise works, planing and flour mills, breweries, a distillery, and manufacturing of automatic tanks and cans, tools, brass and iron castings, chemicals, lumber, mantels, corsets, vaults, etc. The city is also an important market and a shipping point for the oil regions. The commission form of government, providing for a mayor and four councilmen, was adopted in 1913. Settled in 1788, Meadville became a borough in 1823 and was chartered as a city in 1866. The municipality owns the water works and electric-light plant. Pop., 1900, 10,291; 1910, 12,780; 1920, 14,568.

MEAFORD, mē'fērd. A lake-port town of Grey Co., Ontario, Canada, on Nottawasaga Bay, an inlet of Georgian Bay, Lake Huron, 20 miles west-northwest of Collingwood, on the Grand Trunk Railway (Map: Ontario, D 4). It

has a fine harbor, with a depth of 20 feet of water. There is an armory. The industrial establishments include brickyards, fruit evaporators, grain elevator, flour mills, tannery, canning factory, and manufacturing of builders' materials, furniture, blankets and yarns, flooring, boxes, foundry and machine-shop products. There is excellent steamboat communication with western ports. Electric power is available for manufacturing. The town is situated in an apple-growing district. Pop., 1901, 1916; 1911, 2811; 1915 (local est.), 3200.

MEAGHER, mā'hēr, THOMAS FRANCIS (1823-67). An Irish-American soldier. He was born at Waterford, Ireland, Aug. 3, 1823, and was educated at the Jesuit College of Clongowes Wood, County Kildare, and at Stonyhurst College, Lancashire, England. On the outbreak of the French revolution of 1848 he was sent to Paris by the Irish Confederation to congratulate the republican leaders. On his return he was arrested on a charge of sedition and was later tried for high treason, found guilty, and sentenced to death, but subsequently the sentence was changed to banishment for life to Tasmania. Transported thither, he escaped in 1852 and succeeded in reaching New York. Subsequent to 1855 he practiced law in New York, and in 1856 became editor of the *Irish News*. At the beginning of the Civil War in 1861 he organized a company of zouaves, joined the Sixty-ninth New York Volunteers, was acting major at the first battle of Bull Run, and after serving the three months of the first call, returned to New York and organized the Irish brigade, being commissioned brigadier general on Feb. 3, 1862. He served in the latter part of the Peninsular campaign and participated in the second battle of Bull Run and in the battles of Antietam and Fredericksburg, in the last of which he was seriously wounded while leading a charge on Marye's Heights. After Chancellorsville he resigned because little was left of his brigade, but he was recommissioned in 1864 and for some time was in command of the District of Etowah. He was appointed secretary of Montana Territory in 1865, and in 1866 served as Governor pro tempore. On July 1, 1867, he fell from the deck of a steamer, at Fort Benton, on the upper Missouri, and was drowned. He published *Speeches on the Legislative Independence of Ireland* (1852) and *Last Days of the Sixty-Ninth in Virginia* (1861). Consult M. Cavanagh, *Memoirs of General Thomas Francis Meagher, with Selections from his Speeches, Lectures, etc.* (Worcester, Mass., 1892).

MEAGRE, mē'g'r, or **MAIGRE,** mā'g'r (OF., Fr. *maigre*, lean, from Lat. *macer*, lean; connected with Gk. μακρός, *makros*, long). Any of several European drumfish of the world-wide genus *Sciaen*a. The typical meagre is *Sciaen*a *aquila*, which ranges from Great Britain to the coasts of the Indian Ocean, but is best known about the Mediterranean Sea, where it has been very highly esteemed since the days of antiquity. It reaches a length of 6 feet, but ordinary specimens are about half that. The color is brownish gray on the back, with silvery gray sides and a white abdomen. It has always been highly valued, especially by the Italians, but to English palates the flesh seems rather dry and tasteless. A closely related species is the umbrine (*Sciaen*a *umbrina*), also one of the favorite food fishes of the Mediterranean, and occasionally taken near Great Britain and elsewhere.

MEAL. Sometimes used to mean ground wheat (flour), but more often to mean some other ground cereal, as oat meal or corn meal, or similar product, as cassava meal or banana meal. See BREAD; FLOUR; MAIZE, *Feeding Value*.

MEAL, COTTONSEED. See COTTONSEED AND ITS PRODUCTS.

MEAL MOTH. A pyralid moth (*Pyralis farinalis*), cosmopolitan in distribution, which infests milling establishments and storerooms and which in the larval stage feeds upon stored grain, bran, and even straw, and occasionally upon dried plants in herbaria. A closely allied species (*Pyralis costalis*) is known as the clover-hay worm. There are probably four generations annually. The eggs are laid in small clusters and the larvæ live in long tubes constructed of silk and particles of meal and other material, and while thus incased in the obscure corners in which they habitually live they are completely concealed from observation. Another species, commonly called the Indian-meal moth (*Plodia interpunctella*), in the larval stages feeds not only upon Indian meal, but upon all sorts of dried vegetable products, such as peas, beans, nuts, acorns, and dried fruit, and upon root and bark preserved in drug stores.

MEAL WORM. The larva of either one of two or more beetles of the family Tenebrionidæ, which, originally of Asiatic or European origin, have become cosmopolitan enemies of meal, flour, bran, and other mill products. They develop in refuse grain dust accumulated in dark corners and out-of-the-way places in flour mills, bakeries, stores, and stables. They are also of importance as enemies to ship biscuits and other kinds of crackers. These meal worms are easily bred in confinement, have a commercial value to the bird dealer, and are kept on sale in bird stores as food for soft-billed cage birds. The yellow meal worm (*Tenebrio molitor*) is the commonest of these insects. The beetle is over half an inch in length, somewhat flattened, shining, and nearly black; and the larva is cylindrical, slender, over an inch long, and has a waxy appearance and a yellowish color. The eggs are white, bean-shaped, about one-twentieth of an inch long, and are deposited in the meal or other food substance. The dark meal worm (*Tenebrio obscurus*) is very similar to the yellow meal worm, but dull black in color; it has been found in black pepper, phosphate fertilizers, cottonseed and cotton meals, and in commercial soda ash. Perfect cleanliness about storerooms and milling establishments is the best preventive of the attacks of these insects, and rooms or buildings once infested may be freed by the use of disulphide of carbon or hydrocyanic acid gas. Consult F. H. Chittenden, in *United States Department of Agriculture, Division of Entomology, Bulletin No. 4*, N. S. (Washington, 1896).

MEALY BUG. A naked scale insect of the genus *Dactylopius*, so called because of the white, meal-like powder which covers it. Like other members of the subfamily Coccinæ, the body is not covered by a scale, and the females keep the form of the body with the segments distinct until the end, and also retain the power of motion. The antennæ of the female are six-jointed in the larva and eight-jointed in the adult; the male larva has seven-jointed antennæ. The tarsi are furnished with four digitules, and the anal ring with four hairs. Most of the mealy bugs are tropical or subtropical, but several

species breed abundantly out of doors in the southern United States, e.g., *Dactylopius citri*, a well-known enemy of orange groves in Florida. It is, however, as greenhouse pests in temperate

THE MEALY BUG.

a, female (enlarged); b, group of mealy bugs on a tree.

regions that the mealy bugs are best known. They secrete a certain amount of honeydew, and are frequently attended by ants, which are responsible for much of the spread of mealy bugs in greenhouses, since they attend the young bugs and carry them to appropriate feeding grounds. The mealy secretion which covers these bugs renders it difficult to destroy them with some of the insecticide mixtures, but a dilute kerosene-soap emulsion is efficacious. Consult J. H. Comstock, *Report of the United States Department of Agriculture* (Washington, 1880), and J. H. and A. B. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, N. Y., 1909). See COCCIDÆ.

MEALYWING. A bug of the family Aleyrodidæ, so called from the white, meal-like excretion on the wings of the adult insect. The mealywings are allied to the aphids and scale insects. They are very small, frequently minute, and infest the leaves of plants, both of herbs and of trees, usually on the lower side. In their early stages they are scalelike and much resemble some of the Coccidæ. Unlike the Coccidæ, the two sexes develop in a similar manner, and both males and females are active and have two pairs of wings. In the early stages the body may be more or less covered with wax. The antennæ of the adults are seven-jointed, and the eyes are usually constricted near the middle, being sometimes entirely divided. The wings are broad and well rounded, and may be clear or spotted and banded in different ways. About 150 species are known, of which more than 50 occur in the United States. The most destructive species is *Aleyrodes citri*, which attacks the orange and lemon in Florida and Louisiana and causes the leaves to turn yellow and die. They secrete a considerable amount of honeydew, which attracts the spores of smut fungi, resulting ultimately in the blackening of the foliage of the orange trees.

MEAN (OF. *meien*, *moien*, Fr. *moyen*, from Lat. *medianus*, middle, from *medius*, middle). In mathematics, a term interpolated between two other terms of a series. The arithmetic mean

of two quantities a , b , is $\frac{a+b}{2}$, their geometric mean is $\sqrt{ab}$, and their harmonic mean is $\frac{2ab}{a+b}$.

The arithmetic mean is greater than the geometric mean, and the latter is greater than the harmonic mean. In averaging observed results of physical experiments the mean result may be found by dividing the sum of the observed results by the number of observations. But in case the observed results are not regarded as equally accurate, certain numbers may be as-

signed to these results representing their relative accuracy; e.g., four men, A, B, C, D, have determined the area of a triangle and found it to be 19.50, 19.75, 20, and 20.25 square meters, respectively. If the relative accuracy of their work may be represented by the numbers 3, 2, 2, 4 respectively, the area of the triangle will be taken as

$$\frac{3 \cdot 19.50 + 2 \cdot 19.75 + 2 \cdot 20 + 4 \cdot 20.25}{3 + 2 + 2 + 4} = 19.91.$$

For further practical methods of averages, see LEAST SQUARES, METHOD OF; GEOMETRIC MEAN.

MEAN CENTRE OF POINTS, or **MEAN POSITION**, CENTRE OF. See CENTRE.

MEAN'DER. A river of Asia Minor. See MEANDER.

MEANDER, or **MEANDER**. A classic form of running ornament, substantially the same as the Greek fret (q.v.), composed of elements successively turning sharp angles (usually right angles) so as to wind in and out while progressing as a whole in one direction. The name is derived from the river Mæander (q.v.), which was famed for its devious windings. The Greek wave, or Vitruvian scroll, is its curvilinear analogue.

MEAN DURATION OF LIFE. See LIFE, MEAN DURATION OF.

MEAN'ING (from *mean*, AS. *mænan*, OHG. *meinan*, Ger. *meinen*, to think; connected with OChurch Slav. *měniti*, Skt. *man*, to think). The mental processes that constitute the unanalyzed consciousness of ordinary, everyday experience are always surcharged with meaning or significance. Mind, as it is given, is mind in function, mental stuff that stands for, represents, symbolizes, refers to objects and events in the outside world. The value and validity of such objective reference form a question for epistemology. (See KNOWLEDGE, THEORY OF.) The psychological problem, on the other hand, is to determine, first, whether meaning is intrinsic to mental process, and, secondly, how meaning is represented in consciousness.

The first of these questions must, apparently, be answered in the negative; there are many facts which lead us to the view that meaning is extrinsic and not intrinsic to mental process. 1. A meaning may be added to a given experience. A diagram in a scientific book lacks a meaning until we read the legend beneath it; a particular tonal experience may mean "sound," "whistle," "fire," or "fair weather," and we may add as many other meanings as we like. 2. A meaning may be observed to "grow" or to develop; as one follows the progress of a sketch beneath the artist's hand, or reads and rereads a complex argument, the meaning of lines and colors, or of successive sentences, slowly "dawns" upon one. 3. It is possible to strip the meaning from an item of experience; if a word is repeated aloud many times over, or if a printed word is stared at for some time, the sound or sight presently becomes strange and the familiar meaning drops away. (For like phenomena in the sphere of pathology, see APHASIA.) 4. Occasionally mental process and meaning are disjoined in time; we often ask to have a statement repeated, but before it is repeated the meaning has come. It seems clear, therefore, that meaning and mental process are separable; and the further treatment of meaning, in its own right, may therefore be left to logic.

There remains, however, the second psychologi-

cal problem: to discover how meaning is represented in consciousness. It follows from the previous discussion that no single element of mind, no isolated sensation, can mean; meaning will appear only when some other mental process is added or accrues to it. The accruing process, as context or setting, may then "give" a meaning to the first. Analysis shows, in fact, that when meaning is consciously present the experience divides into "core" and "fringe," into presentation proper and vehicle of meaning. Let us suppose, for the sake of illustration, that two persons, A and B, are walking along a lonely road at night; that A is unfamiliar with the region and is therefore apprehensive lest wild animals may be in the neighborhood, but that B knows the country thoroughly and has no such fear. Both hear a sound in the bushes, and the two auditory experiences are to all intents and purposes identical, yet A takes the sound to mean "bear," while B interprets it, perhaps, as "dog." The associative supplementing or imaginal fringe of the presented sound differs, and this difference places a different meaning on the core of the experience. The processes of the "fringe," whatever they may turn out to be on further psychological analysis, are the context or setting of the presentation and the vehicle of its meaning.

If we now proceed to ask how this functional differentiation of core and fringe has come about we must go for an answer to biology. The organism is placed within an environment, which affects it primarily by way of the organs of sense, and to which it responds primarily by way of movement. We may assume, then, that meaning is at first carried by kinæsthesia: some environmental stimulus sets up a sensory process, the organism meets the physical situation by instinctive movement, and the "feel" of the movement is the context of the presentation. Children, we may note, begin to define objects in terms of motor response: a knife is what you cut with, a bag is what you put things into. But as evolution proceeds situations become more complicated, and may be internal as well as external, mental as well as physical. Kinæsthesia, while it remains important, ceases to be the sole carrier of meaning; all sorts of processes are pressed into that service; so that, in the instance taken, the meaning "bear" may have been carried by a verbal image and an organic shudder, the meaning "dog" by a fleeting visual image of some familiar animal.

We have not yet, however, exhausted our illustration. A and B, it is plain, are subject to different determining tendencies; the one is apprehensive of danger, the other feels himself secure. These tendencies determine the nature of the associative supplementing, and are thus responsible for the difference of meaning which comes to consciousness as "bear" and "dog." It must not be supposed, however, that meaning is always of this conscious sort. The habitual situations of everyday life are very often taken meaningfully, although their meaning has no discernible representation in consciousness: we avoid a puddle in the path, we open a book and read, we feel a draft and put down the window, without any supplementary processes that mean wet feet, or the getting of information, or an impending cold. When the situation is new every presentation has its conscious context; but as time goes on, and the same situation is

repeated again and again, this context gradually fades out, until ultimately nothing remains but a nervous predisposition, and meaning is carried in purely physiological terms.

Titchener, *Experimental Psychology of the Thought Processes* (ib., 1909); id., *Textbook of Psychology* (ib., 1910); W. B. Pillsbury, *Essentials of Psychology* (ib., 1911); G. F. Stout, *Manual of Psychology* (London, 1913).

MEANS SMOKE TELEGRAPH. See MILITARY AERONAUTICS.

MEARES, mērz, JOHN (c.1756-1809). An English navigator. He entered the navy in 1771, served against the French in the West India Islands, and at the conclusion of peace in 1783 became captain in the merchant service. He went to India and formed at Calcutta what was called the Northwest America Company for opening trade with Russian America. In 1786 he explored a part of the coast of Alaska. He went to China by way of the Hawaiian Islands and entered Nootka Sound (1788). The next year he sent to Nootka Sound three ships which were seized by the Spaniards on the ground that Englishmen had no right to trade in those waters. The act caused great excitement in England and a large fleet known as the Spanish Armament of 1790 was collected to punish the Spaniards, who saved themselves only by making ample reparation. Meares published *Voyages Made in the Years 1788 and 1789 from China to the Northwest Coast of America* (1790).

MEARIM, mǎ'á-rēn'. A river in the State of Maranhão, Brazil, rising in the Serra do Negro and flowing north into the Bay of São Marcos near the city of Maranhão (Map: Brazil, J 4). It is about 680 miles long and is navigable to small vessels as far as Barra do Corda.

MEARNS, mērnz. A county of Scotland. See KINCARDINESHIRE.

MEARS, mērz, HELEN FAIRSWORTH (1878-1916). An American sculptor. She was born at Oshkosh, Wis., and studied at the State Normal School in Oshkosh and art in New York and Paris. Her most important works include a marble statue of Frances E. Willard (1905, Capitol, Washington); portrait reliefs of Edward MacDowell (Metropolitan Museum, New York) and Augustus Saint-Gaudens; portrait busts of George Rogers Clark and William L. G. Morton, M.D. (Smithsonian Institution, Washington). In 1904 her "Fountain of Life" (St. Louis Exposition) won a bronze medal. She made New York her residence and exhibited there and in Chicago.

MEARS, JAMES EWING (1838-). An American surgeon. Born at Indianapolis, he received his education at Trinity College, Conn. (A.M., 1861; LL.D., 1908), and Jefferson Medical College, Philadelphia (M.D., 1865). During the Civil War he served as captain and as medical cadet and practiced in Philadelphia after 1865. From 1870 to 1898 he was professor of anatomy and surgery at the Pennsylvania College of Dental Surgery and held the office of surgeon in chief of the Pennsylvania National Guard. He contributed largely to the surgical journals and is author of *Practical Surgery* (1878; 2d ed., 1885).

MEASLES, mē'z'lz (from MDutch *maselen*, *masselen*, spots; connected with OHG. *masala*, *masara*, Ger. *Maser*, dim. of OHG. *māsa*, Ger. *Mase*, spot, mark of a wound), known also as

RUBEOLA and MORBILLI. One of the group of diseases termed *exanthemata*. (See EXANTHEMA.) It is communicable from person to person and seldom occurs more than once in the same individual. After a period of incubation of about a fortnight, appear headache, slight disturbance of the stomach, rise of temperature towards evening, lassitude, slight injection of the eyes, with trifling coryza. After 48 to 72 hours coryza is marked. In the mouth are seen the signs of the disease, the exanthema, "Koplik's spots." These are isolated rose-red spots, with a minute bluish-white centre on normally colored mucous membrane.

The characteristic eruption usually appears upon the fourth day from the commencement of the febrile symptoms and the catarrh, seldom earlier, but not infrequently some days later. It is a rash, consisting at first of minute red papulæ, which, as they multiply, coalesce into crescentic or irregular patches. It is two or three days in coming out, beginning on the face and neck, and gradually traveling downward. The rash fades in the same order as it occurs, and, as it begins to decline three days after its appearance, its whole duration is about a week. The red color gives way to a somewhat yellowish tint, and the cuticle crumbles away in a fine branlike powder, the process being often attended with considerable itching.

There are two important points in which it differs from smallpox (q.v.), with which in its early stage it may be confounded; they are: (1) that the fever does not abate when the eruption appears, and (2) that the disease is not more severe because the eruption is plentiful or early. The character of the eruption, after the first day, will serve to remove all doubt regarding these two diseases; and the comparative prevalence of either disease in the neighborhood will assist in diagnosis. It is distinguished from scarlet fever (q.v.) or scarlatina (1) by the presence at the outset of catarrhal symptoms, which do not occur in the latter disease, at any rate, prior to the eruption; (2) by the absence of the throat affection, which always accompanies well-marked cases of scarlet fever; (3) by the character of the rash, which in measles presents somewhat the tint of the raspberry and in scarlet fever that of a boiled lobster; which in measles appears in patches and in scarlet fever is universally diffused.

In ordinary uncomplicated measles the prognosis is favorable. The chief danger is from broncho-pneumonia, and in feeble children it often leaves chronic bronchial mischief behind it. No age is exempt from the disease, but it is much more common in childhood than subsequently, a second attack being comparatively rare.

In mild forms of the disease nothing more is requisite than to keep the patient on a low diet, attend to the bowels, and prevent exposure to cold, which is best accomplished by keeping him in bed with the ordinary warmth to which he is accustomed in health. If pulmonary complications appear they must be treated according to their nature. Bronchitis (q.v.), sometimes extending into pneumonia (q.v.), is most to be feared. If the eruption is delayed or disappears prematurely, it may sometimes be brought back by placing the patient in a warm bath. In such cases stimulants are often required. The patient must be carefully protected from exposure to cold for a week or two after the

disease has apparently disappeared, as the lungs and mucous coat of the bowels are for some time very susceptible to inflammatory attacks.

Except for the lesions of the skin there are no characteristic pathological changes in measles. As in other infectious diseases, degenerations in the internal organs, especially in the kidneys, are not uncommon. Otitis media, catarrhal or purulent, is a frequent complication. The process may extend to the mastoid cells, necessitating operation; or a chronic running ear may be left, with partial destruction of the drum and varying degrees of deafness.

Measles is looked upon by the laity as a mild affection, but when it is considered that between 12,000 and 15,000 deaths occur from it every year in the United States, this attitude is hardly justified. The mortality in different epidemics varies between 3 and 50 per cent. Among the well-cared-for and vigorous children of the better classes the disease is not severe, but among the poor, and especially in children living in charitable institutions, it is a veritable scourge. The younger the child, the worse the prognosis. There is a malignant type of the disease, called hemorrhagic, or "black" measles, characterized by a continuously high temperature (107° – 109° F.) and subcutaneous hemorrhages, which is almost invariably fatal. As to the specific cause of the disease nothing is definitely known. Canon and Rielicke in 1892 reported the discovery in 14 cases of measles of a peculiar bacillus found in the blood, more rarely in the catarrhal exudate, which they considered specific. These observations as yet lack confirmation. The specific agent, which is believed to be an ultramicroscopic organism, has not been isolated. Consult Henry Koplik, *Diseases of Infancy and Childhood* (3d ed., New York, 1910), and John Rührh, *A Manual of the Diseases of Infancy and Childhood* (4th ed., Philadelphia, 1914).

MEASLES, FRENCH OR GERMAN. See GERMAN MEASLES.

MEASURE (OF, Fr. *mesure*, from Lat. *mensura*, measure, from *metiri*, to measure). In music, the smallest metrical division of a movement or piece, represented by the notes or rests comprised within two successive bars of the staff. The time value of a measure is a fixed unit, depending on the character of the time which governs the movement. See **MUSICAL NOTATION**, *The Bar*.

MEASURE FOR MEASURE. A comedy by Shakespeare, produced in 1604, printed in 1623. The plot is found in Cinthio's "Hecatommithi," in the romance and tragedy *Epitia*. It was used by G. Whetstone in his play *Promos and Cassandra* (1578) and in his prose tales *Heptameron of Civil Discourses* (1582). If Shakespeare used that version, he took from it merely the outline, and may have known the original. The play belongs to the period of *Othello*, *Hamlet* (the revised), and *King Lear*, which Darnesteter calls his pessimistic period. Though called a comedy, it is gloomy, brightened only by the character of Isabella. After the Restoration it was revised and altered by D'Avenant as *The Law against Lovers* (1662), and later adapted by Gildon (1700).

MEASUREMENT OF SHIPS FOR TONNAGE. The measurement of ships to determine their tonnage (q.v.) is now made in practically the same way by all maritime nations. The old rule in the United States was established by Act of

Congress in 1799. This provided that the tonnage should be ascertained as follows: from the extreme length in feet deduct three-fourths the breadth; multiply the remainder thus obtained by the breadth and this product by the depth; divide the last product by 95 and the quotient was the register tonnage for payment of dues. In this rule the depth of a double-decked vessel was arbitrarily assumed as one-half the breadth, so that it was to the interest of ship-owners to build deep ships without much regard to the effect of the deepening upon other qualities. In Great Britain a somewhat similar rule obtained. The square of the breadth was multiplied by the inboard length and the product divided by 94. This rule had the same effect on ship construction as that of the United States; and the rule is still sometimes employed in yacht and pleasure-boat measurement. Tonnage so obtained is designated as old measurement; thus, 320 tons (O.M.).

In 1835, through the efforts of Mr. Moorsom, an Act of Parliament provided for a more accurate determination of the tonnage of vessels. Instead of a thumb rule which might be—and usually was—very much in error, the measurement of the cubic contents of vessels was effected in accordance with Newton's theorem for the determination of contents of solids bounded by irregular surfaces. This act was followed by the Merchant Shipping Act of 1854, which is the basis of the present practice throughout the maritime world, though some of its provisions have been modified in England as well as elsewhere.

The method of measuring prescribed in this act and subsequent amendments is as follows: measure the length of the ship on the tonnage deck from the inside of the planking or plating at the extreme forward end at the stem to the inside of the planking or plating at the extreme after end at the stern, and deduct the rake of bow and stern in the thickness of the deck so as to reduce the measurement to the length of the ship at the underside of the deck or tops of the beams. This is the "length on the tonnage deck," which deck is the upper one in all ships which have less than three decks and second deck from below in all others. Divide the length obtained as follows: in ships which have a length on the tonnage deck of 50 feet, this length is divided into 4 equal parts; a length of 50 to 120 feet, into 6 equal parts; 120 to 180 feet, into 8 equal parts; 180 to 225 feet, into 10 equal parts; and over 225, into 12 equal parts. The division marks being established, ascertain the depth at the midship division mark; if it exceeds 16 feet, divide it into 7 equal parts; if 16 feet or less, into 5 equal parts. Measure the inside breadth of the ship at each mark and at the upper part of the depth and number them from top to bottom; multiply the second and fourth by 4 and the third by 2; add these products together and to the sum add the first and fifth; multiply the total by one-third the common interval between the breadths and this product will be deemed the transverse area of the upper part of the section. Divide the lower breadth (between the inner bottom, or upper side of double bottom, and the lower division line) into four parts by equally spaced transverse horizontal lines, measure the breadth at the four new points and at the top of the inner bottom, and proceed as before. The sum of the two areas thus deter-

mined is the total transverse area at the point. The transverse areas at the different points (4, 6, 8, 10, or 12 in number) in the length of the ship being determined, they are to be numbered from forward (or aft, either will do), the forward one being at the extreme forward end of the measured length and the other at its extreme after end. Multiply the second and every even-numbered area (except the last) by 4, and the third and every odd-numbered area (except the first) by 2; add these products together, and to the sum add the first and last if they yield anything; multiply the sum so obtained by one-third the common interval between the areas, and the product will be the cubic contents of the ship below the tonnage deck. Add to this the cubic contents of all inclosed spaces above the tonnage deck, including poop, forecastle, deck-houses, between decks, etc. From the total so obtained the following deductions are made: 1. Space exclusively occupied by the crew and the storage of their clothing, etc.; provided that this space does not exceed 20 per cent of the remaining tonnage of the ship; if it is greater than 20 per cent the excess is to be considered as part of the tonnage space. 2. Space framed in above the upper deck for machinery or for admission of light or air. 3. In vessels propelled wholly by sails, any space set apart and used exclusively for stowage of sails, if not exceeding $2\frac{1}{2}$ per cent of the tonnage of the ship. 4. Any space used exclusively for the accommodation of the master. 5. Any space used exclusively for the working of the helm or of anchor gear or for keeping charts, signals, instruments of navigation, and boatswain's stores. 6. Space occupied by donkey engine and boiler if connected with main pumps of ships. 7. Double bottom when not available for cargo, stores, or fuel. 8. Actual engine room and fire room, including shaft alley, but omitting all space not occupied by engines and boilers or necessary for working them. When the actual engine and fire rooms occupy in paddle vessels 20 to 30 per cent of the gross tonnage the deduction is to be 37 per cent of gross tonnage; when the engine and fire rooms occupy 20 per cent or less the deduction may be 37 per cent of the gross tonnage, or $1\frac{1}{2}$ times the actual engine and fire-room space, the option resting with the board of trade; when the space occupied by the propelling machinery, etc., exceeds 30 per cent of the gross tonnage the deduction to be made is 37 per cent of it, or $1\frac{1}{2}$ times the actual engine and fire-room space, the option remaining with the owners. In the case of screw steamers when the space occupied by the machinery and boilers is 13 to 20 per cent of the gross tonnage the deduction is 32 per cent of that tonnage; when the space occupied is 13 per cent or less the deduction is 32 per cent of the gross tonnage, or $1\frac{3}{4}$ times the actual space, the option remaining with the board of trade; when the space occupied is 20 per cent or more the deduction is 32 per cent or $1\frac{3}{4}$ times the actual space, at the option of the owners.

The total additions and deductions to the tonnage space having been made, the capacity in cubic feet so obtained is divided by 100, and the result is the *register tonnage* (or *net register tonnage*) of the ship. The *gross register tonnage* is obtained by dividing by 100 the total capacity of the hull and deckhouses without deductions.

When, owing to the presence of cargo or other

reason, it is impracticable to measure a vessel as heretofore described, the tonnage is determined as follows: Pass a chain around the hull at the midship section and measure the length under the bottom from the upper deck at one side to the upper deck at the other. Call this the *girth*. Add one-half the girth to one-half the main breadth; square the sum so obtained and multiply the result by the length of the ship from outside the stem to outside the sternpost; multiply this product by .0018 for wooden ships and by .0021 for those built of iron or steel.

By the Act of Congress of May 6, 1864 (taking effect Jan. 1, 1865), the United States adopted the English system with slight changes in details which are thought to conduce to greater accuracy. This act has been supplemented by several others, notably that of March 2, 1895, which makes the American practice almost identical with the English; indeed, the wording of the law is generally the same throughout. In measuring, however, the United States law divides vessels into six classes according to length, and the divisions in each class for measurement of transverse areas are: In Class 1 (vessels under 50 feet length on the tonnage deck) the length is divided into 6 equal parts; in Class 2 (vessels 50 to 100 feet long), 8 equal parts; in Class 3 (vessels 100 to 150 feet long), 10 equal parts; in Class 4 (vessels 150 to 200 feet long), 12 equal parts; in Class 5 (vessels 200 to 250 feet long), 14 equal parts; in Class 6 (vessels over 250 feet long), 16 equal parts. The method of measuring and computing net and gross tonnage is the same as that already described. Two other differences exist. One is the omission from the American act of that paragraph of the British law which provides for the measurement of deck cargoes and adds to the tonnage (for the purpose of determining tonnage taxes) all uncovered or other space occupied by deck cargo. The second point of difference relates to shelter-deck spaces and arises from a provision in section 4151, Revised Statutes (Act of Feb. 28, 1865), by which no part of any vessel used for "cabins or state-rooms, and constructed entirely above the first deck which is not a deck to the hull" is to be measured. This provision seems to have been designed to meet the exceptional conditions of light-draft boats on the western rivers; but as this fact is not stated in the act, the procedure has been applied to all vessels.
